I will not stop now, because it would require too much time, to answer every fling which every member sees fit to make in regard to the Committee on Rules and the Committee on Appropriations. The concluding remarks of the gentleman from Mississippi [Mr. CHALMERS] amount to nothing so far as I am concerned, except to prove that he was the victim of a crude conclusion that had no warrant at all in fact. At the time to which he refers I was, as I am now, in favor of the amendment which he has proposed. I believe that it was the duty of the House, and one which we could not well get around, to fill this blank in some wise.

You have created this committee and made it a standing committee of this House. You have assigned it no duty; you have given it no power; you have required of it no service. You must put something here in the rules in regard to that matter. I was from the first and I am still in favor of the amendment offered by the gentleman from Mississippi, [Mr. CHALMERS,] which gives to the Committee on the Levees and Improvements of the Mississippi River absolute charge of the subject of the improvement of the navigation of the Mississippi River and its tributaries.

It is indeed, sir, a work vast enough in its volume and importance to engage the whole attention of any one committee of this House. I will not be driven from that position. I favor it now. I never was committed, as the gentleman may have considered me, to a general disintegration of the legislation of Congress. I never offered any amendment, as he says he construed it, upholding and supporting the view that he happens to hold. I have said, and I say again, (I hope I shall not find it necessary to repeat it a third or a fourth time,) that I was perfectly willing from the first to take all these appropriation bills away from the Committee on Appropriations and give them to the committees having charge of the respective subjects, provided the House would exercise some degree of caution and put some limitation upon the aggregate amount that was to be appropriated.

I did offer a resolution by way of amendment at the beginning of this Congress, looking not to the distribution of appropriation bills, but to the raising of a select committee of five, whose duty should be to revise, condense, and simplify the whole system of rules by which this House has been governed—that and nothing more. I have not changed my position upon that general proposition, nor upon the question now under consideration, one iota. I believe that the amendment offered by the gentleman from Mississippi ought to be adopted. I believe that the work it will impose upon that committee is of such proportion and magnitude as to commend itself to the soundest judgment and best discretion of this House. I hope that the amendment will be adopted.

[Here the hammer fell.]

Mr. FRYE. I would like to ask the gentleman from Kentucky—

Mr. BLACKBURN. I desire simply to add, though it may not be necessary, that in what I have said upon this amendment I do not speak for the Committee on Rules, but for myself.

Mr. FRYE. I desire to ask the gentleman this question, whether he is in favor of providing that the committee now under consideration shall report, like the Committee on Commerce, directly to the House instead of reporting to the Appropriations Committee?

Mr. BLACKBURN. I answer the gentleman very frankly that I would put that limitation upon this amendment, if it shall indeed prevail.

Mr. FRYE. Mr. Chairman, I am ready to admit at any time that the majority of the House is generally right. I have little confidence in my own judgment when I find the majority—at any rate on my own side—voting against me. But I would fail in my duty if I did not call the attention of the House, and especially of my side of the House, to some facts upon this question. There have been a dozen, or possibly twenty, amendments proposed to the report of the Committee on Rules, a large majority of which have failed. Then there came a pretty earnest contest as to whether the Committee on Military Affairs, the Committee on the Post-Office and Post-Roads, and the Committee on Naval Affairs should have a right to report appropriation bills relating to their respective subjects. The majority of this House said “no,” that this business should remain in the hands of the Appropriations Committee. Why? Because economy requires that it should be there. But the Committee on Rules reported a provision that the Committee on Commerce, having in its hands one of the largest appropriation bills, should make its report to the Committee on Appropriations; and the spectacle was exhibited here of a majority of two-thirds declaring that this bill should be reported by the Committee on Commerce directly to the House at any time. Why? If the Committee on Military Affairs is to be compelled by a majority vote of this House to allow the Committee on Appropria-

tions to report the appropriations for the Army, why is the Committee on Commerce by a two-thirds vote allowed to make its report directly to the House, and thus have an opportunity to suspend the rules and put the bill on its passage without any examination or discussion whatsoever? There is some reason for it.

Then we come to the next committee which was able to carry an amendment through this House. What was it? The Committee on Public Buildings and Grounds. They make a proposition that they may be permitted to report directly to this House, and it is carried by a majority of a dozen or fifteen. Why?

Mr. BARBER. Because we had them. [Laughter.]

Mr. FRYE. That is it exactly. And it is only offering another opportunity for scandal to be thrown upon the Congress of the United States. How is it so many men are willing that these two committees—one having in charge rivers and harbors, the other the public buildings in our respective districts—shall have the advantage of every other committee of this House? How is it that the advantage thus given to these committees is refused to the other committees?

Mr. REAGAN. Will the gentleman allow me to ask a question? He has referred once before to the “scandal” brought upon this House by the Committee on Commerce. Will he be frank enough to mention one fact upon which that “scandal” was based? Was it based on anything except the wild declamation of members on this floor, in violation of truth?

Mr. FRYE. “Only this, and nothing more,” that the river and harbor bill is the only appropriation bill brought before this House to be passed under a suspension of the rules and without debate.

Mr. REAGAN. Oh, no. At the last session we passed another appropriation bill under a suspension of the rules—a bill appropriating \$24,000,000 or more; and the gentleman supported that bill. Has there been any “scandal” about that?

Mr. FRYE. Every year for the last five years, until it has become the custom, the motion has been made to suspend the rules and pass the river and harbor bill; and the chairman of the Committee on Commerce knows the reason to be that there are so many gentlemen in this House interested in the passage of the bill that the requisite number of votes can be had.

Mr. REAGAN. Is it “scandal” to pass any bill in conformity with the rules, when those rules require a two-third vote?

Mr. FRYE. Now, Mr. Chairman, one word further. Here comes another committee—the Committee on Mississippi Levees, and, as the amendment proposes, the tributaries of the Mississippi River. The proposition is to take one-half of all the internal improvements of this country and let this committee report upon them. Now, this proposition will pass.

A MEMBER. Oh, no.

Mr. FRYE. Why not? I assume that it will. You will then have two committees reporting river and harbor improvements; two committees can manage them infinitely better than one! Each committee can move to suspend the rules and pass its bill—first the Committee on Public Buildings and Grounds, then the Committee on Commerce, then the Committee on Mississippi Levees. Day after day you will come in here with your bills making large appropriations of money; you will suspend the rules, and pass them. If you take this away from the Committee on Appropriations, take everything away from them. Let the rest of these committees stand upon the same basis on which these three committees stand.

[Here the hammer fell.]

Mr. JOHNSTON. Mr. Chairman, I understand that the Committee on Commerce is now charged with the improvement of the branches of the Mississippi River, and the Committee on the Improvement of the Mississippi with that of the main stream. I submit to gentlemen in the matter of internal improvements those two subjects form but one. Any experienced engineer will, I think, tell you so, and that you cannot have two systems, one for the improvement of the main stream and another for the improvement of its branches. It is absolutely necessary the same authority should control the improvement of the waters of the whole Mississippi Valley.

This appears to me to be too evident to require argument; but there is one important fact I will state in that connection. One of the best engineers, whose opinion has been published in regard to the manner of improving the Mississippi River, proposes to do it by using the current of the stream. Unless those who operate in that way have also the control of the waters of the branches of the Mississippi, the engineer who may be engaged in improving the main stream may cause a bar to form in the mouth of every tributary, for in removing a bar which is above the Arkansas, for instance, by the current of the Mississippi he may remove that bar into the mouth of the Arkansas River. And so of any other river. That of itself to me is a conclusive argument why the amendment proposed by my friend from Mississippi [Mr. CHALMERS] should be adopted, uniting those two subjects, as they should be, under one authority.

Mr. ROBERTSON. Mr. Chairman, I wish to reply to some remarks which have just fallen from the lips of the gentleman from Texas, chairman of the Committee on Commerce. He stated to this House that the members of the Committee on Levees and Improvements of

the Mississippi River had thrown every obstacle in the way of the Committee on Commerce in carrying out the object of that committee in passing river and harbor appropriation bills reported from that committee. In other words, sir, he made the assertion that the members of the Committee on Levees and Improvements of the Mississippi had thrown obstructions in the way of the Committee on Commerce in executing the policy of that committee in improving the rivers and harbors of this country. Now, as far as I am concerned I deny the statement. I deny, sir, that I have ever opposed the Committee on Commerce in carrying out its policy whenever, in my judgment, that committee reported a bill which I could conscientiously vote for.

I am in favor, Mr. Chairman, of the policy of improving the rivers and harbors of the country. In doing so I subscribe to the doctrine of the old democratic party of opposition to any general system of internal improvements. That doctrine grew out, as is well known by gentlemen, of the question of building post-roads and carrying out every sort of local internal improvements in the country, to be paid for by direct appropriation out of the Treasury of the United States. But it is quite a different proposition to improve the navigable streams of the country. It is quite a different thing to appropriate for the improvement of navigable rivers and harbors. Consequently I have always been in favor of the policy of improving the rivers and harbors of the country, and have cheerfully voted for all bills for that purpose reported to this House when, after examination of the items, I have been satisfied the appropriations were to be applied really to the improvement of navigable streams. It is, in my judgment, within the legitimate province of the Government to make appropriations for such purpose and to continue to make them hereafter, as they have been made from the very beginning of the Government.

The gentleman states further that by dividing the jurisdiction, particularly in reference to the improvement of rivers and harbors, we thereby jeopardize the passage of any bill which may be brought before the House for such improvements, and, therefore, experience has shown the absolute necessity of bringing in an omnibus bill combining all interests throughout the country and putting it upon its passage under a suspension of the rules, without amendment and without debate. That of itself at once shows such a system would be nothing more than *log-rolling*. I am opposed to any such system of making appropriations in this House. I am opposed on general principle to bringing any bill before the House which cannot stand upon its own merits and bear discussion.

We say that if the jurisdiction is extended to our committee which it should have it will then give to us the control of a general system of improvement of the Mississippi River and its tributaries. As has been stated very correctly by my colleague on the committee, the gentleman from Virginia, [Mr. JOHNSTON,] the committee having jurisdiction over the main stream of the river should also have jurisdiction over the improvement of its tributaries, because any general system of improvement which may be adopted after investigation, should go not only to the river itself but to all its tributaries.

And why, sir, cannot such a bill as that be passed? We have already passed a law which was not included in any river and harbor appropriation, but passed independently after discussion in this House, appropriating or binding the Government of the United States to pay some \$5,500,000 for the improvement of the mouth of the Mississippi River. I refer to the appropriation to carry into effect the contract with Captain James B. Eads to deepen the South Pass of the Mississippi River, which has already borne such important fruits. That bill was thoroughly discussed. It was before the House and it passed upon its merits.

Now, sir, I object to the practice which has been pursued in reference to these river and harbor bills, on estimates or without estimates of the engineers, making appropriations of money here and there for the improvement of the Mississippi River and its tributaries. What good has been done? What advantage has the navigation of the Mississippi River reaped from general appropriations, scattered as they have been from bar to bar and from point to point without any uniform plan, with no general system? What advantage has it been to the improvement of the river? None whatever. It is necessary, if any advantage is to accrue, we should adopt a general system for the improvement of the river and its tributaries.

Besides, sir, our committee has already exercised appropriate jurisdiction over the Mississippi River, and has reported a bill to this House, which has become a law, by which a commission has been established to make the estimates and bring in a report to Congress in reference to a general system of improvement for this river from its headwaters to the head of the passes at its mouth.

The gentlemen on this floor who have cast reflections on this committee have shown zeal without knowledge in their comments on its origin and action. They have misunderstood or misrepresented both. This committee originated in a great want equally felt in this House and in the great communities directly interested in the free navigation of this mighty inland artery. It was because it was found that the existing committees were not adequate to grapple with this question in its full extent, and to bestow upon it the time and labor requisite for a full understanding of the whole question, that the Committee on

Levees and Improvements of the Mississippi River was created by this House, and its works can speak for it, short as has been the term of its existence. This is not, and never has been since the first session of the Forty-fifth Congress, a mere levee committee, nor the representative of mere local interests. Its scope has been broader and wider, embracing not alone the question of the levees or alluvial lands, but all questions connected with the improvement of the navigation of the river. Although its duties have never been technically defined in the rules themselves, yet the very title given to the committee defines the jurisdiction, duties, and powers intended to be conferred by this House upon it, the free exercise of which this House has repeatedly sanctioned by its action. Considering the great national importance of the matters confided to it, this committee has investigated thoroughly the whole subject, and after mature deliberation came to the unanimous conclusion that no piecemeal legislation, made up out of petty appropriations here and there, to conciliate local interests, no log-rolling job, would meet the wants and wishes of the great community who dwell on its banks or those of its tributaries, or the still greater multitude whose interests are directly connected with it.

In the course of their investigations they found that this stream had been long neglected and its importance never thoroughly understood, owing to the obstruction of the bar at its mouth, now happily removed. They also found that, although surveys had been made of isolated portions by Army engineers and the Coast Survey, no general system, plan, or theory of improvement had been agreed or acted upon; and it was to supply this great want and provide for a general system of improvement, including the permanent location and deepening of the channel, and protection of its banks against overflow, that the committee reported the bill, now a law, for surveying, examining, and reporting some definite plan to cover these objects. That commission has been and still is at work in maturing a plan and solving the great problem which has so long agitated the country and on which heretofore there has been such a diversity of opinion. When that report shall be submitted to this House, would it be fair or proper or just to this committee and to the House which clothed it with these powers and sanctioned its action, to cast a slur upon the committee, and stultify itself by depriving it of its powers, on the very threshold of its execution, by turning the matter over to another committee hitherto unconnected with it, except incidentally by its general jurisdiction over commerce, and necessarily uninformed on this special subject-matter. The whole opposition to giving its just jurisdiction to this committee seems based on the fact that certain local interests might be prejudiced, or combinations prevented, for securing benefits for certain localities through personal arrangements.

I am perfectly satisfied that it is the general sentiment throughout the country, as I believe it is on the floor of this House, and all the indications of public opinion, outside of a narrow and unstatesmanlike view of local interests, go to confirm it—that the creation and work of this committee have been eminently wise and useful, and that it should be encouraged and aided in perfecting the great work which has been so well begun. Large and influential conventions indorsing and approving its labors have been held at different points in the Mississippi Valley and elsewhere, and urgent calls have been made upon Congress to persevere on the path in which it has commenced its progress. While I cheerfully concede to the Committee on Commerce all the credit justly its due, for the ability which it has manifested in the performance of the duties assigned to it, I must yet insist that as regards this special subject they have never yet had the opportunity of devoting to it the time and investigation necessary to a full comprehension of it, and could not possibly, in the midst of their multifarious duties, bestow upon it the time and attention necessary to such a thorough understanding of so complex a question. For, should this question, which has been so thoroughly investigated by the committee to which it has been specially assigned, be relegated to another committee, to whom it will be a comparatively new question, the whole work will have to be gone over, and long and unnecessary delays created, of infinite detriment to the great public interests, if not to the defeat and destruction of the end in view. Although it is true that in this matter I am representing the interests and the views of my own immediate constituents, yet, sir, I claim also to represent a far wider field and a much larger constituency as well. This is no narrow local interest which the committee of which I have the honor to be chairman represents and was created to guard and foster. It is as wide and as deep as the great river which washes the shores of an empire in extent, production, and population, whose wants and wishes have found their true exponent in the committee appointed to meet and answer them, without touching or trenching on the rights of other members of this great family of States—separate like the billows, but one as the sea.

The voice of the people of the Mississippi Valley has come up here through their conventions like the roar of the waters of their great river, and that voice has been one of approval of the action of the House in creating a special guardian of their interests and those of the entire country, which are equally enlisted in the perfection of the work so happily begun. It is easier to destroy than to create, and the work of destruction advocated by those who are jealous of or misunderstand our work can, if successful, result only in mischief, not in good.

The chairman of the Committee on Commerce is a strong man, but there was once a man stronger than he, who pulled down a structure stronger than even ours. Yet he should take warning from the fate of Samson, and seek to aid us in rebuilding, not task his strength in the work of pulling down that which even he might and would prove incompetent to rebuild.

Mr. Chairman, I leave the decision of this question in the hands of the House, confident that it will not lend itself to the child's play of pulling down one day its work of the day before.

[Here the hammer fell.]

Mr. ROBESON. Mr. Chairman, I am in favor of internal improvements. I believe in developing the resources of this country, but I think I see in this proposition one of such magnitude as to require more careful consideration than we are likely to give it to-day. If it be what I believe it is, I think we should stand hesitating on the brink of the Mississippi before we plunge in. The Mississippi and its tributaries! How simple in expression, how comprehensive in effect! Stretching from the Alleghanies to the great Father of Waters on the one hand, and from the Rocky Mountains down the channel of the Missouri and its tributaries on the other! A stream which covers all the internal relations of this great country. Every great river which flows from the North to the South to be submitted to this committee which was organized for the purpose of establishing and carrying on the levees at the mouth of the Mississippi River!

Mr. Chairman, I believe in giving liberal appropriations for the improvement of that great delta, but I do not believe in making every improvement in every river in the North, in the East, or in the West dependent upon how much we are willing to vote for the levees of the Mississippi River. You who live on the Wabash, you who live on the Allegheny, you who live on the Monongahela, you who live on the Missouri, or the Ohio, or any other river which flows into that great stream, are your appropriations and your improvements to be dependent on the committee which is charged only and organized to be charged only with the duties of establishing and maintaining the levees at the mouth of the Mississippi River?

Mr. ROBERTSON. Will the gentleman permit me to interrupt him for a moment?

Mr. ROBESON. I am through.

Mr. COX. I think, Mr. Chairman, that this debate is useful. It ought not to be suppressed all at once, especially after the magnificent remarks made by the gentleman from New Jersey. I am in favor of the proposition of my friend from Mississippi. Why?

A MEMBER. Of course you are.

Mr. COX. I am not speaking ironically. [Laughter.] I want to see commerce divided. I want to see a unity given to one subject, to wit, the Mississippi River and its tributaries. Why, my friend from Missouri, in offering his amendment a moment ago, told us that the Committee on Commerce was so busy, so engrossed, so overwhelmed with business, that they could not take care of a deflection in the Saint Charles River. I knew that it was in danger of catalepsy. [Laughter.] I knew that they should be relieved, but I was not prepared to believe that my friend from Mississippi was to be the great "medicine man" to afford relief so promptly. [Laughter.]

What is the Mississippi River? Three thousand six hundred miles, and with its tributaries, the Missouri, the Ohio, and others, spreading everywhere, ten thousand miles, all borne along by the great law of gravitation, bearing down our produce to the ocean. And I am not sure, sir, when I reflect how much of our soil is held in solution by this river, as well as by the Missouri, that this question of the levees of the river should not be referred to the Committee on Agriculture. [Laughter.] I think a reasonable proportion of this business should go to the Agricultural Committee.

We have sent abroad this year four hundred millions of bushels of wheat. Our commerce has done that. Why not turn over commerce to the Committee on Agriculture? It is our Navy that protects our commerce. Why not turn over our naval affairs to the Committee on Agriculture? Why not turn the militia over to the Committee on Agriculture; for how can you equip the militia except with corn-stalks? All these things at least tend toward that great element in the industries of our country which gives 87½ per cent. of all the products which we send abroad. Agriculture is our paramount interest. Let us combine commerce, buildings and grounds—grounds—and all these other interests in one grand, magnificent committee at the head of which stands my distinguished friend from Ohio, General LE FEVRE. And then we will see unity in the administration of our affairs.

Mr. WHITE. It is your colleague, Mr. COVERT, who stands at the head of that committee.

Mr. COX. I was thinking of the investigating committee. My distinguished colleague, I know, is engaged in agriculture. He represents also another sort of industry on the coast connected with fishing.

But the Committee on Commerce has absorbed nearly everything. Why, sir, the gentleman from Louisiana, the other day, from the Committee on Commerce, actually reported a bill here about the telephone. The next thing we will hear about the Committee on Commerce they will be after the telescope, the megaphone, the transit of Venus—everything connected with scientific improvement—all will go to my distinguished friend from Texas, [Mr. REAGAN.] [Laughter.]

The gentleman from Texas undertook to tell us something about the "dog under the wagon." I would like to see the watch-dog of the Treasury under every one of the wagons that are depleting the Treasury; the wagon that is taking from the Treasury the contents of its strong box; the wagon which, under the log-rolling system, in spite of all my friend says, without debate, without possibility of amendment, by a vote of two-thirds, in defiance of every legislative canon known to civilized governments, provides appropriations for all those little streams within the States, not like the Father of Waters and its tributaries, not like the great lakes or the harbors on the Atlantic coast, but all the contemptible little streams, the appropriations for which fill sixteen pages of the Statutes at Large and do no good except to help a few men in their congressional districts.

[Here the hammer fell.]

Mr. FRYE. I desire to offer a substitute so that there may be some other proposition for the Committee of the Whole to discuss.

The CHAIRMAN. Does the gentleman desire to debate it now?

Mr. FRYE. I wish it to be read that gentlemen may have an opportunity of discussing it.

The Clerk read as follows:

Fill the blank as follows:

"To the levees of the Mississippi River."

So that the clause will read, if the amendment be adopted:

"To the levees of the Mississippi River: to the Committee on Levees and Improvements of the Mississippi River."

Mr. HAWLEY. I desire to protest against the proposition of the gentleman from Mississippi, [Mr. CHALMERS.] I am aware I have spoken frequently, but I cannot permit this to pass without saying at least a word. I shall do it in one minute, and then shall give the rest of my time to the gentleman from Kansas, [Mr. HASKELL.]

This Mississippi business was started by referring the subject to a committee on the levees. And now it is understood everywhere in this House that the question to be decided is whether or not we will embark on a policy which involves an expenditure of \$500,000,000. That is the question that is to be settled. We have an able commission investigating the subject, and we can wait for its report. The country desires to be fair and liberal in this matter. Let us get that report, and let us decide upon a broad and general policy. But we are not in a position to do so as yet. We have not the information now.

Before we have heard the first report from the commission we have here a rule establishing a permanent committee on improvements of the Mississippi River, and, moreover, adding to that river every one of its tributaries from the Alleghanies to the Rocky Mountains, and north to Lake Winnipeg. All is to be put under the care of one magnificent committee, and at the same time they are to have the power to report their own appropriations.

I say again the power to order the work to be done and the distribution of the money should be in different hands. If the pending proposition be adopted we are giving to this committee the grandest opportunity for log-rolling that was ever offered by the American Congress. It is proposed that we shall give them the power of appropriating for every Kiskiminetas all along the line when we have not yet decided on the levees. You have not dared to leave the river and harbor bill to the Committee of the Whole. The moment you do that it runs up to fifteen millions; and therefore, for very shame, the river and harbor bill has been taken from the Committee of the Whole and put through on Monday under a suspension of the rules. So with the magnificent bill that would come from this committee. Put it there if you dare; and when every little stream is put in, you cannot for shame pass such a bill except by a two-third vote.

Mr. CHALMERS. We are more than willing that an amendment to the rules should be made that no bill from this committee should pass under a suspension of the rules.

Mr. HAWLEY. That would not do any good. I yield now to the gentleman from Kansas, [Mr. HASKELL.]

The CHAIRMAN. The gentleman has two minutes of his time remaining.

Mr. HASKELL. I have a word or two to say against this proposed amendment of the gentleman from Mississippi. Because I am strongly in favor of the improvement of that river I am sorry to seem for a moment to antagonize that which the friends of the improvement of the Mississippi River place before this House. I object to this amendment not because I am an enemy to that improvement, but because I am a friend of it. It is proposed to divide the Committee on Commerce into two committees—to create two independent committees, each one charged with the subject of improvements, enough, if carried out, to entirely absorb and profitably absorb all the surplus revenues of the Government.

There will surely be a conflict of interest between those two committees. Should the Committee on the Mississippi River and its Tributaries bring in here a bill appropriating the amount which in their judgment they may deem to be wise for the improvement of that river and its tributaries, the sum will be so large that when the Committee on Commerce shall report its regular bill the conservative members of the House will be obliged to defeat both of the bills. That will almost surely be the result.

One committee, and one only, ought to have charge of the whole sub-

ject of the improvement of the navigable waters of the United States. Is it fair to assume that the Committee on Commerce, presided over by a western man and composed of representative men from different portions of the Union, will be less favorable to a wise improvement of one of our important navigable streams than will be a certain other committee? Is it necessary that all these wise, economical, prudent schemes for the improvement of the business of this country shall be parceled out to separate committees? If that is done, then, as a matter of practical parliamentary legislative result, we will find ourselves here on this floor quarreling about questions of jurisdiction, quarreling as to the amounts which we have received each for his favorite scheme. And the bills for those purposes will be so overloaded that the whole business will break down in one crash. That will be the result of it.

[Here the hammer fell.]

Mr. TOWNSHEND, of Illinois. I move that the committee now rise.

Mr. BLACKBURN. In view of the fact that there has been such unlimited discussion on the pending amendment, and that the gentleman from Louisiana [Mr. GIBSON] desires to be heard, I ask my friend from Illinois [Mr. TOWNSHEND] not to press at this time his motion that the committee rise.

Mr. TOWNSHEND, of Illinois. There are others here who desire to be heard.

The CHAIRMAN. The committee will resume the consideration of this matter when it next meets. The question is upon the motion of the gentleman from Illinois [Mr. TOWNSHEND] that the committee now rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the proposed revision of the rules reported from the Committee on Rules and had come to no resolution thereon.

* * * * *

FEBRUARY 11, 1880.

* * * * *

ORDER OF BUSINESS.

Mr. BLACKBURN. I move that the House resolve itself into Committee of the Whole on the state of the Union for the purpose of resuming consideration of the report of the Committee on Rules; and, pending that motion, I move that all debate on clause 21 of Rule XI now under consideration, and amendments thereto, be limited to ten minutes.

The motion to limit debate was agreed to.

Mr. BLACKBURN moved to reconsider the vote just taken; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The motion that the House resolve itself into Committee of the Whole was agreed to.

REVISION OF RULES.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, (Mr. CARLISLE in the chair,) and resumed consideration of the report of the Committee on Rules.

The CHAIRMAN. The pending question is upon the amendment proposed by the gentleman from Maine [Mr. FRYE] as a substitute for the amendment proposed by the gentleman from Mississippi [Mr. CHALMERS] to clause 21 of Rule XI. The Clerk will read the clause and the proposed amendments.

The clause and the proposed amendments were read.

The pending clause was as follows:

21. — to the Committee on Levees and Improvements of the Mississippi River.

The blank in the clause, it was moved by Mr. CHALMERS, should be filled by the words:

To the improvement of the Mississippi River and its tributaries, and all surveys and estimates relating thereto.

For which Mr. FRYE had proposed as a substitute the words:

To the levees of the Mississippi River.

Mr. GIBSON. I had an amendment pending which I ask shall now be read.

The CHAIRMAN. The Clerk will report the amendment offered by the gentleman from Louisiana, and the Chair will determine if it is in order.

The Clerk read as follows:

In Rule X, line 24, strike out "levees and" and insert "and its tributaries;" so that it will read:

"On improvement of the Mississippi River and its tributaries, to consist of thirteen members."

The CHAIRMAN. The amendment which the gentleman from Louisiana [Mr. GIBSON] has sent up is to a rule which has been passed

in the committee; but, according to the recollection of the Chair, the consideration of the amendment was postponed until the committee should reach clause 21 of Rule XI.

Mr. GIBSON. I have observed, Mr. Chairman, that many misapprehensions exist with regard to the origin, scope, and powers of this committee. I think I may remove them by briefly stating the history of this committee.

Since the acquisition of the Territory of Louisiana, which embraces seventeen States and Territories, the improvement of the Mississippi River has been a question before the Congress of the United States.

The rapid extension of our population into the valley of the Mississippi, the growth of its agricultural and commercial interests, and, within the last few years, the application of modern machinery and improved methods of agriculture, have developed the resources of the Mississippi Valley so that the people of that section demand that they shall receive consideration at the hands of the Congress of the United States.

The Government of the United States donated to the States along the Mississippi River all the public lands that were liable to overflow by that river, in order that the proceeds arising from the sales of those lands should be devoted to the purpose of improving the river. Since then, at every Congress, we have appointed special committee after special committee to take this matter into consideration. It was not, however, until the Forty-fourth Congress that, on my motion, a committee was authorized and appointed, to be one of the standing committees of this House, to take this subject into consideration and to bring it in some authoritative manner before the House of Representatives.

Within the last few years new ideas have been developed in regard to the treatment of the Mississippi River. The success of Captain J. B. Eads in constructing jetties at the mouth of that river has established beyond controversy the fact that as you confine the waters of this stream it deepens its channel. This is an important fact, and the people of that section of the country feel that it has been established by a scientific process that the levees and jetties were instruments of commerce. In the language of the engineers of the United States, in a communication addressed to the Chief of Engineers, the improvement of the navigation of the Mississippi River and the levees of the Mississippi River are inseparably connected as interdependent.

Hence it was that in the Forty-fifth Congress on my resolution this committee was constituted a committee on the improvement of the Mississippi River. We now insist that the committee should also have jurisdiction of the tributaries of the Mississippi River. And how are we confronted? On the one hand the chairman of the Committee on Commerce [Mr. REAGAN] tells us that if we sever these commercial questions, if we divide the continent between two committees, we will defeat all appropriations for the improvement of our rivers and harbors. Upon what ground does that gentleman plant himself when he makes that statement? It is unmistakably on the ground that if you diminish the ability to log-roll in this House you will defeat the appropriations for the improvement of rivers and harbors.

On the other hand, the gentleman from Connecticut [Mr. HAWLEY] tells us that if we divide this subject between two committees and give the Committee on the Mississippi River jurisdiction over the subject of improving the Mississippi River and its tributaries we will increase the facility of log-rolling and bankrupt the Treasury of the United States. Hence you see the strange spectacle presented of those in favor of log-rolling and who want extravagant appropriations joining hands with gentlemen who declare themselves in favor of rigid economy in order to defeat the constitution of this committee. The friends of this committee are on the one hand not parsimonious economists, nor on the other hand are they in favor of a general system of log-rolling. They believe that the Mississippi River is entitled to consideration at the hands of this House; that its main tributaries are also entitled to fair treatment and justice from members of this House. We believe that if this question stands before the House on its merits it will receive the consideration to which it is entitled, and will secure the appropriations that a sense of justice and a sense of the proprieties of the case will require from the representatives of the people.

I request the members of this House to reflect upon the proposition enunciated the other day by the distinguished gentleman from Virginia, [Mr. JOHNSTON,] when he stated that you could not improve the main channel of the Mississippi River without taking into consideration the tributaries, and you could not improve the tributaries without at the same time—

[Here the hammer fell.]

The CHAIRMAN. The time of the gentleman has expired.

Mr. PHISTER obtained the floor.

Mr. BAYNE. I ask unanimous consent that five minutes' more time be given for debate.

Mr. BLACKBURN. I make the point of order that it is not competent for the Committee of the Whole to extend the time for debate, when the House by its order has placed a limit upon debate.

Mr. BAYNE. I know the time has been limited, but it was understood that I was to have five minutes upon this question.

Mr. BLACKBURN. I am not a party to any such understanding. I do not desire to speak myself, but I do want to stop the talking and go to voting.

Mr. PHISTER. Am I entitled to the floor?

The CHAIRMAN. If the gentleman desires to speak against the pending amendment, he is entitled to the floor.

Mr. PHISTER. "Divide and conquer" is a motto of both military and political warfare. When the daring adventurer, Cortez, invaded Mexico his success in conquering that people was due more to his skill and energy in exciting and utilizing divisions among their chiefs and tribes than to the prowess of himself and his soldiers, great as it was. The schisms and internecine strifes of the inhabitants of Jerusalem caused that great city to fall before the arms of Titus. We read in Aesop's Fables of the contention between the different members of the human body as to their relative importance in maintaining its life and strength and what would have been the fatal result of such folly but for its cessation. In party contests, we know from history and observation that the aim of the competitors is to distract and divide the followers of rival leaders, and thus achieve an assured victory. We witness every day such efforts on the political chess-board.

Such being the philosophy of history and experience, I must be permitted respectfully to express my surprise at the amendment offered on Friday last by the honorable gentleman from Mississippi, [Mr. CHALMERS,] and the same amendment now offered by the honorable gentleman from Louisiana, [Mr. GIBSON.] It comes from, I believe, friends of river and harbor improvements, and I concede that it is prompted by good intentions. But in my humble judgment it is a mistaken, because an unwise policy. The object of the friends of river and harbor improvements should be to unite and concentrate their efforts, and not to divide. In legislation on this subject let the friends of the great Mississippi join with those on the ocean; let the lakes combine with the Gulf, and the Susquehanna and the Delaware with the Ohio, and they will move with a majesty and power that will command the confidence and support of the people, and deserve and achieve success here in necessary, not unduly extravagant, appropriations. But let our counsels be distracted, let our efforts be divided, and they will be defeated, or their success will be uncertain and limited much below what is necessary.

The object of this amendment is to separate the Mississippi River and its tributaries from the balance of the country in legislation for their improvement. While it may apparently give importance to that river, will it not lead to a struggle between its friends and the friends of great improvements in other parts of the country? Will there not thus be a likelihood of each pulling against the other instead of pulling together, and will not almost certain success be in this way turned into defeat? Reasoning from human nature and experience it seems to me that such will be the result of this amendment. *Fas est ab hoste doceri.* We have seen how readily and almost gratefully those opposed to a national system of river and harbor improvements have received this amendment. Let us take warning in time from this action on their part.

Further, the effect of this amendment will be, I fear, to excite and probably create rivalries between the Mississippi itself and its tributaries. And thus, in their divisions, all may fail. My distinguished friend from Virginia, General JOHNSTON, contemplated this matter in an engineering view. In that light it might be best to have the improvement of the Mississippi and its tributaries under one head. Can this not be under a reference to the Committee on Commerce, which is friendly, as well as if to a special committee on the Mississippi and its tributaries? And cannot, and will not, the surveying and engineering of their improvement be under one general management if the Committee on Commerce has charge of the subject?

It would probably be unjust to attribute this amendment to a desire to magnify the Mississippi at the expense of its tributaries. But may not the effect of it be, for the improvement of that great river, to obscure and belittle the improvement of its tributaries, as its channel receives and absorbs the waters of the Ohio and other confluent? In the natural world the great animals destroy and feed upon the smaller ones. The big fish swallow the little ones. And if the Mississippi is thus to diminish and dwarf the importance of its tributaries will they not combine against the monopoly? And in this struggle the great Father of Waters may unfortunately meet a fate not contemplated by its friends.

If this amendment is to pass, why not have a separate committee on the important harbor of New York, another separate committee on the lakes or for each of the great lakes, and so on, and thus have our counsels divided and our labors frittered away in detail?

No, gentlemen, the true policy is to stand together under one committee, to march together in union and harmony under one banner; and then, as has been shown in previous votes on the rules relative to this matter, we can prevail over any opposition. Division is weakness and may end in failure.

Representing, as I do, a district bordering one hundred and thirty miles on the Ohio, and on a greatly important tributary to it, navigable in and between three States for over one hundred miles, and running through a country abounding in timber, coal, and mineral wealth, I can see no advantage in this amendment to useful work in improving those rivers, but probably much injury to them, and must therefore oppose it.

Let me not be misunderstood in another regard. I class myself as a

friend to national river and harbor improvements; but am not in favor indiscriminately of such as are merely local in situation and importance. But wherever a river is a great channel of communication between different parts of the country or has great elements of wealth along its course and runs in or between several States so as to require a combined effort to improve it, there such union and combination can only be successfully achieved through the Federal Government. And in some instances harbors and rivers, though only in one State, may be of such vast importance to the whole country or great sections of it as to be of national significance. The improvement of such rivers and harbors is and should be a national work. And the great Calhoun meant to include the important navigable tributaries when he spoke of the Mississippi as a "great inland sea." Their waters supply it, and it should not pursue a policy that may militate against the importance and improvement of its sources.

[Here the hammer fell.]

The question being taken on the amendment offered by Mr. FRYE as a substitute for the amendment of Mr. CHALMERS, there were—ayes 93, noes 46.

Mr. GIBSON. I call for tellers.

Tellers were ordered; and Mr. GIBSON and Mr. FRYE were appointed.

Mr. DUNNELL. I am satisfied that the question before the committee is not well understood. Perhaps it ought to be stated again.

The CHAIRMAN. The Chair will cause to be read everything pertaining to the pending question. The Clerk will first read the pending clause.

The Clerk read as follows:

21. — to the Committee on Levees and Improvements of the Mississippi River.

The CHAIRMAN. It will be observed that in the clause as reported by the Committee on Rules, the subject to be referred to this committee is left blank. The gentleman from Mississippi [Mr. CHALMERS] proposes to fill that blank by inserting what the Clerk will read.

The Clerk read as follows:

To the improvement of the Mississippi River and its tributaries, and all surveys and estimates relating thereto.

The CHAIRMAN. The gentleman from Maine [Mr. FRYE] proposes to insert as a substitute for the amendment of the gentleman from Mississippi the language which the Clerk will read.

The Clerk read as follows:

To the levees of the Mississippi River.

The CHAIRMAN. The question is now on the adoption of the substitute proposed by the gentleman from Maine.

Mr. ROBERTSON. Is it in order to offer a further amendment?

The CHAIRMAN. It is not in order now. The committee is dividing.

The committee divided; and the tellers reported—ayes 129, noes 41.

So the amendment of Mr. FRYE was agreed to.

Mr. GIBSON. I presume, Mr. Chairman, that my amendment now comes up?

The CHAIRMAN. The Chair understands that the amendment proposed by the gentleman from Louisiana is an amendment to line 24 of Rule X, to which the committee will return as soon as this matter is disposed of. The gentleman from Louisiana [Mr. ROBERTSON] desired, as the Chair understood, to offer a further amendment.

Mr. CHALMERS. The gentleman from Maryland [Mr. McLANE] has an amendment to which I think the gentleman from Louisiana [Mr. ROBERTSON] will assent.

Mr. McLANE. I ask for the reporting of the amendment as it now stands.

The Clerk read as follows:

Insert "to the levees of the Mississippi River;" so that the clause as amended will read: "To the levees of the Mississippi River: to the Committee on Levees and Improvements of the Mississippi River."

Mr. McLANE. I move to amend by striking out the words "to the levees of the Mississippi River," and inserting in lieu thereof the words "the report of the Mississippi River commission." I desire to say a few words in explanation of this amendment.

The CHAIRMAN. The gentleman will remember that by order of the House all debate upon this clause is now closed.

Mr. PRICE. I make a point of order on the amendment of the gentleman from Maryland, that it is not in order to move to strike out what has just been inserted by a vote of the committee.

Mr. McLANE. I move, then, to amend the amendment by adding the words "and the report of the Mississippi River commission."

The CHAIRMAN. The gentleman from Maryland misapprehends perhaps the situation of the question.

Mr. McLANE. Will the Chair explain it?

The CHAIRMAN. The gentleman from Mississippi [Mr. CHALMERS] moved an amendment to insert certain words in the blank left by the Committee on Rules. The gentleman from Maine [Mr. FRYE] proposed a substitute for that amendment, which the Committee of the Whole has just adopted; so that the question is now upon the adoption

of the amendment proposed by the gentleman from Mississippi as amended by the vote of the committee on motion of the gentleman from Maine.

Mr. McLANE. Now I desire to inquire whether the substitute is not open to amendment.

The CHAIRMAN. The gentleman from Maryland now offers a substitute for the substitute which the Committee of the Whole has just adopted.

Mr. McLANE. I suppose I need not offer it as a substitute, but may offer it as an amendment.

The CHAIRMAN. But it is in fact a proposed substitute for the substitute which the committee has just adopted.

Mr. CHALMERS. Not necessarily.

The CHAIRMAN. The gentleman from Maryland will please explain his motion.

Mr. McLANE. I understand the case now to be that the words proposed by the gentleman from Maine have been adopted as a substitute for the words proposed by the gentleman from Mississippi. The latter words have now disappeared, and in lieu thereof stand the words proposed by the gentleman from Maine. Now I propose to amend the substitute as amended by the committee. I take it for granted that the substitute is open to amendment, and as I cannot move to strike out I move to add the words "and the report of the Mississippi River commission." This motion, I think, is strictly within parliamentary rule. In support of this amendment I wish to say a word.

The CHAIRMAN. The Chair did not understand the proposition of the gentleman from Maryland as he now states it. If he proposes now to add the words "and the report of the Mississippi River commission," the Chair will hold the motion to be in order. But that is not the amendment which was sent to the desk and read to the committee.

Mr. McLANE. The amendment I have just stated is the one I desire to offer.

Mr. PRICE. I make the point that debate on the pending clause is closed.

The CHAIRMAN. Debate on this clause is closed by order of the House, and the Chair has no discretion in the matter.

Mr. GIBSON. I rise to a parliamentary inquiry. I had the honor to offer an amendment to line 11 or 12. The order of the committee was that this amendment was to be considered as pending when we should reach line 24. I would like to inquire whether that amendment is not now pending?

The CHAIRMAN. The Chair will state the situation as understood here at the desk. When Rule No. X as reported by the Committee on Rules was under consideration, the gentleman from Louisiana [Mr. GIBSON] proposed an amendment to line 24, and the gentleman from Mississippi, [Mr. CHALMERS], according to the recollection of the Chair, also proposed an amendment to line 25, to increase the number of members of the committee. By unanimous consent, those two amendments were passed over until the committee reached Rule No. XI, which is now under consideration, and should dispose of the clause as proposed by the committee. The Chair intended at all times, as soon as the committee disposed of clause 21, to return to lines 24 and 25 of Rule X, and dispose of the amendments proposed by the gentleman from Louisiana [Mr. GIBSON] and the gentleman from Mississippi, [Mr. CHALMERS.]

Mr. REAGAN. What is the question before the House?

The CHAIRMAN. The amendment of the gentleman from Maryland, [Mr. McLANE.]

Mr. REAGAN. I only rise to say—

The CHAIRMAN. Debate is not in order.

Mr. McLANE. I withdraw my amendment.

Mr. REAGAN. Was the amendment to the amendment of the gentleman from Maine an amendment to it or a substitute for it?

The CHAIRMAN. A substitute for it, and the question remains of filling the blank of the amendment with the number of the committee.

Mr. REAGAN. I wish to understand it. An affirmative vote fills the blank by the word "levees."

The CHAIRMAN. It will, in the manner just adopted by the committee.

Mr. ROBERTSON. I rise to a parliamentary question.

The CHAIRMAN. The gentleman will state it.

Mr. ROBERTSON. Is this the amendment offered by the gentleman from Maryland?

The CHAIRMAN. No; that amendment is withdrawn.

Mr. ROBERTSON. Then I renew it, to come in after the word "levees," and for the sole purpose that this committee shall have the right to take charge of the report of the commission they themselves created. [Cries of "Order!"]

The CHAIRMAN. Debate is not in order, and the question recurs on the amendment to insert the words "and the report of the Mississippi River commission."

Mr. ACKLEN. I should like to ask a parliamentary question. Has that report been made or is it a report yet to be made?

The CHAIRMAN. That is not a parliamentary inquiry.

Mr. ACKLEN. It is a question for information.

The CHAIRMAN. The Chair is not informed whether it is or not.

Mr. ACKLEN. I make this point, that if the amendment refers to a report yet to be made—

The CHAIRMAN. Debate is not in order.

Mr. ROBESON. I ask that the resolution creating the commission and defining its powers be read.

The CHAIRMAN. That is not in order.

Mr. ROBESON. I ask that the proceedings of the House which authorized the commission, whose report is now to be submitted to this committee, and which defines the power of that commission, be read by the Clerk.

The CHAIRMAN. That is a law passed by Congress which every gentleman can see, and its reading would be in the nature of debate, which is prohibited under the rules.

Mr. GIBSON. I hope the gentleman's request will be complied with.

Mr. ROBERTSON. I hope so too.

The CHAIRMAN. It cannot be complied with if objection is made.

Mr. ROBERTSON. I hope it will be complied with to show the gentleman from New Jersey—

The CHAIRMAN. Debate is not in order.

Mr. HAWLEY. It has got to go there anyhow.

Mr. ROBERTSON. If so, then all right. I demand a division of the committee on the amendment I have offered.

The committee divided; and there were—ayes 10, noes 66.

So the amendment to the amendment was rejected.

The question recurred on Mr. CHALMERS's amendment as amended, and it was adopted.

The CHAIRMAN. The Clerk will now return, under the order of the committee, to lines 24 and 25 of Rule X, so as to dispose of the amendments there pending. The amendment of the gentleman from Louisiana [Mr. GIBSON] will first be read.

The Clerk read as follows:

Rule X, line 24, amend by striking out "levees and" and insert "and its tributaries;" so it will read: "on improvement of the Mississippi River and its tributaries, to consist of eleven members."

The amendment was rejected.

The question next recurred on Mr. CHALMERS's amendment; which was read, as follows:

Strike out "eleven" and insert "thirteen;" so it will read, "on levees and improvement of the Mississippi River, to consist of thirteen members."

The amendment was rejected.

The CHAIRMAN. The Clerk will now return to Rule XI, clause 22.

The Clerk read as follows:

22. To education and labor: to the Committee on Education and Labor.
23. To the militia of the several States: to the Committee on the Militia.
24. To patents: to the Committee on Patents.

Mr. VANCE. I move to amend so it will read, "and that the Committee on Patents shall receive the estimates and report the appropriation bills for the support of the United States Patent Office."

Mr. Chairman, the Committee of the Whole have directed that the Committee on Agriculture, the Committee on Public Buildings and Grounds, and the Committee on Commerce shall have control of the appropriation bills for all matters pertaining to those different departments. I think it is equally important that the Committee on Patents should have control of, and report, appropriation bills for the support of the United States Patent Office.

It will be borne in mind, Mr. Chairman, that the country is not taxed to support the Patent Office of the United States. There is not a dollar of tax laid upon the people of this country for its maintenance or support. It is supported by the inventors of the country. The report of the Commissioner of Patents for the year 1879 shows that there were applications for patents amounting to 19,300; applications for design-patents, 697; for the reissue of patents, 639; for registration of trade-marks, 1,465; patents granted, (including reissues, designs, &c.,) 12,471; labels registered, 403.

The total receipts of the Patent Office for the year 1879 aggregate, according to this report of the Commissioner of Patents, \$703,146.79. Of this amount there was expended for the Patent Office itself, \$548,651.47, showing an excess of receipts above the expenditures of \$154,495.32.

Now, sir, I think it is a reasonable proposition, as the Patent Office is supported by the money paid into it by the inventors of the whole country, that the Committee on Patents should have exclusive jurisdiction and control of the legislation affecting this great interest. While it is admitted that the interests of agriculture are of great importance to the country, it cannot be denied that the development of the country, and the development to a large extent of agriculture itself, are greatly indebted to the success of our system of patents. The interests of agriculture in this country have been greatly enhanced by the development of the patent system. There is no one department of this Government which has done more for the material welfare and prosperity of the people than that. The million of bushels of grain, of corn, wheat, and every other kind of grain known to our agricultural interests have been added to and increased by the invention and successful operation of labor-saving machinery, fostered, as such inventions have been, by the patent laws of this country. I think it is true that the appropri-

tions for the Patent Office for many years were reported by the Committee on Patents, and I see no reason why they should not continue to be reported by that committee.

At the present time it is very important that the Committee on Patents should have control of the appropriations, from the fact that I hold in my hand the report of the Commissioner of Patents which states that he has not under his control a sufficient force to do the work of the office, and it is alleged to be a fact, and I believe it to be true, that at this time the inventors of the country are compelled to wait a month before they can receive their patents after the application has been filed. [Here the hammer fell.]

The committee divided; and there were—ayes 39, noes 82.

So the amendment was rejected.

Mr. NEWBERRY. I move to insert, after the word "patents," in this clause 24, the words "copyrights and trade-marks;" so that it will read, if adopted:

To patents, copyrights, and trade-marks: to the Committee on Patents.

I think, Mr. Chairman, that this amendment needs no extended remarks from me in support of it. It would seem to commend itself at once to the consideration of everybody that these are cognate subjects and should be referred to the same committee.

Mr. TUCKER. The Supreme Court has decided that trade-marks are unconstitutional.

Mr. NEWBERRY. But there are questions now pending with regard to these very things based upon the decision of the Supreme Court, which, if it is proper, should be referred to a committee, and there can be no more appropriate committee than the Committee on Patents.

Mr. HASKELL. Mr. Chairman, I do not see why we should adopt this amendment. As the gentleman from Virginia [Mr. TUCKER] says, the Government has no power to issue any trade-mark patents or license. The whole question of copyrights belongs exclusively to the Librarian of Congress.

Mr. CLYMER. To the Committee on the Library.

Mr. HASKELL. To the Committee on the Library, and that committee should have charge of the question of copyrights, if any committee is to be placed in charge of the subject. The Committee on Patents have nothing whatever to do with the Library, and there is no such thing as a copyright, while the Supreme Court has ruled out the trade-mark altogether. I do not see any reason why this committee should be encumbered with what does not belong to it, and with matters over which it can exercise no possible control.

Mr. FINLEY. I move to amend the amendment of the gentleman from Michigan by striking out the word "copyright."

The CHAIRMAN. The gentleman from Ohio [Mr. FINLEY] proposes to amend the amendment of the gentleman from Michigan [Mr. NEWBERRY] by striking out the word "copyrights."

Mr. CLYMER rose.

Mr. TOWNSHEND, of Illinois. I object to debate. The committee is dividing.

The CHAIRMAN. Debate is not in order.

The question being taken on Mr. FINLEY's amendment to the amendment, there were ayes 14, noes not counted.

So the amendment to the amendment was not agreed to.

The CHAIRMAN. The question is on the adoption of the amendment of the gentleman from Michigan, [Mr. NEWBERRY.]

Mr. CLYMER. Upon that I can say a word. I move to strike out the last word. I wish the committee not to do a thing which I think they will regret. The whole subject of copyrights is by law committed to the Library.

Mr. HAWLEY. But we have a right to amend the law.

Mr. CLYMER. But not by a rule of this House.

Mr. TOWNSHEND, of Illinois. If a petition were sent in here relating to copyright, would it not be competent to refer it the Committee on Patents?

Mr. CLYMER. It would, if such were the pleasure of the House. But that subject properly belongs to the Library, and is in the hands of the Committee on the Library. Why should it go to the Committee on Patents rather than to any other committee? If any gentleman can show any relation between the two subjects, I would be glad to hear him.

Mr. HAWLEY. These subjects come together in the Constitution, and are evidently in the contemplation of that instrument cognate subjects. We grant certain privileges to inventors and we grant certain privileges to authors. The two subjects go together.

I know that so far as registering a copyright is concerned, that is committed to the Librarian of Congress. You go to the Librarian, pay your fee, deposit two copies of your book, and get a certificate of copyright. But suppose it is thought necessary to have some new legislation concerning copyrights, the subject would have to go to some committee. And what would be more natural than that it should go to the Committee on Patents, a copyright being next door to a patent, one being a patent on a book and the other is a patent on a machine.

As to trade-marks it is quite proper that subject should go there also. The Supreme Court has decided that the trade-mark law is unconstitutional; but there remain on the statute-book some un repealed laws on

the subject, and in the Treasury there are large sums paid by our people on the supposition Congress was giving them some rights; and there may be petitions for a constitutional amendment in favor of trade-marks. Papers may come before us relating to trade-marks, although the law has been declared unconstitutional.

These are evidently cognate subjects. We have a Committee on Patents, and why those other matters should not be put under charge of the same committee I cannot understand.

Mr. NEWBERRY. By referring to the first paragraph of Rule XI it will be seen in what connection this amendment places the whole subject. It says:

All proposed legislation shall be referred to the committees named in the preceding rule as follows, namely: Subjects relating—

And if my amendment be adopted, it will read:

To patents, copyrights, and trade-marks: to the Committee on Patents.

It will not be contended for an instant that there cannot be legislation here, as has been suggested by the gentleman from Connecticut, with regard to trade-marks and also in regard to copyrights, although the Supreme Court may have declared the present law in regard to trade-marks unconstitutional.

The question being taken on Mr. NEWBERRY's amendment, there were—ayes 69, noes 28.

So (further count not being called for) the amendment was adopted.

The Clerk resumed the reading of Rule XI, and read the following:

- 25. To the pensions of the civil war: to the Committee on Invalid Pensions;
- 26. To the pensions of all the wars of the United States other than the civil war: to the Committee on Pensions;
- 27. To private and domestic claims and demands whatsoever, other than war claims against the United States: to the Committee on Claims.

Mr. NEWBERRY. Unless the Committee on the Revision of the Rules have some particular reason for retaining the word "whatsoever" in clause 27, I will move to strike it out. It adds nothing to the force of the paragraph, and it does not follow the phraseology of the other clauses. For instance, take clause 16:

To railways and canals other than Pacific railroads.

The word "whatsoever" is not inserted there. Again in clause 19:

To the public buildings and occupied or improved grounds of the United States.

You do not say "whatsoever." But in clause 27 it is said:

To private and domestic claims and demands whatsoever.

It seems to me the word "whatsoever" is redundant.

Mr. BLACKBURN. I am perfectly willing to have the word struck out provided we can come to a vote.

There being no objection, the word "whatsoever" was struck out.

The CHAIRMAN. The Chair would suggest that instead of "the Committee of Claims" the name of the committee should read "Committee on Claims."

Mr. BLACKBURN. That is a typographical error.

The CHAIRMAN. If there be no objection the correction will be made.

There was no objection.

The Clerk resumed the reading of the bill, and read as follows:

- 28. To claims arising from any war in which the United States has been engaged: to the Committee on War Claims;
- 29. To private claims to lands: to the Committee on Private Land Claims;
- 30. To the District of Columbia: to the Committee for the District of Columbia.

Mr. BLACKBURN. I am directed by the committee to offer the amendment to clause 30 which I send to the desk.

The Clerk read as follows:

After the word "Columbia," in line 1, insert the words "other than appropriations therefor;" and strike out the word "for" and insert "on;" so that it will read:

"To the District of Columbia, other than appropriations therefor: to the Committee on the District of Columbia."

The amendment was agreed to.

The Clerk read as follows:

31. To the revision and codification of the statutes of the United States: to the Committee on the Revision of the Laws;

32. The examination of the accounts and expenditures of the several Departments of the Government and the manner of keeping the same; the economy, justness, and correctness of such expenditures; their conformity with appropriation laws; the proper application of public moneys; the security of the Government against unjust and extravagant demands; retrenchment; the enforcement of the payment of moneys due to the United States; the economy and accountability of public officers; the abolishment of useless offices; the reduction or increase of the pay of officers, shall all be subjects within the jurisdiction of the eight standing committees on the public expenditures in the several departments, as follows:

33. In the Department of State: to the Committee on Expenditures in the State Department;

34. In the Treasury Department: to the Committee on Expenditures in the Treasury Department;

35. In the War Department: to the Committee on Expenditures in the War Department;

36. In the Navy Department: to the Committee on Expenditures in the Navy Department;

37. In the Post-Office Department: to the Committee on Expenditures in the Post-Office Department;

38. In the Interior Department: to the Committee on Expenditures in the Interior Department;

39. In the Department of Justice: to the Committee on Expenditures in the Department of Justice;

40. To public buildings: to the Committee on Expenditures on the Public Buildings;

41. All proposed action touching the rules and joint rules shall be referred to the Committee on Rules;

42. Touching the expenditure of the contingent fund of the House, the auditing and settling all accounts which may be charged therein by order of the House: to the Committee of Accounts;

Mr. WHITE. I move to amend by adding to clause 42, just read, that which I send to the Clerk's desk.

The Clerk read as follows:

And such committee shall make no allowance on contracts or agreements for furnishing material or labor for the House, unless the contract or agreement therefor shall have been previously made and approved by the Clerk of the House.

Mr. WHITE. I offer that amendment merely to make this clause harmonious with the concluding provisions of clause 3 of Rule III, which provides, under the head of "duties of Clerk," that the Clerk shall "make or approve all contracts, bargains, or agreements relative to furnishing any matter or thing, or for the performance of any labor, for the House of Representatives, in pursuance of law or order of the House." He is the ministerial officer of the House in that respect. The present rule of the House upon that subject, Rule 21, adopted January 30, 1846, is as follows:

All contracts, bargains, or agreements, relative to the furnishing any matter or thing, or for the performance of any labor, for the House of Representatives, shall be made with the Clerk, or approved by him, before any allowance shall be made therefor by the Committee of Accounts.

I think it was the intention of the Committee on Rules to retain in this revision that provision of the present rules. It has been inadvertently left out, I think, and I offer this amendment merely to make this clause harmonious with what has heretofore been adopted by the House.

Mr. HASKELL. I desire for one to object to this practice of amending the title of a bill by injecting into that title a mass of legislation. These clauses now under consideration are not descriptive of the powers and duties of committees, and it does not seem to me that this is the place to adopt an amendment directing what a committee shall do. I suggest that there is a proper place in these rules for that direction, and that place is not here. I shall vote against the amendment.

Mr. WHITE. The amendment which I have offered is exceedingly brief and merely preserves the existing rule which requires that all contracts for the furnishing of material, labor, &c., for this House shall be made by the Clerk of the House. My amendment merely indicates that the Committee on Accounts shall first require that that rule be followed before they pass any account. It is merely re-enacting what we have already ordered.

The question was taken upon the amendment of Mr. WHITE; and it was not agreed to upon a division—ayes 15, noes 56.

The Clerk read as follows:

43. The ascertainment of the travel of members of the House shall be made by the Committee on Mileage and reported to the Sergeant-at-Arms.

44. Touching the Library of Congress, statutory, and pictures: to the Joint Committee on the Library;

45. All proposed legislation or order touching printing shall be referred to the Joint Committee on Printing on the part of the House;

46. The enrollment of engrossed bills: to the Joint Committee on Enrolled Bills; and said committee shall have leave to report at any time;

Mr. ROBINSON. I move to amend clause 46, just read, by striking out all after the word "bills," where it occurs the second time; that is, the words "and said committee shall have leave to report at any time."

Mr. FRYE. That is right.

Mr. ROBINSON. These words are not necessary in this clause, because the direction is repeated in the next clause.

Mr. BLACKBURN. I have no objection to that amendment.

The amendment was agreed to.

The Clerk read the following:

47. The following-named committees shall have leave to report at any time on the matters herein stated, namely: The Committee on Elections, on the right of a member to his seat; the Committee on Ways and Means, on bills raising revenue; the Committee on Appropriations, the general appropriation bills; the Committee on Enrolled Bills, enrolled bills; the Committee on Printing, on all matters referred to them of printing for the use of the House or two Houses; and the Committee on Accounts, on all matters of expenditure of the contingent fund of the House.

Mr. CONVERSE. I move to add to clause 47, just read, that which I send to the Clerk's desk.

The Clerk read as follows:

Every report shall be in writing, and shall give the names of the members of the committee who concur in the recommendations thereof.

Mr. CONVERSE. I desire to say but one word in favor of that amendment. It appears to me to be in the interest of economy, and I think the effect will be to require of committees more careful examination of the subjects before them. It brings individual responsibility to bear upon the question of reports, and I hope the amendment will be adopted.

Mr. ROBINSON. It seems to me that the language of the amend-

ment will not quite accomplish what is desired by the gentleman from Ohio, [Mr. CONVERSE.] If he adds that to clause 47 it will apply only to the committees named in that clause. I suppose the gentleman desires to have it apply to all the committees of the House.

Mr. CONVERSE. If it is deemed more advisable, I will move to add it to Rule XI as a separate clause—as clause 48.

Mr. ROBINSON. It should be a separate clause.

Mr. LAPHAM. If it is added to clause 47 it will apply to the Committee on Enrolled Bills named in that clause; and it could hardly be expected that all the members of that committee shall have their names appended to any report made from the committee.

Mr. MILLS. Before any additional clause is added to Rule XI I desire to move an amendment to clause 47, which amendment I send to the Clerk's desk.

The Clerk read as follows:

The Committees on Ways and Means, on Banking and Currency, and on Coinage, Weights, and Measures shall have leave to report at any time, and on motion of any member a majority of the House may fix a day for the consideration of any public bill reported by either of said committees, and the House may continue the consideration of such bill from day to day till disposed of.

Mr. MILLS. The proposition which I now offer is the present rule, word for word. It is the rule which was adopted at the commencement of our recent extra session. This Congress then determined that the Committee of Ways and Means, the Committee on Banking and Currency, and the Committee on Coinage, Weights, and Measures should not only have the privilege of reporting at any time, but also should have the privilege of calling upon the House to fix a day for the consideration of a bill so reported and to continue the consideration of such bill from day to day until disposed of. I do not care to repeat the arguments which I then made, or the argument which I made the other day, why this rule ought to be continued. I think the Committee on Banking and Currency and the Committee on Coinage, Weights, and Measures ought to continue as privileged committees of this House. It is for the House now to decide whether it will recede from the course taken at the commencement of this Congress in reference to this question.

Mr. DUNNELL. Rule XIII proposes that hereafter when committees report the bills reported shall go immediately to one of three calendars. Now, if we adopt Rule XIII we shall be under the necessity of keeping those calendars clear. We do not want a rule that will allow bills to be brought before the House from day to day without regard to those calendars. The adoption of the rule which the gentleman suggests will thoroughly defeat the consideration of measures which may go under Rule XIII to these three calendars.

Mr. FRYE. The reasons which prompted the adoption of the rule authorizing the two committees named by the gentleman from Texas to report at any time will, after these new rules are adopted, cease to exist, because those committees will be called as often as once a week at any rate. Now, the purpose of the Committee on Rules was to get rid of special orders piling themselves one upon another as the session progresses. As to general appropriation bills and measures coming from the Ways and Means Committee; the Committee on Rules have authorized me to offer an amendment, when the proper point is reached, giving the Committee of Ways and Means and the Committee on Appropriations the right to move at any time after the morning hour, not before the morning hour, to go into Committee of the Whole on the state of the Union for the consideration of particular appropriation bills or bills raising revenue. I think that the proposition of the gentleman from Texas is entirely unnecessary, and its adoption would interfere very decidedly with the general scheme and plan of this revision.

Mr. WARNER. Will not the reason which the gentleman from Maine has given in opposition to the amendment of the gentleman from Texas apply as well to the whole of clause 47, which proposes to give special privileges to certain committees?

Mr. FRYE. That is because there may arise exigencies in which it may be absolutely necessary for the committees named to report at any time; for instance, as to a bill for raising revenue. As to the general appropriation bills the gentleman himself has seen the exigency. In reference to the other committees named in clause 47, their duties relate to matters of importance to the House—matters of privilege, matters of printing, matters connected with the contingent fund.

The question being taken on the amendment of Mr. MILLS, it was not agreed to.

Mr. CONVERSE. I now offer the following, to come in as clause 48:

Every report shall be in writing, and shall give the names of the members of the committee who concur in the recommendation thereof.

I desire to state one suggestion in reply to the gentleman from New York, [Mr. LAPHAM.] My opinion is that this rule ought to apply to all committees, including the Committee on Enrolled Bills, because, as I am told, it has sometimes been charged that mistakes have been made in enrolling bills. Hence we ought to know what members of that committee have examined any bill reported and what members concur in the report, so that it may be known where the responsibility rests.

Mr. WHITE. Is it the purpose of this amendment to require that

the members concurring in a report shall sign their names, or simply that their names shall be stated in the report?

Mr. CONVERSE. The object is that the report shall show the names of the members concurring in it.

Mr. WHITE. Why not require them to sign it?

Mr. CONVERSE. I have no objection to that; but it might cause more trouble than the provision I propose.

Mr. HASKELL. Mr. Chairman, I find myself compelled to oppose this amendment for various reasons. No committee of this House probably has a full attendance of all its members in the course of a month. It transacts its business when a quorum is present. A bill may be agreed to by all the members present or by all except one member. But some members are on two committees and must be absent from one. Now, this proposed rule would compel the member in charge of a bill to present his report to the committee, secure their approval, and then go through the Capitol or the city hunting the other members of the committee to ascertain their opinions on the merits of the bill and compelling men who have not listened to the report of the sub-committee and have not had time to examine the merits of the measure to commit themselves to a written report over their signatures for or against the bill.

Now, many a bill passes in my committee perhaps during my absence; a report is made to the committee, and the bill is approved unanimously by those present. Coming upon the floor of this House, I hear a report made from my committee; I notice the bringing forward of a bill in which I am interested, and which the committee has approved in my absence. I have not had time to examine it, but the debate on the floor develops reasons for or against the measure; and I take my position upon it in debate. Now, I do not desire to be obliged to scrutinize every little bill that passes in my committee, and to come to a deliberate conclusion upon it, to be published before this House.

Again, Mr. Chairman, the action of committees is designed to be confidential. You cannot secure the fair consideration of a bill if every man's position upon it is to be bruited abroad, and every lobbyist enabled to train his guns on perhaps a single offending member who disagrees with the majority supporting the bill. Under the operation of this amendment you subject this whole House to a cross-fire of every lobbyist that happens to be in the city.

Let the men who procure the passage of a report through the committee come upon this floor and defend it. Let those who have been compelled to absent themselves from the committee be allowed to listen to the debates on the bill, and to form their conclusions here, without being compelled to make a formal agreement or disagreement.

[Here the hammer fell.]

Mr. WHITE. I move to strike out the last word. I favor this proposition. In my humble opinion it is just what the American Congress requires. If you look over the proceedings of other legislative bodies in the United States, you will find the report has appended to it the signatures of the gentlemen who concur in making it. It gives to these reports the test which we all know has more to do with the legislation of this body than any other feature of our organization, more of the character of deliberation. It gives them somewhat of the judicial character. The judges of every court in the country are recorded as concurring or refusing to concur in the judgment rendered.

The objection of my friend from Kansas [Mr. HASKELL] that it will subject gentlemen who do not seem to concur to a cross-fire of different lobbyists who come here to look after legislation, does not seem to me to be well taken.

Mr. HASKELL. Will the gentleman allow me to ask him a question?

Mr. WHITE. The same objection would be good in favor of every member of the committee.

Mr. HASKELL. Let me ask the gentleman a question.

Mr. WHITE. Certainly.

Mr. HASKELL. I wish to ask the gentleman from Pennsylvania whether during this session of Congress he is prepared now to sign the majority or minority report on every bill which was ordered to be reported by his committee? I ask him whether he is willing to do that now? I wish an answer.

Mr. WHITE. I am willing to answer. I am willing to sign all reports ordered to be made when I was present and in which I concurred.

Mr. HASKELL. But are you ready to sign every report from your committee during this session of Congress?

Mr. WHITE. It is a fair question and I will answer it fairly. I am willing to sign every bill and report passed by the committee when I was present and in which I concurred. As a member of the committee I should be willing to assume the responsibility of every report in which I concurred, and I should be a coward if I refused to do so.

Mr. HASKELL. Are you willing to sign every report made when you did not happen to be there?

Mr. WHITE. Not at all; and this does not contemplate any such thing. It affects only those who concur in the judgment of the committee that their names shall be recited in the report.

Mr. FRYE. I wish to ask the gentleman from Ohio one question. The report made by any committee is supposed to be, of course, the report of the majority, as the minority is only entitled to give its views. I concur in part of his proposition, and I ask him whether he would ac-

cept this as a substitute: "Every bill or resolution reported by any of said committees shall be accompanied by the reasons therefor in writing, which shall be printed?"

Mr. CONVERSE. That does not reach the point of my amendment. If I may be allowed one minute or two more, the object of this bill is that the House shall know what members of a committee concur in the recommendations which that committee makes. What is the object of having committees in the House? It is in order that those committees shall examine the question submitted to them and return to us their opinion and their judgment upon which we ought to and do act. Is it not we shall know whether a majority of the committee concur in the recommendation or not? Any action of the minority of that committee is or should be a report to this House. None but a majority of the entire committee should be allowed to return a report to this House recommending action on its part. This amendment will secure that point, and will disclose the names of the persons on the committee who concur in its recommendation; and all are not bound by the reasoning which may be offered in the report, but only the names of such as concur in the recommendations of the committee. That is all the amendment embraces.

Mr. WHITE, by unanimous consent, withdrew his formal amendment.

The committee divided; and there were—ayes 45, noes 80.

Mr. CONVERSE demanded tellers.

Tellers were ordered.

Mr. CONVERSE and Mr. HASKELL were appointed.

The committee again divided; and the tellers reported—ayes 41, noes 98.

So the amendment was rejected.

Mr. ROBINSON. I move to add the following as an additional clause:

48. No committee shall sit during the sitting of the House without special leave.

Mr. Chairman, I observe that has been omitted. It is the present rule, and it seems to me that it ought to be retained. I do not understand that there is any reason why it should be omitted. Unless some objection is made to it I do not see the necessity for discussing it.

Mr. BLACKBURN. If the gentleman will permit me he will remember that there is already a rule, the first clause of Rule VIII, which requires every member of the House to be in his seat, but if in the judgment of the House this is deemed essential, I shall not object.

Mr. ROBINSON. That is a very indefinite rule. We have had it here since 1794 and it will do no harm, for the proper transaction of the business of the House, to retain it.

Mr. BLACKBURN. I do not care about it.

The amendment was agreed to.

Mr. SHALLENBERGER. I desire to offer a substitute for the entire rule, and I wish to say a word before the Clerk proceeds to read the substitute, as this is a very important rule and as the substitute is lengthy. I desire to say that I have marked only those clauses which have been amended by the committee and proposed to be amended by this substitute. I do not think it necessary that the Clerk should read the clauses word for word where there was no proposition to amend. Hence I have marked just such clauses in this rule as have either been adopted by the deliberate action of the committee or which I propose to amend by this substitute.

Mr. SPRINGER. Without reading the entire substitute I suggest that the gentleman from Pennsylvania be permitted to explain the matter, as we understand it refers to the division of the powers of the committee and it is not necessary to read it at all, as it will take some time to do so.

Mr. MORRISON. Let it be read.

The Clerk read as follows:

RULE XI.

POWERS AND DUTIES OF COMMITTEES.

All proposed legislation shall be referred to the committees named in the preceding rule, as follows, namely: Subjects relating—

1. To the election of members: to the Committee on Elections;
2. To the revenue and the bonded debt of the United States: to the Committee on Ways and Means;
3. To appropriation of the revenue for the support of the Government: to the Committee on Appropriations; and the several appropriation bills, when reported to the House by the committees in which they originate, shall be referred to the Committee on Appropriations to be reported back to the House after due consideration, with such recommendation as the general expenditures of the Government require them to make, and the committee in which the bill originated shall thereupon have charge of it and upon its passage: *Provided*, That each committee in presenting and debating an appropriation bill shall have equal time and equal privileges upon the floor with the Committee on Appropriations;
4. To judicial proceedings, civil and criminal law: to the Committee on the Judiciary;
5. To banking and currency: to the Committee on Banking and Currency;
6. To coinage, weights, and measures: to the Committee on Coinage, Weights, and Measures;
7. To commerce: to the Committee on Commerce; and the Committee on Commerce shall have the same privilege in reporting bills making appropriations for the improvement of rivers and harbors as is accorded to the Committee on Appropriations in reporting general appropriation bills;
8. To agriculture: to the Committee on Agriculture;
9. To the relations of the United States with foreign nations: to the Committee on Foreign Affairs; and this committee shall report the consular and

diplomatic appropriation bill for reference to the Committee on Appropriations;

10. To the military establishment and the public defense: to the Committee on Military Affairs; and this committee shall report the annual appropriation bills for the support of the Army and the Military Academy at West Point, for reference to the Committee on Appropriations;

11. To the naval establishment: to the Committee on Naval Affairs; and this committee shall report the annual appropriation bill for the support of the Navy, for reference to the Committee on Appropriations;

12. To the Post-Office and post-roads: to the Committee on the Post-Office and Post-Roads; and this committee shall report the annual appropriation bills for the service of the Post-Office Department, and for mail transportation by ocean steamers, for reference to the Committee on Appropriations;

13. To the lands of the United States: to the Committee on the Public Lands;

14. To the relations of the United States with the Indians and the Indian tribes: to the Committee on Indian Affairs; and this committee shall report the annual appropriations for expenses of the Indian Department, and for carrying out the treaties and obligations of the Government with the Indian tribes, for reference to the Committee on Appropriations;

15. To territorial legislation, the revision thereof, and affecting Territories or the admission of States: to the Committee on the Territories;

16. To railways and canals other than Pacific railroads: to the Committee on Railways and Canals;

17. To the manufacturing industries: to the Committee on Manufactures

18. To the mining interests: to the Committee on Mines and Mining;

19. To the public buildings and occupied or improved grounds of the United States: to the Committee on Public Buildings and Grounds; and this committee shall report all appropriations therefor, for reference to the Committee on Appropriations;

20. To the railroads and telegraphic lines between the Mississippi River and the Pacific coast: to the Committee on Pacific Railroads;

21. To the levees of the Mississippi River: to the Committee on Levees and Improvements of the Mississippi River;

22. To education and labor: to the Committee on Education and Labor;

23. To the militia of the several States: to the Committee on the Militia;

24. To patents, copyrights, and trade-marks: to the Committee on Patents;

25. To the pensions of the civil war: to the Committee on Invalid Pensions; and this committee shall report the annual appropriation bill for the payment of invalid and other pensions, for reference to the Committee on Appropriations;

26. To the pensions of all the wars of the United States other than the civil war: to the Committee on Pensions;

27. To private and domestic claims and demands, other than war claims, against the United States: to the Committee on Claims;

28. To claims arising from any war in which the United States has been engaged: to the Committee on War Claims;

29. To private claims to lands: to the Committee on Private Land Claims;

30. To the District of Columbia: to the Committee on the District of Columbia; and this committee shall report all appropriations therefor, for reference to the Committee on Appropriations.

31. To the revision and codification of the statutes of the United States: to the Committee on the Revision of the Laws.

32. The examination of the accounts and expenditures of the several Departments of the Government and the manner of keeping the same; the economy, justness, and correctness of such expenditures; their conformity with appropriation laws; the proper application of public moneys; the security of the Government against unjust and extravagant demands; retrenchment; the enforcement of the payment of moneys due to the United States; the economy and accountability of public officers; the abolishment of useless offices; the reduction or increase of the pay of officers, shall all be subjects within the jurisdiction of the eight standing committees on the public expenditures in the several Departments, as follows:

33. In the Department of State: to the Committee on Expenditures in the State Department;

34. In the Treasury Department: to the Committee on Expenditures in the Treasury Department;

35. In the War Department: to the Committee on Expenditures in the War Department;

36. In the Navy Department: to the Committee on Expenditures in the Navy Department;

37. In the Post-Office Department: to the Committee on Expenditures in the Post-Office Department;

38. In the Interior Department: to the Committee on Expenditures in the Interior Department;

39. In the Department of Justice: to the Committee on Expenditures in the Department of Justice;

40. To public buildings: to the Committee on Expenditures on the Public Buildings;

41. All proposed action touching the rules and joint rules shall be referred to the Committee on Rules;

42. Touching the expenditure of the contingent fund of the House, the auditing and settling all accounts which may be charged therein by order of the House: to the Committee on Accounts;

43. The ascertainment of the travel of members of the House shall be made by the Committee on Mileage and reported to the Sergeant-at-Arms;

44. Touching the Library of Congress, statuary, and pictures: to the Joint Committee on the Library;

45. All proposed legislation or order touching printing shall be referred to the Joint Committee on Printing on the part of the House;

46. The enrollment of engrossed bills: to the Joint Committee on Enrolled Bills;

47. The following named committees shall have leave to report at any time on the matters herein stated, namely: The Committee on Elections, on the right of a member to his seat; the Committee on Ways and Means, on bills raising revenue; the Committee on Appropriations, the general appropriation bills; the Committee on Enrolled Bills, enrolled bills; the Committee on Printing, on all matters referred to them of printing for the use of the House or two Houses; and the Committee on Accounts, on all matters of expenditure of the contingent fund of the House.

48. No committee shall sit during the sitting of the House without special leave.

Mr. BLACKBURN. As we have had at least two weeks' debate upon the very proposition involved in this substitute, and looking only to an expedition of the work in the Committee of the Whole, I will move now that the committee rise and go back into the House with the view of agreeing upon a limit that we will put upon the debate. Of course it will not interfere with the right of the gentleman from Pennsylvania.

The committee divided; and there were—ayes 102, noes 3.

So the motion was agreed to.

The committee accordingly rose; and the Speaker having resumed

the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the report of the Committee on Rules, and had come to no resolution thereon.

Mr. BLACKBURN. I move that the House resolve itself into Committee of the Whole on the state of the Union, to continue the consideration of the report of the Committee on Rules; and pending that motion I move that all debate be closed upon the substitute pending for Rule XI, and all amendments thereto, in ten minutes. At the suggestion of several members, I will say twenty minutes.

Mr. FINLEY. Then I will move an amendment, to strike out "twenty" and insert "ten."

Mr. ATKINS. I hope the gentleman from Kentucky [Mr. BLACKBURN] will adhere to his motion as he originally made it, limiting the debate to ten minutes.

Mr. BLACKBURN. Very well. I adhere to my original motion to limit debate to ten minutes.

The motion to limit debate was agreed to.

The motion that the House resolve itself into Committee of the Whole on the state of the Union was agreed to, (Mr. CARLISLE in the chair,) and resumed consideration of the report of the Committee on Rules.

The House accordingly resolved itself into Committee of the Whole on the State of the Union.

The CHAIRMAN. By order of the House all debate on the pending substitute for Rule XI is limited to ten minutes. The Chair will divide that time equally between the friends and opponents of the substitute.

Mr. SHALLENBERGER. My purpose in offering this amendment as a substitute has been, if possible, to save this rule and all the rules from possible rejection as a whole. I fear that if this rule, as now amended, shall stand on a final yea-and-nay vote in the House, there will be danger that these rules shall be rejected entirely, as such a contingency has been more than suggested. I have carefully prepared this substitute so as to embody two or three distinct propositions not heretofore presented to the committee. I call the attention of the committee to clause 3, in which I provide that the time on the floor shall be divided between the committee reporting an appropriation bill and the Committee on Appropriations. I provide further and specifically that each committee reporting a general appropriation bill shall have the control of it on the floor; that it shall have the right to report at any time; that it shall have equal privileges in fact with the Committee on Appropriations, when presenting a general appropriation bill.

I allow the Committee on Public Buildings and Grounds no more right than I allow the Army Committee or Navy Committee and the committees which have in charge the other specific branches of the public service. I except from the operation of this substitute the Committee on Commerce. I allow that committee undivided control of its own bill because the judgment of the Committee of the Whole has settled that beyond a peradventure. We all see they will have it. We might as well accept the fact that the Committee of the Whole and the House by a two-thirds vote will give to that committee the undivided control of its own appropriations in all probability.

My purpose is to give the careful preparation and control of each appropriation bill other than the river and harbor bill to the several committees of this House, and yet to give to the Committee on Appropriations that general review which will give to the Committee of the Whole when it comes to act on these bills an intelligent, comprehensive, and well-matured report, not on the subject-matter originally referred to each committee, not on the distribution of an aggregate appropriation, but on the general expenditures of the Government—the comparison of all the bills and their relative importance as parts of those general expenditures of the Government.

I have formulated in this substitute what I conceive to be the safest and best possible distribution of the responsibilities and powers of this House; I deny with all the force I have the assertion made upon this floor by the distinguished Speaker of the House that the Appropriations Committee does not legislate on these important questions. I point him to the sundry civil bill of last year in which there were \$2,000,000 appropriated for public buildings in this country which had not been previously authorized by law, and by right came under the jurisdiction of our committee. Every dollar of it was in violation of the limitation fixed by law. I ask that my committee shall have jurisdiction originally of a public building and shall limit the appropriations therefor. Why shall it not have jurisdiction of the estimates which extend that limitation hundreds of thousands of dollars? I say that this is the only complete system by and through which we give to each of the committees of this House independent and complete jurisdiction of its own matters, subject, however, to mature comparison and report from an impartial committee specially instructed for that purpose.

Mr. RANDALL, (the Speaker.) This substitute proposes to do in the aggregate what the Committee of the Whole in many particulars has already voted down. It goes further than has yet been suggested in the division of the duty which now belongs to the Appropriations Committee. It takes from the Committee on Appropriations the consular and diplomatic bill, which the Committee on Foreign Affairs has never yet asked for. It takes from the Committee on Appropriations the bill appropriating for the Military Academy at West Point, which has never yet been asked for by the Military Committee, so far as I know.

It takes from the Committee on Appropriations the Army appropriation bill, a proposition which has already been voted down in the Committee of the Whole. It gives to the Committee on Naval Affairs the naval appropriation bill, which that committee has never yet asked for. It takes from the Committee on Appropriations the Post-Office appropriation bill—a proposition which has already been voted down in the Committee of the Whole. It takes from the Committee on Appropriations the Indian appropriation bill—a change which has not yet been asked for by the Indian Committee. It takes from the Committee on Appropriations all control over the appropriations for public buildings—a proposition which I regret has already been agreed to in Committee of the Whole. It omits, however, what the Committee of the Whole has agreed to as to the agricultural appropriations. And it takes from the Committee on Appropriations the appropriations for the District of Columbia, which has never been asked for by the Committee on the District of Columbia. And with all this is coupled the provision in the third clause, as follows:

The several appropriation bills, when reported to the House by the committees in which they originate, shall be referred to the Committee on Appropriations to be reported back to the House after due consideration, with such recommendations as the general expenditures of the Government require them to make; and the committee in which the bill originated shall thereupon have charge of it and upon its passage: *Provided*, That each committee in presenting and debating an appropriation bill shall have equal time and equal privileges upon the floor with the Committee on Appropriations.

Thus the substitute takes the eight bills I mention from the Committee on Appropriations and gives their original preparation to the respective committees I have named, to go to the Committee on Appropriations for amendment and review.

Under the provisions of the third clause of this substitute, when the Committee on Appropriations report back to the House such appropriation bills, with such amendments as said committee deem wise, the control is taken from the Appropriations Committee so reporting them and the bills placed in care of the committees respectively which originated said several bills.

Mr. FRYE. Will the gentleman allow me to interrupt him for one moment; I want to add one other thing which that third clause takes. It takes the floor of the House for at least three months of the session and divides it equally between the Committee on Appropriations and each of the other committees reporting appropriation bills, and leaves all the rest of us, not on those committees, sitting here in our seats as monuments of spared mercy.

Mr. RANDALL, (the Speaker.) In my judgment this is the most objectionable proposition which has yet been introduced, and I believe further that if adopted it must lead not in the direction of retrenchment, but in the direction of increased expenditure. I trust the Committee of the Whole will hesitate before it will undertake to do in this wholesale manner proposed what it has heretofore refused to do when presented in a less objectionable way and in detail.

Mr. HOOKER. I move to amend the proposed substitute by striking out the words "for reference to the Committee on Appropriations" wherever the same occur. I would inquire if any further debate is in order?

The CHAIRMAN. The debate on this substitute and all amendments thereto was limited by order of the House to ten minutes, which time has expired.

The question was taken upon the amendment of Mr. HOOKER, and it was not agreed to; upon a division—ayes 23, noes not counted.

The question recurred on the substitute proposed by Mr. SHALLENBERGER for Rule XI as amended.

Mr. FRYE. That is a very important amendment, and we might as well have the vote taken by tellers at once.

Tellers were ordered, there being 47 in the affirmative, (more than one-fifth of a quorum); and Mr. SHALLENBERGER and Mr. FRYE were appointed.

The committee divided; and the tellers reported that there were—ayes 61, noes 122.

So the substitute was not agreed to.

The Clerk read as follows:

RULE XII.

DELEGATES.

The Speaker shall appoint from among the Delegates one additional member on each of the following committees, namely: Coinage, Weights, and Measures; Agriculture; Military Affairs; Post-Office and Post-Roads; Public Lands; Indian Affairs; Territories, and Mines and Mining; and they shall possess in their respective committees the same powers and privileges as in the House, and may make any motion except to reconsider.

RULE XIII.

CALENDARS.

1. There shall be three calendars of business reported from committees, namely:

First. A calendar of the Committee of the Whole House on the state of the Union, to which shall be referred bills raising revenue, general appropriation bills, and bills of a public character, directly or indirectly appropriating money or property;

Second. A House calendar, to which shall be referred all bills of a public character not raising revenue nor directly or indirectly appropriating money or property; and

Third. A calendar of the Committee of the Whole House, to which shall be referred all bills of a private character.

Mr. DUNNELL. In order that I may ask a question I will move to strike out the third subdivision of clause 1 of Rule XIII.

Mr. BLACKBURN. In order that these matters may come in their regular order, I ask the gentleman from Minnesota [Mr. DUNNELL] to allow me to submit from the Committee on Rules an amendment which should come in before the one which I understand he proposes to offer. It is to clause 2 of Rule XIII, after the word "decided," in line 5, to insert the words "according to its character."

The CHAIRMAN. Clause 2 of Rule XIII has not yet been read.

Mr. BLACKBURN. I supposed that the clause had been read.

Mr. DUNNELL. I have proposed the amendment which I have indicated merely to enable me to ask the gentleman from Kentucky [Mr. BLACKBURN] if there be anything in the new rules relative to the call of committees for private bills. Committees are now called for private bills on Friday. Is that provision retained in the new rules?

Mr. BLACKBURN. I will state to the gentleman that if he will turn to Rule XXVI he will find this:

Friday in each week shall be set apart for the consideration of private business, unless otherwise determined by a majority of the House.

Mr. DUNNELL. But Rule XXIV says "on all days other than Mondays, as soon as the Journal is read and approved, there shall be a morning hour for reports from committees." I was led to infer from that that the Friday rule had been abolished.

Mr. BLACKBURN. Not at all. Upon the contrary, the very matter which the gentleman now refers to was considered by the Committee on Rules, and it was determined that both of these rules taken together could not be considered other than as continuing the present practice of the House which devotes Friday of each week exclusively to the consideration of private business, unless a majority of the House shall otherwise determine.

Mr. DUNNELL. Then am I not correct in this: that the committees are not to be called on Fridays for reports, but that a private bill may be reported any day, Tuesday, Wednesday, or Thursday, when the committee having charge of the subject shall be called for reports?

Mr. BLACKBURN. Certainly; the rule provides that there shall be a morning hour for reports from committees.

Mr. DUNNELL. That is what I desire to know; whether we get rid of the call of committees for private bills on Friday. I understand that we do.

Mr. RANDALL, (the Speaker.) You do not; the rule is not altered at all in that respect. It gives Fridays for the consideration of private business. There will be a morning hour on Friday for reports from committees, and those reports must be of a private nature. On all the other days except Monday there will be a morning hour for committees to make reports of a public character.

Mr. DUNNELL. I fail to see any necessity, then, for a distinction. If on every day of the week except Monday the committees are to be called for reports, and those reports are to go immediately to one of these three calendars without debate, I cannot understand why on Friday any more than on any other day committees should be called exclusively for private bills to go to the Private Calendar. Why not let all bills, whether public or private, come from committees as they are called upon all days of the week and then reserve Friday for the consideration of private business?

Mr. RANDALL, (the Speaker.) The distinction proceeds upon this theory simply: that public business should be promoted in preference to private business.

Mr. DUNNELL. I do not think that under the rule we do that. We call the committees for reports. If I have a private bill from my committee, why may I not report it on Tuesday as well as on Friday? It will take no more time to report it on Tuesday, because it immediately goes to the Calendar.

Mr. RANDALL, (the Speaker.) That might not be objectionable if every committee was first called for private bills. If on any day the hour should not be consumed in reporting and sending instantly to the Calendar bills of a public character, then the committees might be called for private bills, though it should not be Friday. But four days should be given to public measures in preference to private measures, as has been done heretofore. That arrangement the Committee on Rules did not desire to interfere with in the least.

Mr. DUNNELL. Now, Mr. Chairman, perhaps I need not occupy the time of the committee longer; but if we were to adopt Rule XXIV, providing that all reports on being presented shall go immediately to the Calendar, I can see no reason why we should set apart Friday for receiving reports of a private nature. If committees are to be called for reports on every day of the week except Monday, according to Rule XXIV, then I cannot see what ruling could be made which would deny to a committee the right to report private bills whenever the committee may be called. I find nothing in this revision that says I may not as a member of a committee report a private bill on Tuesday, Wednesday, or Thursday.

Mr. BLACKBURN. There is nothing there that will prevent the gentlemen from doing so.

Mr. DUNNELL. But now if I report a private bill on Wednesday, for instance, it is ruled out.

Mr. BLACKBURN. I do not so understand.

Mr. DUNNELL. Oh, yes.

Mr. FRYE. It is ruled out if the point is made.

Mr. DUNNELL. I understand that a private bill reported on any other day than Friday is at present ruled out if the point is made.

Mr. BLACKBURN. The gentleman from Minnesota, I am sure, does not want to be mistaken.

Mr. DUNNELL. No, sir.

Mr. BLACKBURN. But the gentleman is mistaken in this: under the present rules and practice of the House there is nothing to prevent any gentleman from reporting a private bill on Tuesday, Wednesday, or Thursday.

Mr. DUNNELL. Let me ask the gentleman whether the ruling of the Chair has not been invariably in the direction of excluding private reports on those days.

Mr. BLACKBURN. No, sir. The Speaker will answer for himself; but I take it that the ruling of the Chair has never gone farther in that direction than to give preference to public bills as against private bills; and this, I take it, will be the object of the House.

Mr. RANDALL, (the Speaker.) And on a Friday to give preference to private bills as against public bills.

Mr. FRYE. Let me call the attention of the gentleman from Minnesota to a single point. Hitherto under our rules every bill reported during the morning hour could be considered at once upon the report being made, unless it contained an appropriation of money. Now, it has been held, and properly held, that on days devoted to public business a report of a private nature could not be received and considered. But under these revised rules there is nothing to prevent a member from reporting a private bill on a public-bill day, there being then no consideration of it other than to send it at once to a calendar.

Mr. DUNNELL. There is a difference of opinion, then, among members of the Committee on Rules upon this point. The gentleman from Pennsylvania [Mr. RANDALL] and the gentleman from Kentucky [Mr. BLACKBURN] disagree, as I understand, with the gentleman from Maine, [Mr. FRYE.]

Mr. RANDALL, (the Speaker.) Under the existing rules a public bill cannot be reported on a Friday without the consent of the House. But on other days, during the morning hour, private bills as well as public bills are constantly reported from committees.

Mr. DUNNELL. If we adopt the threefold calendar as proposed in this revision and along with that adopt Rule XXIV, I insist that there should be no distinction made as to the character of bills to be reported by committees on different days of the week; for, as I understand, they are not to be considered at once, but are simply to be received and sent to the Calendar without debate.

Mr. BUCKNER. Mr. Chairman, I rise to a question of order. What is the question before the committee?

The CHAIRMAN. It is the motion of the gentleman from Minnesota [Mr. DUNNELL] to strike out the third subdivision of clause 1, Rule XIII.

Mr. DUNNELL. I withdraw that amendment.

Mr. CALKINS. I move at the end of the third clause to add the following.

The Clerk read as follows:

4. A calendar for pension cases and claims reported from the Committee on Pensions.

Mr. CALKINS. My purpose in offering this amendment is to disconnect this class of cases and claims from all other cases and claims reported from other committees, that they may be placed together upon the same calendar where we may see the exact position of each. And it is for another purpose: it is to take them out of the way of the public Calendar, which is often choked up by other business when pension cases could be reached and passed in a moment without loss of time to the House. In other words, it is to make a calendar of pension cases alone, so these cases may be considered unobstructed and speedily by the House. And inasmuch as the whole country has pledged these sufferers its support under all circumstances nothing can conduce to the consideration of these claims so much as a calendar upon which they shall stand alone. I ask in justice to this class of claimants they shall be put upon a calendar by themselves.

The committee divided; and there were—ayes 37, noes 85.

Mr. CALKINS. I do not like to take up the time of the House, but I want tellers on this question.

The CHAIRMAN. No quorum having voted the Chair will order tellers; and he appoints Mr. CALKINS and Mr. BLACKBURN.

The committee again divided; and the tellers reported—ayes 32, noes 86.

So the amendment was rejected.

Mr. MYERS. I move the committee rise.

The committee divided; and there were—ayes 59, noes 73.

So the committee refused to rise.

Mr. BAKER. I move to add the following:

4. A calendar for pension claims to which shall be referred all bills relating to pensions, which shall have priority in consideration over all other bills of a private nature.

I desire to say a word on that amendment, and I trust what I shall

have to say will be conclusive. It seems to me as though one of the most becoming things which can be done in this House by the representatives of the people would be to give priority in consideration to pension claims over all other private claims. There is no party in this country which is not pledged to the soldier, no party that has not affirmed that the claim which was due to the soldier who was wounded and bled in the Army and the widows and orphans of those killed—I say there is no party which has not proclaimed that class of claims should be preferred to all others which could be presented to the Government.

Now and here this House has an opportunity, so far as members of both parties are concerned, to give slight evidence by the action they take on this proposition of their belief and sincerity in the annual proclamations made in their party platform.

Mr. FRYE. I simply desire to call the attention of the House to this. If any amendment of this kind is to be passed, it would be proper when we reach page 40, third paragraph, clause 6, which is as follows:

Third. On Friday of each week, after the morning hour, it shall be in order to entertain a motion that the House resolve itself into the Committee of the Whole House to consider business on the Private Calendar; and, if this motion fail, then public business shall be in order as on other days.

It is not proper here.

Mr. BAKER. Will the gentleman let me ask him a question? [Cries of "Vote!"]

Mr. BLACKBURN. I make the point of order the debate is exhausted.

The committee divided; and there were—ayes 43, noes 99.

So the amendment was disagreed to.

The Clerk read as follows:

2. The question of reference of any proposition, other than that reported from a committee, shall be decided without debate, in the following order, namely: a standing committee, a select committee; but the reference of a proposition reported by a committee, when demanded, shall be decided without debate, in the following order, namely: House Calendar, Committee of the Whole House on the state of the Union, Committee of the Whole House, a standing committee, a select committee.

Mr. BLACKBURN. I am instructed by the Committee on Rules to move the following amendment: After the word "decided" in line 5, clause 2, Rule XIII, insert "according to its character."

The amendment was agreed to.

The Clerk read as follows:

RULE XIV.

OF DECORUM AND DEBATE.

1. When any member desires to speak or deliver any matter to the House, he shall rise and respectfully address himself to "Mr. Speaker," and on being recognized may address the House from any place on the floor or from the Clerk's desk, and shall confine himself to the question under debate, avoiding personality.

2. When two or more members rise at once, the Speaker shall name the member who is first to speak, and no member shall occupy more than one hour in debate on any question in the House or in committee, except as further provided in this rule.

3. The member reporting the measure under consideration from a committee may open and close, where general debate has been had thereon, and if it shall extend beyond one day, he shall be entitled to one hour to close, notwithstanding he may have used an hour in opening.

4. If any member, in speaking or otherwise, transgress the rules of the House, the Speaker shall, or any member may, call him to order; in which case he shall immediately sit down, unless permitted, on motion of another member, to explain, and the House shall, if appealed to, decide on the case without debate; if the decision is in favor of the member called to order, he shall be at liberty to proceed, but not otherwise; and, if the case require it, he shall be liable to censure or such punishment as the House may deem proper.

5. If a member is called to order for words spoken in debate, the member calling him to order shall indicate the words excepted to, and they shall be taken down in writing at the Clerk's desk, and read aloud to the House; but he shall not be held to answer, nor be subject to the censure of the House therefor, if further debate or other business has intervened.

6. No member shall speak more than once to the same question without leave of the House, unless he be the mover, proposer, or introducer of the matter pending, in which case he shall be permitted to speak in reply, but not until every member choosing to speak shall have spoken.

7. While the Speaker is putting a question or addressing the House no member shall walk out of or across the hall, nor, when a member is speaking, pass between him and the Chair; and during the session of the House no member shall wear his hat, or remain by the Clerk's desk during the call of the roll or the counting of ballots, or smoke upon the floor of the House; and the Sergeant-at-Arms is charged with the strict enforcement of this rule.

Mr. HAWLEY. I call the attention of the gentleman from Kentucky to the last line, "and the Sergeant-at-Arms is charged with the strict enforcement of this rule." He means this clause. By this new subdivision into rules and clauses, the word "rule" should be changed to "clause."

Mr. BLACKBURN. Yes, it is clause 7 which was intended to be referred to, and I will move to strike out the word "rule" and in lieu thereof to insert the word "clause."

The amendment was agreed to.

The Clerk read as follows:

RULE XV.

ON CALLS OF THE ROLL AND HOUSE.

1. Upon every roll-call, the names of the members shall be called alphabetically by surname, except when two or more have the same surname, then the whole name shall be called; and after the roll has been once called, the Clerk shall call in their alphabetical order the names of those not voting; and there-

after the Speaker shall not entertain a request to record a vote or announce a pair.

2. In the absence of a quorum, fifteen members, including the Speaker, if there is one, shall be authorized to compel the attendance of absent members, and in all calls of the House the names of the members shall be called by the Clerk, and the absentees noted; the doors shall then be closed, and those for whom no sufficient excuse is made may, by order of a majority of those present, be sent for and arrested, wherever they may be found, by officers to be appointed by the Sergeant-at-Arms for that purpose, and their attendance secured; and the House shall determine upon what condition they shall be discharged.

RULE XVI.

ON MOTIONS, THEIR PRECEDENCE, ETC.

1. Every motion made to the House shall be reduced to writing on the demand of any member, and shall be entered on the Journal with the name of the member making it, unless it is withdrawn the same day.

Mr. BLACKBURN. By the direction of the Committee on Rules I offer the following amendment to the first clause:

After the word "House," insert the words "and entertained by the Speaker."

The amendment was agreed to.

The Clerk read as follows:

2. When a motion has been made, the Speaker shall state it, or (if it be in writing) cause it to be read aloud by the Clerk before being debated, and it shall then be in possession of the House, but may be withdrawn at any time before a decision or amendment.

3. When any motion or proposition is made, the question, Will the House now consider it? shall not be put unless demanded by a member.

4. When a question is under debate, no motion shall be received but to fix the day to which the House shall adjourn, to adjourn, to take a recess, to lie on the table, for the previous question, (which motions shall be decided without debate,) to postpone to a day certain, to refer or amend, or to postpone indefinitely, which several motions shall have precedence in the foregoing order; and no motion to postpone to a day certain, to refer, or to postpone indefinitely, being decided, shall be again allowed on the same day at the same stage of the question.

Mr. HAWLEY. I move to strike out in line 3 of clause 4 the word "lie," and in lieu thereof to insert "lay," so that it will read "to lay on the table." It is a grammatical error which has been in the rules for generations and has been allowed to remain in the revision. When a thing is "laid" on the table it lies there. The verbs that precede this one in the sentence are active verbs—"to adjourn," "to take a recess"—and they should be followed by the active verb "to lay on the table." Here we have it "to lie on the table" following "to adjourn," "to take," &c. It should be "lay" instead of "lie."

Mr. BLACKBURN. I do not care at all about this, but I wish to say to the gentleman I do not concur with him in his conclusion. There is not a rule which incorporates that word which has been in existence for a hundred years, which is not equally amenable to the same criticism.

Mr. HAWLEY. I have looked at the matter carefully, and you cannot find a book in the Library of Congress which will justify the gentleman in the use of the word "lie" as it is reported.

The amendment was agreed to.

The Clerk read as follows:

5. A motion to fix the day to which the House shall adjourn, a motion to adjourn, and to take a recess shall always be in order, and the hour at which the House adjourns shall be entered on the Journal.

6. On the demand of any member, before the question is put, a question shall be divided if it include propositions so distinct in substance that one being taken away a substantive proposition shall remain.

7. A motion to strike out and insert is indivisible, but a motion to strike out being lost shall neither preclude amendment nor motion to strike out and insert; and no motion or proposition on a subject different from that under consideration shall be admitted under color of amendment.

8. Pending a motion to suspend the rules, the Speaker may entertain one motion that the House adjourn; but after the result thereon is announced he shall not entertain any other dilatory motion till the vote is taken on suspension.

Mr. FRYE. I am instructed by the committee to offer the following amendment, to be known as clause 9 of this rule:

At any time after the expiration of the morning hour it shall be in order to move that the House resolve itself into the Committee of the Whole House on the state of the Union for the purpose of considering bills raising revenue or general appropriation bills.

This is made necessary, Mr. Chairman, by the rule here which provides first for the reading of the Journal, then for the morning hour, then the unfinished business is to be proceeded with, then the motion to go to business on the Speaker's table, and finally the motion to go into Committee of the Whole. Now, it may become necessary on certain occasions, at the expiration of the morning hour, that a motion should be made to proceed at once with the consideration of an appropriation bill, or a bill raising revenue, and that is provided for in the amendment which, as I have stated before, I am instructed by the committee to offer.

The amendment was agreed to.

The Clerk read as follows:

RULE XVII.

PREVIOUS QUESTION.

1. There shall be a motion for the previous question, which, being ordered by a majority of members present, if a quorum, shall have the effect to cut off all debate and bring the House to a direct vote upon the immediate question or questions on which it has been asked and ordered. The previous question may be asked and ordered upon a single motion, a series of motions allowable under the rules, or an amendment or amendments, or may be made to embrace all authorized motions or amendments and include the bill to its engrossment and

third reading, and then, on renewal of said motion, to its passage or rejection. It shall be in order, pending the motion for or after the previous question shall have been ordered on the final passage, for the Speaker to entertain and submit a motion to commit, with or without instructions, to a standing or special committee; and a motion to lie upon the table shall be in order on the second and third reading of a bill.

Mr. BLACKBURN. I am directed by the Committee on Rules to offer an amendment to that clause of Rule XVII. It is to insert after the word "renewal," in the ninth line, the words "and second."

The amendment was agreed to.

Mr. BLACKBURN. I am also directed to offer the following amendment: in line 13 of this clause, to strike out the word "special" and insert in lieu thereof the word "select."

The amendment was agreed to.

Mr. BLACKBURN. I wish also to make a verbal amendment by striking out the two words in line 11 "the final," and to insert instead thereof the word "its;" so it will read "on its passage" instead of "final passage."

The amendment was agreed to.

Mr. HASKELL. I desire to ask the gentleman from Kentucky [Mr. BLACKBURN] a question; but if it lead to debate at all I will give up the floor for a motion that the committee rise. Under this rule as reported by the Committee on Rules the previous question upon the engrossment and third reading of a bill only has its effect and remains in force down to the third reading of a bill.

Mr. BLACKBURN. That has always been so.

Mr. HASKELL. I know that has always been so. Now, a man comes upon the floor, reports his bill, moves the previous question, and brings the House to a vote. I desire to ask the gentleman from Kentucky, and through him the Committee on Rules, whether in their opinion they would not deem it wise to have the previous question once moved upon the engrossment and third reading go clear through to the passage, so that this loop-hole for entrapping the unwary shall not be left?

Mr. BLACKBURN. I do not; for the reason that after you have moved the previous question on a bill and any amendments pending, and that previous question shall have been in operation, and carried the bill to its engrossment and third reading, it may, and very often does, occur that the House finds there is some amendment, some discussion, some consideration which even the voting upon the bill under the operation of the previous question has demonstrated to be necessary, but there is no way of getting that amendment or that discussion unless you go back and reconsider the several stages through which the bill has gone, which would be very cumbersome. When the previous question on engrossment and third reading is exhausted, the Chair always recognizes the gentleman in charge of the measure to renew the demand for the previous question on the passage, and if then the House has not discovered any hasty legislation or any mistake that has been made, the previous question is again ordered, and carries the bill through to its passage.

Mr. HASKELL. I desire to ask another question.

Mr. BLACKBURN. If it be in the nature of debate I stand committed to move that the committee rise.

Mr. HASKELL. Then I desire to retain the floor to offer an amendment.

Mr. BLACKBURN. You shall have it. I move that the committee rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the report of the Committee on Rules, and had come to no resolution thereon.

* * * * *

FEBRUARY 12, 1880.

* * * * *

REVISION OF THE RULES.

Mr. BLACKBURN. I now insist upon my motion to go into Committee of the Whole upon the report of the Committee on Rules.

The motion was agreed to.

The House accordingly resolved itself into Committee of the Whole, Mr. CARLISLE in the chair.

The pending provision of the rules was as follows:

RULE XVII.

PREVIOUS QUESTION.

1. There shall be a motion for the previous question, which, being ordered by a majority of members present, if a quorum, shall have the effect to cut off all debate and bring the House to a direct vote upon the immediate question or questions on which it has been asked and ordered. The previous question may be asked and ordered upon a single motion, a series of motions allowable under the rules, or an amendment or amendments, or may be made to embrace all authorized motions or amendments and include the bill to its engrossment and third reading, and then, on renewal of said motion, to its passage or rejection. It shall be in order, pending the motion for or after the previous question shall have been ordered on the

final passage, for the Speaker to entertain and submit a motion to commit, with or without instructions, to a standing or special committee; and a motion to lie upon the table shall be in order on the second and third reading of a bill.

Mr. HAWLEY. I wish to suggest merely a verbal correction in accordance with one which we have already made in a previous rule. It is in the last sentence of clause 1 of Rule XVII, to strike out the word "lie" and insert the word "lay;" so that it will read: "a motion to lay upon the table," &c.

Mr. BLACKBURN. I do not believe the amendment is proper or defensible in grammar. But I will say again to the gentleman from Connecticut [Mr. HAWLEY] that so long as he confines himself to such small amendments I have no objection; let him go on.

Mr. HAWLEY. I beg leave to say that I have allowed to pass unnoticed many expressions in the gentleman's report that are objectionable grammatically. I do not make this amendment in a captious spirit at all. If the gentleman had been an editor and a proof-reader as long as I have he would have got over any tenderness of feeling in regard to such correction. Twenty years ago I had a hide as thick as that of a rhinoceros on that subject. I could write as carefully as I pleased and put what I wrote into the hands of the best compositors, and the next day I would find errors in it.

I will call the gentleman's attention to this illustration: some years ago the University of Glasgow undertook to print an edition of some Greek classic, and day after day a page of the work was publicly posted on the university grounds, with a reward offered for the discovery of an error therein. After the edition had been published, and many pounds paid by way of rewards for errors, it was found that there was a gross error on the title-page.

I make these corrections in no spirit of captiousness, I repeat, but only in order that we may have as little bad English in the rules as possible—that we may avoid what has occurred heretofore, the reference to this identical error as one of the ridiculous vulgarisms in language that have occasionally crept into high places.

Mr. BLACKBURN. I am trying not to avoid the gentleman's amendments, for they are too small to be objectionable, but to avoid his speeches. I do not think he is correct as a matter of grammar. Such authorities as Cushing and others on parliamentary law for a hundred years past are at a variance with him. But I am not disposed to cavil about or to stickle upon such things. I am not a proof-reader, and the gentleman may be correct in this little matter.

The amendment of Mr. HAWLEY was then agreed to.

The Clerk resumed the reading, and read as follows:

2. A call of the House shall not be in order after the previous question is ordered, unless it shall appear upon an actual count by the Speaker that a quorum is not present.

3. All incidental questions of order arising after a motion is made for the previous question, and pending such motion, shall be decided, whether on appeal or otherwise, without debate.

RULE XVIII.

RECONSIDERATION.

When a motion has been made and carried or lost, it shall be in order for any member of the majority, on the same or succeeding day, to move for the reconsideration thereof, and such motion shall take precedence of all other questions except the consideration of a conference report, a motion to fix the day to which the House shall adjourn, or to take a recess, and shall not be withdrawn after the said succeeding day without the consent of the House, and thereafter any member may call it up for consideration: *Provided*, That such motion, if made during the last six days of a session, shall be disposed of when made.

2. No bill, petition, memorial, or resolution referred to a committee, or reported therefrom for printing and recommitment, shall be brought back into the House on a motion to reconsider; and all bills, petitions, memorials, or resolutions reported from a committee shall be accompanied by reports in writing, which shall be printed.

RULE XIX.

OF AMENDMENTS.

When a motion or proposition is under consideration, a motion to amend and a motion to amend that amendment shall be in order, and it shall also be in order to offer a further amendment by way of substitute, to which one amendment may be offered, but which shall not be voted on until the original matter is perfected, but either may be withdrawn before amendment or decision is had thereon.

RULE XX.

OF AMENDMENTS OF THE SENATE.

Any amendment of the Senate to any House bill shall be subject to the point of order that it shall first be considered in the Committee of the Whole House on the state of the Union if, originating in the House, it would be subject to that point.

RULE XXI.

ON BILLS.

1. Bills and joint resolutions introduced for reference and those reported by committees without such introduction shall be read a first time by their titles and printed, the second time in full, the third time by their titles, unless the reading in full shall be demanded by a member.

Mr. BLACKBURN. I offer the following as a substitute for the first clause of Rule XXI:

Every bill and joint resolution shall receive three readings before its passage, which shall be as follows: The first reading by title on its introduction for reference, or being an original bill on its report from a committee for commitment, or by unanimous consent for present action; the second reading in full; and the third reading by its title, unless the reading in full shall be demanded by a member.

Mr. FRYE. Does the gentleman offer this amendment by authority of the Committee on Rules?

Mr. BLACKBURN. The committee agreed to this, except possibly

as to one point, upon which there was probably some dissent on the part of one member of the committee; that was in reference to the second reading of a bill being in full. I do not understand that there is any objection upon the part of any member of the committee to this amendment; and, if not, then it is offered by the authority and direction of the committee.

Mr. CANNON, of Illinois. I suppose the second reading in full under the proposed amendment can be dispensed with by unanimous consent.

Mr. BLACKBURN. Yes, sir.

Mr. CANNON, of Illinois. The amendment speaks of dispensing with the third reading by unanimous consent, but it does not speak of dispensing with the second reading by unanimous consent. This is the reason I made the inquiry.

Mr. BLACKBURN. I will say to the gentleman from Illinois that it is not the purpose of this rule to restrict the right of any member to demand the reading of any bill in full upon its passage after it shall have been engrossed. This simply waives the necessity of a demand for the full reading of the bill prior to its engrossment; and after its engrossment it will be in the power of any member to call for the reading of the bill in full.

The amendment was agreed to.

The Clerk read as follows:

2. Bills and joint resolutions on their passage shall be read the first time by title and the second time in full, when, if the previous question is ordered, the Speaker shall state the question to be: Shall the bill be engrossed and read a third time? and, if decided in the affirmative, it shall be read the third time by title, unless the reading in full is demanded by a member, and the question shall then be put upon its passage.

Mr. WHITE. I move to amend by inserting after the clause just read the following, to come in as clause 3:

The general appropriation bills shall embrace nothing but appropriations for the ordinary expenses of the different departments of the Government and interest on the public debt. All other appropriations shall be made by bills containing only items of appropriation relating to the subject-matter of the bill.

Mr. Chairman, this is substantially the amendment which I offered during the consideration of the eleventh rule, when we had reached the clause defining the duties of the Appropriations Committee. At the suggestion of my colleague, the Speaker of the House, I withdrew it then to offer it at this time. This is the proper place, I apprehend, to offer it.

Mr. BLACKBURN. Does the gentleman from Pennsylvania offer this as a substitute for the third clause?

Mr. WHITE. No, sir; I offer this as an independent clause to come in ahead of the present third clause. If this amendment should prevail, it will be prudent to amend the present third clause by striking from it that portion which provides—

Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures.

Now, Mr. Chairman, this proposition clearly and distinctly raises before the House the issue, is it proper to put general legislation on appropriation bills? If this amendment prevails it will be hereafter impossible, certainly irregular, for the Committee on Appropriations to report in an appropriation bill any proposition for a change of existing laws. It will also be out of order for any amendment changing existing law to be received upon the consideration of an appropriation bill. In a word, it clearly and distinctly confines the Appropriations Committee and the appropriation bills of this House to the appropriation of public money to carry on the different departments of the Government. If this is made the rule it will be impossible to have a recurrence of such debates as we had during the extra session of the present Congress. I think the amendment meets the necessities of the hour. Its wisdom should commend it to the approval of all fair-minded men in this body.

There are no politics whatever in the amendment. Both parties in the past history of the Government have offended (if it is an offense) by proposing changes of existing law upon appropriation bills. All parties which have had at different times control of legislation have been alternately criticised for the practice of adding riders to appropriation bills. If this rule be now adopted it will be a new departure in a direction which I think the sentiment of the country demands. I call the attention of members from the different States to the fact that this amendment embodies, briefly and tersely expressed, provisions to be found in the recently adopted constitutions of many of the States. I think it is very similar to a provision in the new constitution of Illinois. It certainly is almost *in totidem verbis* the provision regulating appropriations as contained in the new constitution of Pennsylvania. This constitution met the approval of the popular will by a majority of some one hundred and fifty thousand votes. No feature of this constitution commended itself more to the people of our great State than this change of the manner of passing general appropriation bills. It is not necessary for me to argue what every gentleman is familiar with. This proposition clearly defines the issue between those who favor making appropriation bills the wager of battle for general and partisan legislation and those who oppose it. Let us see how it will end.

[Here the hammer fell.]

Mr. CONGER. Mr. Chairman, I rise to oppose this amendment. I oppose its insertion in the place where it is proposed to be inserted. When we reach the next paragraph I should be in favor of some provision of this kind. As I said on a former occasion, I desired when we should reach this subject to make some remarks in regard to the clause permitting legislation on appropriation bills. The whole history of Congress shows that no such power was ever claimed when a party had control of the three departments of the Government—the House, the Senate, and executive—never.

My friend from Pennsylvania [Mr. WHITE] has referred to the provisions of many of the State constitutions. I wish to show how utterly inconsistent, under the leadership of our Speaker, (who is present, I believe,) have been the votes of all my southern friends in the adoption and enforcement of the provision now contained in our rules. Those who regard as of binding force the example of southern gentlemen in framing the constitution of the confederacy will bear in mind that that constitution contained a clause preventing legislation on appropriation bills. Those who adopted that constitution were uninfluenced by any desire to override any party or any people, uninfluenced by any desire to have an opportunity to slip in any legislation against the will of a portion of the House or against the will of the Senate or against the will of the President. I only refer to this because of the rebuke it carries with it to gentlemen who uphold the proposition now contained in our rules. The clause in the constitution of the confederacy to which I have referred was adopted as the solemn sentiment of gentlemen who now represent the South, and whom I from time to time in my innocent manner charge with carrying out so effectually the views of southern men in old times even up to the present.

Mr. ATKINS. There is one good thing, then, in the South.

Mr. CONGER. It is in direct opposition to the vote of every man in the South as to its expediency, as to its propriety, for when reporting their own constitution they adopted a provision prohibiting legislation on appropriation bills.

Mr. ATKINS. Circumstances alter cases.

Mr. CONGER. I say circumstances alter cases. This proposition never was made until it became necessary for the Speaker of this House to ask his southern friends from the late confederacy to change their entire views which they had embodied in a constitutional provision, change their entire course of action, and sustain him in a change of the rules, a change from that which had been the rule of this House, compelling his associates from the Confederate States service to violate their judgment as embodied in their own constitution—

Mr. RANDALL, (the Speaker.) Will the gentleman allow me a moment?

Mr. CONGER. After my five minutes are up. [Laughter.] I look upon that action of the Speaker of this House when he placed himself at the head of the whole confederate army in this House and compelled them to ignore the action of their wisest and best and follow in his lead—I say I look upon that as one of the greatest triumphs that a northern man ever gained over the confederate brigadier-generals of this House. [Laughter.] No member of this side of this House, sir, ever could have begun to influence these friends of the South so suddenly, so unitedly, so earnestly as to cast reproach, disgrace, and shame upon those of their friends, if not themselves, who had incorporated into the solemn instrument of organization of the southern confederacy a clause which prevented legislation even for the reduction of expenses upon their appropriation bills.

The CHAIRMAN. The gentleman's time has expired.

Mr. CONGER. Is my time quite up? [Laughter.]

The CHAIRMAN. It is.

Mr. CONGER. I have a word or two to say about the Speaker, but he knows my estimate of his power. [Laughter.]

Mr. RANDALL, (the Speaker.) The gentleman from Michigan is generally accurate, and I wonder he is not so in reference to what he has just stated. I am not perhaps as familiar with the confederate constitution as he is; but, if I recollect aright, the constitution of the Confederate States contains no such clause as that which he alleges.

Mr. CONGER. I think it does.

Mr. RANDALL, (the Speaker.) I think not. The clause, as I recollect, in that constitution, gave to the president of the confederacy the right to veto any part of an appropriation bill.

A MEMBER. Any item.

Mr. RANDALL, (the Speaker.) Any item of an appropriation bill; but it did not restrict the confederate congress in any respect as to what legislation should be placed upon appropriation bills. So that "noble army" he speaks of from the South as having battled for economy—and I join him in every commendation of their conduct—was not inconsistent when they assumed the position upon this floor in favor of legislation upon appropriation bills in favor of retrenchment and reform. [Applause.]

Mr. CONGER. And if it should appear that was in the confederate constitution as I have stated it—I have it not here and I cannot refer to it—then the gentleman will agree he had the power to lead the whole army of southern men against their will.

Mr. RANDALL, (the Speaker.) I do not want to lead a better army than the army in the Forty-fourth Congress, first session, without

regard to where they came from, which fought in defense of economy and reform. [Applause.]

Mr. CONGER. We all know that; we all know the pride with which the Speaker leads that army against the North and against the people.

Mr. RANDALL, (the Speaker.) Mr. Chairman, I have no answer to make to that remark.

Mr. GOODE. I move to strike out the last word.

The CHAIRMAN. Inasmuch as this is a very important matter, unless some gentleman insists on it the Chair will not require these formal amendments to be made, and will endeavor to recognize gentlemen alternately—first, those for, and then those against—until such time as the committee sees proper to ask that the rules shall be strictly enforced.

Mr. GOODE. Mr. Chairman, we are not here now to make a constitution. Whatever may be in the constitution of the late Confederate States, I wish to call the attention of the gentleman from Michigan who has just spoken to the fact that the Constitution of the United States, under which we now live, provides that each House may determine the rules of its own proceeding for itself. And if the House of Representatives, in the adoption of its rules, shall determine that it is judicious and proper to ingraft general legislation upon an appropriation bill, then neither the Senate nor the President nor anybody else has the right to make any complaint or objection. It is a matter, sir, within the discretion of the House of Representatives, in which is vested the sole and exclusive power to originate money bills.

Now, Mr. Chairman, while I concede as a general proposition that it may be an unscientific method of legislation, yet I maintain that occasions may arise when the public liberties may be so seriously imperiled that the House of Representatives ought not to surrender this power and ought not to consent under any circumstances not to resort to its exercise. If bad and vicious legislation is fastened upon the statute-book which we are unable to repeal on account of the executive veto, then it is not only the right but in my judgment it is the duty of the House to stand and withhold the appropriations of money until—

Mr. ROBESON. Let me interrupt the gentleman for a mere question.

Mr. GOODE. We ought to withhold the money until we can obtain a redress of the grievances complained of.

Mr. ROBESON. I merely wish to ask the gentleman a single question in this connection.

Mr. GOODE. I have not time to yield to the gentleman.

Mr. ROBESON. I merely wish to ask the gentleman whether the House of Representatives have the right under any circumstances under the Constitution to usurp the rights of the Senate or of the Executive?

Mr. GOODE. No, sir; but under the Constitution the House may determine the rules of its own proceeding.

Mr. Chairman, there is no better teacher than experience. There is no safer criterion to judge of the future than by the past. And I ask any gentleman on this floor if we could ever have succeeded in incorporating the legislation which was incorporated in the appropriation bill during the first session of this Congress, to wit, that no money appropriated should be used for the subsistence, equipment, transportation, or compensation of any portion of the Army of the United States to be used as a police force at the polls, if it had not been for the provisions of Rule 120? And does any man believe that we should have succeeded in forcing a repeal of those relics of war legislation—sections 801, 820, and 821 of the Revised Statutes, which practically excluded from the jury-box nearly all of the white people in eleven States of this Union—if it had not been for this same Rule 120? In my judgment, sir, that much-abused rule has not only been the means of enabling this Congress to save \$30,000,000 of the people's money per annum in the expenditures of the Government, but it has been the bulwark behind which we have been able to keep the Army from the polls and to break down the barriers which excluded fair and impartial jurors from the jury-box. This is my judgment in regard to this rule, and I am not willing as a member of this House to have it repealed. It has enabled us to accomplish great and salutary measures of reform which entitle this House to the gratitude of the country; but we must not stop in the good work until we have secured the repeal of certain sections of the Revised Statutes which permit the presence of Federal marshals at the polls with power to interfere in the conduct of elections and arrest American citizens on suspicion with or without process of law.

[Here the hammer fell.]

Mr. REED. Mr. Chairman, I must say that I am surprised to hear the language of the gentleman from Virginia, for no man knows better than he that the legislation to which he has alluded would have received general approval but for the forceful fashion in which it was tried to be put on in this House.

Mr. GOODE. We tried it time and again in separate bills.

Mr. REED. But I am sorry to see in the enumeration of the various benefits received from Rule 120 he has forgotten to enumerate that great benefit yet to accrue to the country from the actions which took place under that rule in the extra session, namely, the extirpation of the democratic party, which is to occur the next time the

people of the United States have an opportunity to pass upon it. [Applause on the republican side.]

It gave the country a good opportunity to see what these gentlemen were so eager to do and what they were disposed to do, and did do, when they had the power; and the result of the airing of the democratic party before the people of the United States is always of great interest and benefit to the country. Not only that, it is not only national but local. Wherever we can get a fair opportunity for a review of that collection of gentlemen, a good result has always followed for the country.

It seems to me bad this matter should be brought up and discussed upon such a basis. We are endeavoring to fix some rule for the government of the House, and we are endeavoring to do it upon principles which will hold not only for the present, but for all future time. I think if we have a mind to come to this question in a dispassionate and decent fashion we will be enabled to fix upon some rule, and that we shall be able to do it by a suitable amendment to this Rule 120. And when the time comes I purpose to offer an amendment to the third clause; of which I wish to give notice now to the House. It is to strike out from the third clause all after the word "order," in the sixth line, and insert the words "but it shall be in order to strike out any sum of money appropriated in a bill and insert a less sum."

That will give every opportunity for retrenchment and reform and reduction of expenditure, and at the same time it will keep out these firebrands that prevent calm and dispassionate legislation. My objection to the proposition presented by the gentleman from Pennsylvania is, among other things, that it presents the idea that an appropriation is necessary in the general appropriations for the interest of the public debt; I believe that that is already provided for under our general appropriation laws.

Mr. SPEER. With the concurrence of the chairman of the Committee on Rules, I move that, as this is a very important subject, the committee rise for the purpose of extending the time for debate upon it.

Several MEMBERS. Oh, no.

Mr. BLACKBURN. I have no objection to that motion being made. I desire to say so far as the Committee on Rules is concerned it does not propose to put any limit on the debate on this rule to-day.

The CHAIRMAN. By a strict enforcement of the rule only five minutes would be allowed in favor of an amendment and five minutes against, but the debate can be extended by means of *pro forma* amendments.

Mr. GARFIELD. Allow me to suggest that for a time at least it seems to me it will facilitate the discussion of this matter if we could have the ten-minute rule instead of the five-minute rule prevail. That would allow a large number of gentlemen to speak, while five minutes is hardly enough in view of the importance of this question and the state of feeling upon it. I believe that if we should agree to adopt the ten-minute rule for to-day it would greatly facilitate the debate.

Mr. RANDALL, (the Speaker.) The House would have to do that, and in the House it could only be done by unanimous consent, for it vacates a rule.

Mr. GARFIELD. Could not unanimous consent be given without the committee rising?

Mr. BLACKBURN. It would require unanimous consent to be given in the House.

Mr. WARNER. In the present state of feeling this debate is likely to take about five hundred minutes, even if we proceed under the five-minute rule.

Mr. HAYES. Does the proposition of the gentleman from Ohio [Mr. GARFIELD] require unanimous consent?

The CHAIRMAN. As the proposition is to change the time allowed for debate, it would be necessary for the committee to rise, and in the House such an order could only be made by unanimous consent.

Mr. WHITE. It strikes me, Mr. Chairman, that the same thing could be accomplished by gentlemen rising and yielding their time to each other.

Mr. WARNER. From the indications, the debate will take three months under the five-minute rule.

Mr. SPEER. I desire now to offer the amendment of which I gave notice some days ago, as follows:

In Rule XXI, clause 3, strike out all after the word "except," and insert—

The CHAIRMAN. The Chair will state to the gentleman from Georgia that the third clause of Rule XXI is not now under consideration. It has not been reached.

Mr. SPEER. I withdraw the amendment, then, until that clause is reached.

Mr. SPRINGER. When this question was before the committee for consideration a few days ago the gentleman from Ohio [Mr. GARFIELD] stated that Rule 120, permitting legislation on appropriation bills, was the rock upon which the democratic party had split. I do not know to what he referred, because the democratic party has not split upon anything. But is the placing of legislation upon appropriation bills unconstitutional or a departure from legislative precedents? Not at all. I want to call the attention of the House and of the country and of the honorable gentleman from Ohio to the fact that during the time when he occupied the responsible position of chair-

man of the Committee on Appropriations of this House in the Forty-second and Forty-third Congresses there were passed by Congress appropriation bills which contained, as I have computed them here, eighty-eight sections of new legislation upon such bills. You can scarcely find one appropriation bill reported to this House during the time the gentleman from Ohio was chairman of the Committee on Appropriations that did not have one or more sections upon it of general legislation. A gentleman near me suggests I should put the sections in my printed remarks. I would have to reproduce a large part of volumes 17 and 18 of the Statutes at Large of the United States in order to show the new legislation on appropriation bills reported and enacted while the honorable gentleman from Ohio was chairman of the Committee on Appropriations. It was during this time the practice to legislate upon the appropriation bills and many of the most important provisions of law enacted during the Congresses when the gentleman from Ohio occupied that position were placed upon those bills.

I call the attention of the committee to the following table of appropriation bills which passed during the Forty-second and Forty-third Congresses and to the sections thereof which contained new legislation:

New legislation on appropriation bills in the Forty-second and Forty-third Congresses, during which time Mr. Garfield was chairman of the Committee on Appropriations.

Mr. BLOUNT. I would like to ask the gentleman from Illinois if there was ever a time when such legislation was not put upon appropriation bills?

Mr. SPRINGER. There never was a time when such legislation was not put upon appropriation bills. And, so far as I am concerned, I assert here that it is a constitutional and righteous mode of legislation, and necessary in many cases; and that the propriety of such legislation is solely within the discretion of the House, and nobody outside of it, or inside of it, has the right to question our authority to legislate in any way we please.

If we give up this rule 120 we give up one of the prerogatives of this House, secured to us by the Constitution, a prerogative which Mr. Madison believed was the greatest and most important to the representatives of the people which was embodied in our Constitution. I refer gentlemen to No. 58 of the Federalist, where Mr. Madison says:

The House of Representatives can not only refuse, but they alone can propose the supplies requisite for the support of the Government. They, in a word, hold the purse, that powerful instrument by which we behold, in the history of the British constitution, an infant and humble representation of the people gradually enlarging the sphere of its activity and importance, and finally reducing, as far as it seems to have wished, all the overgrown prerogatives of the other branches of the Government. This power over the purse may, in fact, be regarded as the most complete and effectual weapon with which any constitution can arm the immediate representatives of the people for obtaining a redress of every grievance, and for carrying into effect every just and salutary measure.

Mr. Madison, who has been appropriately styled the "Father of the Constitution," here informs us that the power of this House over the purse, the power of framing appropriation bills, is a complete weapon for securing "every just and salutary measure" of legislation. The amendment now under consideration would put it in the power of one member to defeat all legislation on appropriation bills, and to

prevent any reduction of expenditures below what are now authorized by law, unless by a two-thirds vote on Mondays the rule could be suspended. We have no right to yield one of the most important powers of this House to the minority. I propose to adhere to Rule 120 as it is. No change is demanded by the people. As Representatives we have no right to surrender our trusts. We must exercise the functions of Representatives in the interest of the people who sent us here. We have the right to make our own rules and to legislate in any manner we may deem best. I deny that any harm has resulted to the people from the operation of Rule 120. I will not consent to its repeal. It is a salutary rule, strictly in accordance with the Constitution of the United States.

The right to legislate upon appropriation bills is one of the surest and most important bulwarks which we have for defending the rights and the liberties of the people. It was never discovered by the gentleman from Ohio [Mr. GARFIELD] that such was vicious legislation until Rule 120 was used by the majority of this House in the Forty-fourth Congress for securing a vast reduction of expenditures.

This rule has been used in the interest of the people to the extent of a reduction of public expenditures to the amount of \$84,000,000 since the majority of this House passed under the control of members of the democratic party. We cannot surrender this power; we must not give it up. We must adhere to the rule as it is, for by it we have already saved many millions of dollars to the people, and if we adhere to it we will save millions more in the same way. Let us stand by this rule. It is the rule adopted by the democratic House of Representatives of the Forty-fourth Congress. We have adhered to it since that time; it has produced no bad results; but on the contrary it has secured many wise and salutary reforms and saved millions of dollars of the people's money.

[Here the hammer fell.]

Mr. WHITE. I rise to make a proposition.

The CHAIRMAN. The gentleman will state it.

Mr. WHITE. I desire to withdraw the amendment which I have offered to the second clause of Rule XXI, inasmuch as the gentleman from Georgia [Mr. SPEER] has given notice of his intention to offer an amendment to the next clause which will accomplish the same purpose. For that reason I withdraw my amendment.

Mr. GARFIELD. Allow me to suggest to gentlemen on the other side that we pass without further debate the second clause, so that we may proceed to consider clause 3 in this rule.

Mr. WHITE. I offered my amendment as a new clause, but withdraw it for the purpose of allowing the gentleman from Georgia [Mr. SPEER] to offer his amendment to the next clause.

The amendment of Mr. WHITE was accordingly withdrawn.

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures.

Mr. SPEER. I move to amend the clause just read by striking out of the latter portion of it the words "except such as, being germane to the subject-matter of the bill, shall retrench expenditures" and to insert in lieu thereof that which I send to the Clerk's desk.

The Clerk read as follows:

But it shall be in order to strike out any sum of money in an appropriation bill and to insert a less sum.

The latter portion of clause 3 as proposed to be amended was as follows:

Nor shall any provision in any such bill or amendment thereto changing existing law be in order, but it shall be in order to strike out any sum of money in an appropriation bill and insert a less sum.

Mr. SPEER. I think that amendment will accomplish the object which is sought to be attained by all of those who desire to see general legislation divorced from the general appropriation bills; and it will also accomplish fully the object of retrenching expenditures when necessary.

Mr. Chairman, in presenting the reasons why general legislation should be divorced from the unnatural union with the appropriation bills, I protest that I am not, in the slightest degree, influenced by partisan feeling. I take no interest in the inquiry who began to affix riders to the appropriation bills. I shall not remind the republican party of the vital legislation they have accomplished by these methods, nor is it necessary for me to occupy the attention of the House in defending the motives of my democratic brethren, their patriotism, or the purity of their purposes in the uses they have made of the same resources.

Sir, if it is possible, at any time, to rise above the sordid considerations of party, it should be in the discussion of rules for the permanent guidance and control of the business of legislation by this House. Mr. Chairman, all men of all parties, it seems to me, must agree that the practice of attaching positive laws on other subjects or on any subject to the money bills of this House is a practice which finds no legitimate parentage in the Constitution of this Government, and is fraught with mischief which at any time and when least expected may become irreparable. To abolish the practice would be a stride in the advancement of political science which would excite

the interest and the admiration of every intelligent patriot in this country.

In the discussion of questions like this we are to some extent remitted to the discussion of elementary principles. The three coordinate departments of our Government are supported by the appropriation bills of the House of Representatives. Have gentlemen considered what the failure of these bills means? I do not mean a temporary failure; I do not mean a failure which can be cured by an extra session of Congress, or which can be tided over by the credit of the Government; but I mean a refusal on the part of the people's Representatives to grant the money necessary to sustain the Government. Sir, it means anarchy; it means the paralysis of every department of this Government; it means the repudiation of the national debt; it means the destruction of the judiciary; it means the abdication of the Executive; it means the dispersal of Congress. Whenever the Representatives of the people permanently and continuously refuse to vote the people's money to sustain the people's Government red-handed revolution or the iron grasp of despotism will seize upon and ravage the unprotected heritage of freemen.

Mr. ATKINS. Has any party ever done that?

Mr. SPEER. I decline to yield to the gentleman. I am not discussing this with regard to party now. It may be very easily demonstrated that the practice of riders on the appropriation bills may at any time eventuate in the refusal of the supplies. If there is one national characteristic of the American people which is strong and intense, it is a strong and intense party spirit. If this characteristic finds unbounded expression and demonstration anywhere, I say with profound deference to this imposing presence, it is in the House of Representatives. Now, sir, let us do what it is not very difficult to do. Let us suppose that the two great parties of this House are divided on what they conceive to be a vital political question. Let us suppose that the measure in which this vital political difference presents itself is in a rider on the Post-Office appropriation bill. Let us suppose that the party which is in a majority in this House is in a minority in the Senate; or that the occupant of the presidential chair belongs to the minority school, the Post-Office bill for the support of the post-roads and post-offices and mail carriers of the great and complicated and beneficent postal system of the United States passes the House with the rider attached.

[Here the hammer fell.]

The CHAIRMAN. The five minutes' time to which the gentleman is entitled has expired.

Mr. HAYES. I will take the floor and yield my time to the gentleman from Georgia, [Mr. SPEER.]

The CHAIRMAN. That will be done if there be no objection.

Mr. COFFROTH. I object. [Cries of "Oh, no!" "Oh, no!" from different parts of the House.]

The CHAIRMAN. Does the gentleman withdraw his objection?

Mr. COFFROTH. I do not.

Mr. HAYES. I hope the gentleman will withdraw his objection. It has been the custom here in discussing questions to allow that to be done.

Mr. COFFROTH. This discussion must stop at some time, and I propose to stand by the rule.

Mr. GARFIELD. Let somebody else speak in opposition to the amendment, and then the gentleman from Georgia can move an amendment to the amendment and speak on that.

Mr. McMAHON. I do not see how that arrangement can be made under the rules.

The CHAIRMAN. The Chair, of course, in recognizing gentlemen will endeavor to conform to the rules.

Mr. BLOUNT. I appeal to the gentleman from Pennsylvania [Mr. COFFROTH] to withdraw his objection to my colleague's proceeding. There is nothing unusual in it; it has occurred in every session of every Congress.

Mr. SPEER. If the gentleman cannot bear to hear my argument, he can make his objection.

The CHAIRMAN. The Chair understands that the objection is not withdrawn.

Mr. SPEER subsequently obtained the floor, and concluded as follows:

When interrupted I was giving a hypothetical case of the effect of a rider of political legislation on the Post-Office appropriation bill. The Senate refuses to concur. On a committee of conference, both the Senate and the House decline to recede from their positions. Neither party desires to strike down the postal system. The political rider is the rock on which they split. They are conscientious, and they will not surrender their convictions. They are firm, and they will not abate a jot or tittle of their just demands. The closing hour of the session approaches. The session expires. Not a dollar is voted for the maintenance of that system which to-day is one of the greatest agencies of civilization on the earth, without which no modern nation can preserve its decency, and whose destruction will carry confusion and misery and distress into the home of every American citizen. Sir, it is the political rider that has done the work. Sir, is this contingency impossible? Is the picture fancifully drawn? What man among you is there who can lay his hand on his heart and, with the history of this country in his memory, say that the conjuncture which I have foreboded is either impossible or improbable?

Mr. Chairman, to place a measure of general legislation on an appropriation bill which must of necessity be passed deprives the Representative of all opportunity of criticism or of independent action with regard to that measure. How is it possible in the closing hours of a session for the Representative to make his notions of right and wrong effective, when if he votes against the general legislation he must of necessity vote against the entire appropriation? He must vote for the bill, or he may defeat the appropriation. He surrenders, may be, his judgment and his conscience, and votes for the bill with the rider attached. Or he votes against it, and is liable to have his motives misconstrued, and not improbably will incur the disapproval of others when perhaps he least deserves it. But, sir, it is not alone the independence of the Representative to which this practice is inimical, but it is aimed likewise, whether intentionally or not it matters not, at the independence of the other branch of Congress and at the independence of the Executive.

Sir, the most admirable feature of our most admirable system is the complete independence of its co-ordinate branches. It was said by Hamilton, in the *Federalist*, along with his honest, zealous, luminous, and masterly advocacy of the Constitution, "that no political truth is of greater value, or stamped with the authority of more enlightened patrons of liberty, than that the legislative, executive, and judicial departments ought to be separate and distinct, and that if this Constitution was justly chargeable with a mixture of these powers no further argument would be necessary to inspire a universal reprobation of the system."

Montesquieu, before the day of Hamilton, in his oracular treatise on this subject, had declared "there can be no liberty where the legislative and executive powers are united in the same person or body of magistrates, or if the power of judging be not separated from the legislative and executive powers."

Now, sir, does not the political rider destroy this independence? Is it not intended as a threat to the Senate and to the Executive? Does it not impliedly declare that the money shall not be forthcoming to sustain the Government unless the Senate and the Executive will accede to the demands of the House of Representatives? We have, within the past decade, been regaled with a great deal of eloquence in the discussion of measures of this character on the subject of parliamentary heroism. What does parliamentary heroism in this connection mean? It means, sir, to refuse to vote the money unless the Senate or the Executive shall conclude to coincide with the House of Representatives.

Now, sir, is not this an illegitimate exercise of our prerogative? Has not the Senate the same constitutional right to pronounce upon the merits of a measure that we have? Has not the President, with the power of the veto, functions just as important toward the enactment of law as Congress itself? And yet, though it is our imperative duty to sustain all the departments, when we send the Senate and the President an appropriation bill, with the proviso attached, it means that we will consent to support the Government, provided you, the Senate, or you, the President, will consent to agree with our proviso. This is usurpation. This is the aggrandizement of senatorial prerogatives and the veto power in the House of Representatives. But, sir, there is another most insidious effect which this species of legislation may have upon the independence of the executive and judicial departments of the Government. I am discussing this question abstractly; I am speaking impersonally. I mean the facility it gives to Congress to withhold the salaries of the officers of these departments beyond the period of payment fixed by the Constitution. It is useless for gentlemen of an optimistic turn of mind to deny the proposition that the control over a man's salary is very likely to be a control over his will. Human nature is pretty much the same thing it always has been. We have advanced but very little toward that state of perfectibility which was imagined by Plato while dreaming in the gardens of the academy. It was for this reason that the Constitution wisely provides that the President shall receive for his services a salary which shall be paid at stated intervals, and shall neither be increased nor diminished during his term of office. In similar terms, it provides that the judges of the supreme and inferior courts shall at stated times receive for their services a compensation which shall not be diminished during their continuance in office. The Constitution seeks to deprive Congress of the power of discretionary action with regard to the salaries of these officials.

Sir, I again cite the authority of Hamilton, whose splendid exposition of the Constitution cannot be too frequently or too carefully consulted by those who desire to place a patriotic and rightful interpretation upon that instrument. It is in the *Federalist*, in the seventy-third number, that he declares "the Legislature, with a discretionary power over the salary and emoluments of the Chief Magistrate, would render him as obsequious to their will as they might think proper to make him. They might in most cases either reduce him by famine or tempt him by largesses to surrender at discretion his judgment to their inclinations. There are men," he continues, "who could neither be distressed nor won into a sacrifice of their duty, but this stern virtue is the growth of few soils, and in the main it will be found that a power over a man's support is a power over his will. It is not competent for Congress to weaken the fortitude of the President by operating upon his necessities, nor corrupt his integrity by appealing to his avarice."

Sir, the same reasoning applies with equal force to the injurious effect on the independence of the judiciary, which a discretion to delay and refuse the salaries of the judges would occasion. But it will be contended that the political rider on the appropriation bill will not diminish the constitutional salaries of these officials. Sir, it will directly diminish such salaries. At best it postpones the payment. This deprives the President or the judge of the use and interest of his money, which is to diminish the salary. It does more. It violates that provision of the Constitution which declares that the salaries shall be paid at stated times. That is to say times which are to be fixed by law. To illustrate: the statutes now declare that the salary of the President shall be paid monthly. This was the law when he was inaugurated, and cannot lawfully and rightfully be changed so as to affect his salary during his term of office. In other words, he has an undeniable, vested right to monthly payments.

Now, sir, I ask what difference does it make to the rights of the President whether you postpone the payment of his salary until his term of office expires, or whether, because of a political rider on the appropriation bill about which you disagree, you do not vote the money to pay his salary until his term of office expires. To him the effect is the same. He is deprived of his money. The Constitution which sought to deny to the Legislature any control over the emoluments of the Chief Magistrate during his term of office is disregarded and nullified; and, dependent upon your caprice for a support, to recall the language of Hamilton, "you may reduce him by famine or tempt him by largesses to surrender his judgment to your inclinations." Sir, is it safe? Is it wise? Is it patriotic? Is it indicative of permanency and durability in our institutions when constitutional and fundamental distinctions are obliterated upon the merest pretext of the exigency of the moment, upon the most insufficient reason of party necessity?

Sir, gentlemen are fond of citing British precedents for the practice of refusing the supplies as a legitimate parliamentary resort. I should be delighted to hear the distinguished parliamentarians who so earnestly and zealously contend for the rider on the appropriation bills point out the analogy between the refusal of the British Parliament to vote a gratuity to a French sovereign to carry on one of his wars and the refusal of the American Congress to pay the men who have devoted the best years of their lives to the public service the compensation for their meritorious services. The cases are entirely dissimilar. When in British history, save in times of actual revolution, did this "parliamentary heroism" refuse to maintain every department of the government, from the chief-justice of the realm to the light-keeper on Eddystone Reef? The waves of party feeling have run as high in Great Britain as in America. They have submerged the lives and the reputations of the most illustrious patriots. They have dashed with all the fury which the whirlwind of passion could impart against the granitic foundation of that unwritten constitution. But, sir, the government was maintained in all of its usual functions; and though the eloquence of Pitt and Fox had lashed the public mind into a frenzy of sympathy, though the death grapple of Brougham and Canning made the world hold its breath, the British public were secure; they were confident; they did not question that their institutions would survive the struggle.

Sir, children yet unborn will pronounce blessings upon the Forty-sixth Congress of these United States, if by your wisdom you relieve the public mind from the possibility of apprehension that your institutions may be destroyed, your Government paralyzed, your departments disorganized, your armies disbanded, your fleets scattered like the Spanish armada, by withholding, from the excess of party spirit, the power to deprive this great Government of its usual, its legitimate, its necessary support. Sir, if gentlemen suppose that in this discussion of an abstract and yet a most practical question I have any allusion to the action of any party, they entirely mistake the scope of my remarks. I do not mean to say that any rider on any appropriation bill would have occasioned the consequences which I have depicted, but these are consequences which may ensue at any time, and this in itself is sufficient argument that the practice is to be deprecated, must be abandoned. Will it require any particular degree of fortitude or patriotism for gentlemen to support the reform which I advocate? I know that it will place it out of the power of the majority to repeal at present certain measures of political legislation which I most heartily desire should be blotted from the statute-book, but the good to be attained is worthy of that sacrifice.

Let us divorce general legislation from the appropriation bills. Let us enter up a decree of perpetual divorcement, and we will have given to the republican party, to the people, to history, and to the world a signal instance of what the Representatives of the American people are willing to do and to suffer in the cause of that free Government which was conveyed to them in title deeds indented with the good swords of their revolutionary sires. Sir, when the Continental Army, with unparalleled devotion to country and to liberty, had fought out the great battle of revolution which gave liberty to a continent and the hope of freedom to the world, in the hour of their final triumph insidious efforts were made to induce them to misuse the strength which had crowned their sacrificial struggles with victory. The poison worked rapidly, and the agitation of the troops was alarming. Washington, apprised of the designs of the mischievous advisors, appeared in a meeting of the general and field

officers, and conjured them to adhere to the line of moderate counsels and patriotic duty.

By thus determining and thus acting—

Said he—

you will pursue the plain and direct road to the attainment of your wishes; you will defeat the insidious designs of your enemies, who are compelled to resort from open force to secret artifice; you will give one more signal proof of unexampled patriotism and patient virtue, rising superior to the pressure of the most complicated sufferings, and you will, by the dignity of your conduct, afford occasion for posterity to say, when speaking of the glorious example you have exhibited to mankind, "had this day been wanting, the world had never seen the last stage of perfection to which human nature is capable of attaining."

Sir, under changed conditions this House may profit by the timely admonitions of Washington. The peace of the country, the regular discharge of all the functions of the Government, the confidence of our commercial and industrial interests, the quiet of the public mind, and, above all, the supreme necessity of maintaining the Government, are so far superior to the importance of any mere party victory that reason will not brook hesitation, and patriotism but obeys the dictates of reason.

Sir, as no man can question the consistency of my opinions upon this subject, so no man should doubt the sincerity of my convictions or the patriotism of my motives. Sir, I reiterate that the political rider on the appropriation bill imports that the money to maintain this Government may be refused at any moment. Refuse the supplies, and your Government will be first palsied, then paralyzed; refuse the supplies, and the mariner, as he approaches your shores, will look in vain for the welcome ray of the light-house to warn him from hidden dangers or to direct him to the secure harbor and the placid roadstead; refuse the supplies, and thousands of families of innocent women and children who depend for their support on the good faith of the Government will suffer from hunger and penury; refuse the supplies, and in the absence of the gallant defenders of our border the vile peons and fierce banditti of Mexico will sweep across the frontier, and devastation and robbery, rapine and murder will mark the places once the happy homes of your citizens. Leave the Indian frontier unprotected, give unrestrained license to the cruel tribes of merciless and revengeful savages, even now with difficulty restrained by the mailed hand of the Government, and picture, if you can, the shapes of terror and despair which will sit for household gods upon the hearths of the people of your western borders. Refuse the supplies, and you shake the credit of the Government at home and abroad; you humiliate the American people; you shake the confidence of the world in the stability of our institutions; and instead of a secure, and peaceful, and prosperous country of refuge for the toiling subjects of despotism and victims of tyranny in the Old World, you will afford the spectacle of a decaying republic, a government torn by great and ambitious factions, and where power has usurped the prerogative of the law.

Sir, I do not arrogate to myself any love of country superior to those with whom I am associated. I am sure it is the proudest delight of the American citizen to dwell upon the marvelous future which it requires no prophetic eye to see is the inheritance of this great Union of States. There is but one danger ahead of us, and that is that we may be induced to take some departure from the Constitution. As long as we hold to this rock we are safe. There is no wave of popular commotion strong enough to sweep us down. Let us hold to the Constitution; let us support the Government; then, esteeming country superior to party; then on the plane of a common humanity, a common destiny, a common brotherhood, a common country, oblivious of the past, let us labor to protect the liberties, to increase the happiness of the Union, and to augment the prosperity of that goodly heritage with which Divine Providence has blessed the American people.

Mr. HAWLEY. Mr. Chairman, I shall try to continue this discussion in the good temper manifested by my friend from Georgia. I speak now utterly without regard to partisan views, and my argument will be chiefly historical.

Attention was called during the debates of the extra session last summer to the existing rule of the British House of Lords which prevents "tacking," as the phrase there is, to appropriation or "supply" bills in the House of Commons, the express purpose of that rule being to protect the House of Lords in the exercise of its independent judgment. This question has not been without discussion and consideration in this country outside of this House, and long before either of the present political parties had in view any partisan purpose in connection with this question. I have collated references to the constitutions of all the States of the Union, and I will briefly refer to them.

Alabama in her constitution of 1865 provided that "each law shall embrace but one subject, which shall be described in the title." The constitution adopted by the same State in 1875 contains this provision:

Each law shall contain but one subject, which shall be clearly expressed in its title, except general appropriation bills, general revenue bills, and bills adopting a code, digest, or revision of statutes.

The constitution of Arkansas, adopted in 1868, provided that—

No act shall embrace more than one subject, and that shall be embraced in its title.

The constitution of the same State, adopted in 1874, provides—

The general appropriation bill shall embrace nothing but appropriations for the ordinary expenses of the executive, legislative, and judicial departments of the State. All other appropriations shall be made by separate bills, each embracing but one subject.

The constitution of California, adopted in 1849, (I have not the last one), declares—

Every law enacted by the Legislature shall embrace but one subject.

Colorado in her constitution, adopted in 1876, has provided—

No bill, except general appropriation bills, shall be passed containing but one subject, which shall be clearly expressed in its title.

And any such act is made void as to so much as is not expressed in its title.

The constitution of Connecticut, which was adopted in 1818, contains nothing on this subject.

Delaware by constitution adopted in 1831 provides that—

All bills for raising revenue shall originate in the house of representatives; * * * nor shall any matter or clause whatever, not immediately relating to and necessary for raising revenue, be in any manner blended with or annexed to a bill for raising revenue.

Several of the State constitutions contain provisions of this character, which are equivalent to a prohibition of legislation on appropriation bills, because in the olden time many of the States did not, as some do not now, pass annual appropriation bills, but had standing laws under which the annual expenditures were made.

Florida in her constitution of 1868 has declared—

Each law enacted in the Legislature shall embrace but one subject, and matters properly connected therewith, which subject shall be briefly expressed in the title.

The constitution of Georgia, adopted in 1865, contains the following:

Nor shall any law or ordinance be passed which refers to more than one subject-matter, or contains matter different from what is expressed in the title thereof.

The constitution of the same State, adopted in 1868, contains the same provision. The constitution of Illinois, adopted in 1870, provides:

No act hereafter passed shall embrace more than one subject, and that expressed in the title.

And an act is made void as to so much as is not expressed in the title. Indiana, in her constitution of 1851, has declared:

Every act shall embrace but one subject and matters properly connected therewith, which subject shall be expressed in the title.

Any provision in violation of this is declared void.

The constitution of Iowa, adopted in 1857, contains the same provision as that I have just read from the constitution of Indiana. Kansas in her constitution of 1855 (and substantially in the constitutions of 1857, 1858, and 1859) provides:

Every act shall contain but one subject, which shall be clearly expressed in its title.

Kentucky, by her constitution of 1799, provides that revenue bills shall originate in the house, but the senate may amend, not introducing new matter not relating to raising revenue. Her constitution adopted in 1850 contains a similar provision.

A clause of the same kind is to be found in the constitutions of Louisiana, as adopted in 1812, 1845, 1852, and 1868. As to the last constitution of Louisiana I have no information. A similar provision is found in the constitution of Maine, adopted in 1820.

Now I call the attention of members, and especially of my friends from Maryland, to the constitution of that State adopted in 1776—a very good year. The section on this subject is a very strong one, giving the reason why legislation should not be contained in "money bills;" namely:

That the senate may be at full and perfect liberty to exercise their judgment in passing laws, and that they may not be compelled by the house of delegates either to reject a money bill which the emergency of affairs may require or to assent to some other act of legislation, in their conscience and judgment injurious to the public welfare, &c.

The house of delegates is forbidden to blend with bills to raise or apply money any matter not immediately relating thereto and necessary therefor.

The constitution of the same State, adopted in 1851, declares:

Every law enacted by the Legislature shall embrace but one subject, and that shall be described in the title.

The constitutions of the same State, adopted in 1864 and 1867, contain a similar provision.

Massachusetts retains her old constitution of 1780, which contains nothing directly on this subject, except the provision that money bills shall originate in the house and the senate may amend such bills.

The constitution of Michigan, adopted in 1835, does not touch this subject; that of 1850 provides that:

No law shall embrace more than one subject, which shall be expressed in the title.

The constitution of Minnesota, adopted in 1857, and the constitutions of Mississippi, adopted in 1817, 1832, and 1868, contain no provisions on this subject. Missouri, in her constitution of 1865, has declared—

No law enacted by the General Assembly shall relate to more than one subject, and that shall be expressed in the title.

It is provided that anything further than this shall be void. And a constitutional provision of 1875 is to the same effect.

Nebraska, by a constitutional provision adopted in 1866, and again in 1875, provided that—

No bill shall contain more than one subject, which shall be clearly expressed in the title.

The constitution of Nevada, adopted in 1864, contains the following:

Each law enacted by the Legislature shall embrace but one subject and matter properly connected therewith, which subject shall be briefly expressed in the title.

New Hampshire, having no constitution of later date than 1792, has no provision on this subject.

I come now to the constitution of New Jersey, adopted in 1844, before these contests had begun. Hear this provision from the constitution of New Jersey:

To avoid improper influences which may result from intermixing in one and the same act such things as have no proper relation to each other, every law shall embrace but one subject, and that shall be expressed in the title.

I next read from the constitution of New York, adopted in 1846:

No private or local bill which may be passed by the Legislature shall embrace more than one subject, and that shall be expressed in the title.

But although New York has no direct provision on this subject as to general legislation, her constitution allows the governor to veto one or more items in an appropriation bill, while approving other portions of the bill, thus enabling the executive to escape the compulsion of "tacking."

The constitution of North Carolina adopted in 1876 contains no provision on this subject. Ohio, in her constitution of 1851, has declared—

No bill shall contain more than one subject, which shall be clearly expressed in its title.

Oregon, in her constitution of 1857, has provided—

Every act shall embrace but one subject and matters properly connected therewith, which subject shall be expressed in the title.

Pennsylvania, by constitutional provision adopted in 1873, has declared—

No law shall be passed except by bill; and no bill shall be so altered or amended on its passage through either House as to change its original purpose.

No bill except general appropriation bills shall be passed containing more than one subject, which shall be clearly expressed in its title.

And furthermore, the governor shall have "power to disapprove of any item or items of any bill making appropriations of money making distinct items," the items so disapproved to be subject to the limitations prescribed for other bills vetoed.

Rhode Island, whose constitution was adopted in 1841, has no provision on this subject.

The constitutions adopted by South Carolina in 1865 and 1868 respectively contain the following:

Every act or resolution having the force of law shall relate to but one subject, and that shall be expressed in the title.

The constitution of Tennessee adopted in 1870 provides—

No bill shall become a law which embraces more than one subject, that subject to be embraced in the title.

Texas, by constitutions adopted respectively in 1865, 1868, and 1876, gives the governor power to veto separate items of appropriation bills while approving others, and he is allowed twenty days after the adjournment of the Legislature to decide upon approval or disapproval and make proclamation thereof. The constitution of 1876 also provides:

No bill (except general appropriation bills which may embrace the various subjects and accounts for and on account of which moneys are appropriated) shall contain more than one subject, which shall be expressed in its title.

And so much as is not thus expressed is to be void. I consider the constitutional provisions of Texas and Pennsylvania the best on the subject to be found in the Union, and they completely protect the several branches of their government from the tyranny of legislation in money bills.

The constitution of Vermont, adopted in 1793, contains nothing on this subject. Virginia, in her constitutions of 1850, 1864, and 1870, respectively, has provided that—

No law shall embrace more than one object, which shall be expressed in its title.

The constitution of West Virginia, adopted in 1861-'63, corresponds on this subject to that of old Virginia. The constitution of 1872 declares that—

No act hereafter passed shall embrace more than one object, and that shall be embraced in its title.

Anything further is declared to be void.

Wisconsin, by her constitution of 1848, provides merely that private or local bills shall contain one subject.

By this review it will be seen that the constitutions of twenty-five States imperatively forbid that bills shall embrace more than one subject. Some of them give emphatic reasons, such as republicans have urged here in debate. In some cases the provisions are minute and careful, and in some the governor is permitted to veto items or parts of appropriation bills while approving the remainder. Five constitutions, ranging between 1779 and 1780 and 1831, assert the same principle and aim at the same effect by giving the initiative in revenue bills to the lower house and forbidding the upper house to add any foreign matter. These may properly be included, so that we

have thirty of the thirty-eight State constitutions, ranging in their years of birth from 1776 to 1876, under federal, democratic, whig, republican, and other party auspices, North and South, East and West, before, during, and since the rebellion, which give solemn and deliberate judgment against that oppressive and revolutionary combination of "money" or "supply" or "appropriation" bills with general legislation which the democratic party is seeking to maintain in the face of the wisest precedents in the history of modern parliamentary government.

[Here the hammer fell.]

Mr. COX. Mr. Chairman, I perfectly agree with my friend from Connecticut [Mr. HAWLEY] that we ought if possible to guard our appropriation bills against these extraneous matters. I know that all at once, on the other side of the House, since they are in a minority, there is an impulse to cut off all "riders" from appropriation bills. I applaud the diligence of the gentleman from Connecticut in making this collation of authorities. I made the same point at the extra session of this Congress, as will be found by reference to my speech of April 17, 1879; but I made one important reservation. While I would not encourage a loose construction of Rule 120, while I would not pile upon appropriation bills whole codes of legislation, I would nevertheless, under a fair ruling of the Speaker, use that rule for retrenchment. I would not, if I could help it, use it for other purposes except this: I would resort to "riders" for the purpose of repealing laws which had been enacted in the form of "riders." This is what I said at the extra session—to repeal a mischievous law by legislation upon an appropriation bill is by no means a similar case with its enactment. I would use this power in a negative way to strike down vicious legislation.

Rule 120 has served a noble purpose. It enabled the Committee on Appropriations in the first session of the Forty-fourth Congress to cut down the estimates from \$65,000,465.77 to \$40,430,172—a saving of \$25,000,000. The House also under this rule made a reduction of nearly \$25,000,000 upon the estimates, and a reduction of nearly \$25,000,000 upon the appropriations of the year before. Thus at the lowest calculation we saved that Congress about \$40,000,000 as claimed by the Speaker of this House and other gentlemen, basing their calculation upon tabular statements. Even on the other side of the House it was confessed—notably by the present governor of Ohio, Mr. Foster—that by this rule we have saved in our legislation during the Forty-fourth Congress \$21,000,000 per annum.

Why did not gentlemen on the other side commence their saving after the war? Ten years after the war they had the opportunity had they followed democratic precedent to have saved over \$200,000,000, and yet the gentleman from Maine [Mr. REED] talks about airing the democratic party. He says the country is all the better when it is aired. Why, Mr. Chairman, if airing the extravagance of the republican side of the House does it any harm we will keep on airing it. The people like economy. If we could have saved over \$200,000,000 under this rule, let us stand by the rule, giving it a proper interpretation. If the gentleman wants to go before the people with such an exhibit, let him go.

He says with the hilarity which becomes such prophecies, when we go to the people we will be beaten. I do not know about that. I never crow until I am over or out of the woods. It would not be wise for the gentleman to talk about what will be the future. One thing is sure, however, and that is that out of the black mud of radical abomination there did arise economy, there did arise the lily of democracy. [Applause.]

Mr. SPEER. I will withdraw my amendment for the present and yield to the amendment of the gentleman from Alabama.

Mr. LOWE. I offer the following amendment as a proviso to the third paragraph, and ask that it be reported to the House.

The Clerk read as follows:

Provided, however, That no provision or amendment of a partisan character shall be in order.

Mr. LOWE. The rule, Mr. Chairman, under consideration, is fair on its face; it retrenches expenditures and favors economy. But, sir, the power it confers on the committee "to change existing law" is of a doubtful, if not dangerous character. It was used during the extra session, may I not say abused, to intrude politics into the appropriation bills, and to needlessly alarm and agitate the country. We all remember, indeed, sir, we can never forget, what a gust of passion arose in the House and swept over the nation. I am sure that none of us are willing to invite a recurrence of such scenes. I thought then as I think now—reflection confirms my opinion—that political riders on bills essential to the Government are unwise in practice, revolutionary in tendency, and contrary to the spirit and genius of the Constitution. They call in question the veto power, and attack the executive department. The President's right to veto a bill is, of course, as absolute as the right of Congress to pass it. It is an express grant of power. But Congress denies, in effect, this right when we force the Executive to exercise it with peril to his conscience or to his administration; when we place him in a dilemma, with the alternative to yield his political convictions or to stop the Government. In other words, sir, we virtually deny his right to veto.

The departments, Mr. Chairman, are co-ordinate branches of the Government, and under the organic law each is, of course, absolutely independent of the others. "This," in the language of Mr. Calhoun,

"is the beautiful and profound system established by the Constitution." I speak, sir, as a democrat—a federalist. The whole current of authority sustains me. The preservation of the rights of the States, which are but the reserve powers of the people, has always been a cardinal doctrine of the democratic party. But not more so—not older in point of time, nor more sanctioned by reason and authority—than the doctrine of the limitations of the departments; the freedom of each from the others and the restriction of all to their exact duties under the Constitution. Indeed, sir, the rights of the States and the autonomy of the departments are connected as interdependent constitutional questions. Under that system, fairly enforced, I am not afraid of the power of the Executive. Aside from other considerations, impeachment is an all-sufficient check upon him.

If danger shall threaten our institutions, it will not develop itself, I think, in that department. The great Carolinian to whom I have already referred, in his luminous and exhaustive argument in favor of the veto power, enlarges upon its "conservative character" and "salutary, restraining influence;" upon its tendency to "soften sectional feeling and party spirit," and to bring out "a more full and perfect response from the voice of the people." Indeed, sir, Mr. Calhoun did not distrust, but rather sought to magnify the veto power. And this is true also of Mr. Jefferson. Although jealous and distrustful of all government, he had but little apprehension from "the one-man power" in this country. He feared at first the Federal judiciary, "the sappers and miners of the Constitution;" but subsequently, later in life, he expressed the gravest fears from "the turbulence and aggressions of the legislative department." This also was Mr. Madison's opinion, and shared to a large extent by Mr. Hamilton, Judge Marshall, and the earlier writers on our Government; and I may add that this is also the recent view of the venerable and illustrious author of "The War Between the States." I regret, sir, that my own humble observation and limited experience leads me to the same conclusion.

If danger ever assails our institutions from within the system, I fear it is more likely to come, and more dangerous when it does come, not from the veto, but from an oligarchy in Congress led away by party passion and inflamed with the lust of party power. We hold the discretionary authority, necessarily indefinite, to enforce express grants by "appropriate legislation." Nothing is more liable to perversion and abuse. And moreover, sir, we must consider that almost every encroachment by Congress tends to facilitate and open the way to aggressions from the other departments; increasing, for instance, the patronage of the Executive and enlarging the jurisdiction of the courts. I think, therefore, in view of these and other considerations, that the veto power imposed by the Constitution as a check on Congress is a wise and wholesome restraint. It should be preserved in all its constitutional vigor. The Executive himself is more liable to lose than to gain by its exercise; more likely, in the nature of things, to relinquish than to acquire power.

Mr. Chairman, I hold in my hand a valuable relic, preserved in the Library of the House, an original copy of the confederate constitution. This document—the wisdom of the South after eighty years' experience in the old Government—is a strong and pertinent authority to the point under present discussion. It enlarges the veto power. It gives the President the right to "approve any appropriation and to disapprove any other appropriation in the same bill." It embodies in an express provision the canon of parliamentary law we now seek to enforce. This certainly is good democratic authority, or used to be, for one side of this House; and must also commend itself to the republicans here as an advanced position of hostility to "coercing the Executive," or to "starving the Government." It obviates, in the outset, every possibility of conflict between the two departments. The House, moreover, has not forgotten that President Grant in his annual message in 1873 advised an amendment to the Federal Constitution very similar to the provision I have quoted from that of the confederacy. It seems that having captured that constitution in war he was wise enough to utilize it in peace.

Indeed, sir, his language and purpose seem to go as far if not farther in the line of executive power than was contemplated by the South. He recommends that the President be authorized to "approve so much of any measure of Congress as his judgment might dictate, without approving the whole;" not appropriations alone, but "any measure of Congress." And why not? It would allow the Executive, by his own veto, without the need of this rule, to protect himself and party, and would to that extent be an additional check upon Congress.

This, Mr. Chairman, has, of late years, been the general drift of public sentiment throughout the country. Identical provisions, or provisions very much to the same effect, may be found in all the recently revised State constitutions—in those of Alabama, Arkansas, Illinois, Texas, Georgia, Louisiana, Maryland, Missouri, Nebraska, Ohio, Oregon, Pennsylvania, Virginia, and West Virginia; and also in the legislative enactments and parliamentary rules of a majority of the States. They are all designed, sir, and wisely designed, to preserve the executive from usurpations by the legislature.

It may be remembered, sir, that during the extra session I moved to strike the rider from the Army appropriation bill, because I thought then, as I think now, that it was an encroachment by Congress upon the Executive. I sought in vain to save the House and the country

from the evil results that have since accrued in the defeat of the democratic party and the triumph of the united North over the solid South on sectional and sentimental issues. I never doubted the honest but rather small economies of this rule. I never questioned the thrifty motives of the majority. I think I fully appreciated their position. In fact, sir, we were very well agreed on measures, but differed as to means. I opposed the so-called "army at the polls"—an imaginary, fictitious evil—and also "political oaths" and "partisan juries;" but neither then nor now, sir, would I seek to enforce my opposition by doubtful and absurdly inadequate methods.

To be candid, sir, we all know that the extra session was, at bottom, a party fight for power—a struggle for position in 1880 between a Congress of one party and an Executive of the other. The issues have passed away as if they had never been, coming and going at the instance of a few men in this House. But it may be well, in the calmness of this moment, to inquire what interest the people, the country at large, had in that struggle. If I am not greatly mistaken they had this interest, from first to last, whether of one side or the other, to keep each department within the prescribed limits of the Constitution and laws. The mere contest for party power seems over, but, sir, that paramount and abiding interest remains. That is the only concern I feel in the result of this debate and in the final action of the House.

Mr. Chairman, it is objected that my proviso gives whoever may be Speaker the right to judge what constitutes "partisan amendment." I am aware of the apparent force of this objection. The power to decide is discretionary, and therefore indefinite; but I am reluctant to believe that any one chosen to the high position of Speaker would basely stultify himself before the House and the country. It will, of course, be a matter of personal judgment and conscience. But in the light of this contemporaneous debate, no honest mind could well doubt as to what is meant by an "amendment of a partisan character." But if by possibility any doubt should arise, we would not be remediless; we would have a remedy in an appeal to the House. And that remedy, under the circumstances, would be absolute and conclusive: for if the members voting on the appeal should actually divide on the lines of party, that fact of itself would ascertain the truth, vindicate the minority, and sustain the subsequent veto of the Executive.

But, sir, I am not wedded to my own proposition. I would gladly abandon it for something better. I should prefer to retain the economic features of the rule with my amendment as a proviso against perversion and abuse. But, if necessary to enforce the general views I have expressed, I will vote for the amendment of the gentleman from Pennsylvania, [Mr. CLYMER,] or for the amendment of the gentleman from Georgia, [Mr. SPEER,] and act outright with those who oppose all general legislation on these bills. I believe a majority of the committee desire to settle this vexed question now, as far as the rules can settle it. An amendment to the Constitution such as that adopted by the confederacy, or as that recommended by President Grant, would no doubt be the most efficient remedy; but in the absence of such provision I favor the next best thing that can be done by the House. I trust both sides will come to some agreement to abandon the vicious and dangerous practices which of late years, under both parties, have grown out of this rule, and to return to the normal and legitimate methods of legislation.

Mr. McLANE. Mr. Chairman, I rise to oppose the amendment and support the original rule. I am very much struck with the fact that all the opposition to this rule, although it develops the charge of partisanship against those who advocate it, I am struck by the fact—I say, that the whole spirit of the opposition to the rule is a partisan spirit. The rule itself is the rule of this House under the Constitution of the United States, and it might with perfect propriety allow all legislation on appropriation bills, so far as the Senate is concerned, and so far as the Executive is concerned. The Senate now do permit legislation on appropriation bills and nobody has ever contended that the rules of the two bodies ought to be uniform; or that we had any right to complain that the Senate permitted original legislation on appropriation bills, provided we of the House enjoyed our right to originate the title. This right to originate is our only constitutional right; that once settled, each House is left to its own discretion as to how it shall regulate itself in the details of legislation.

The truth is that all that can be said against the rule is against the administration of the rule. It is the abuse of the rule and not the rule itself; and gentlemen who now oppose the rule have throughout the whole history of this country, so far as its political organization is concerned, set the example of excessive abuse of the rule. The gentlemen on the other side of the House have for twenty years given the very construction to the rule which they now oppose. It is the abuse of the rule, and the abuse of the rule as developed by the republican party for the last twenty years, to which all criticism and reproach and all opposition should be directed. By the rule it is intended to have a sure rule for conservative legislation. The rule itself confines legislation to the objects authorized by law. It is, therefore, in its essence exactly what gentlemen on that side of the House say it ought to be. In so far as it has been extended beyond objects authorized by law, it confers a power to reduce expenditures authorized by law. There is nothing in the rule which justifies new legislation or increased expenditure. The gentleman from Georgia,

[Mr. SPEER,] who was interrupted in his speech, had developed it just enough to make the point that this rule admits of riders to appropriation bills. It admits of no such thing. It is the abuse of the rule through which you reach riders; and those who encourage the gentleman from Georgia in his opposition are those who have most abused it and yet declaim against it. The rule itself confines legislation to objects authorized by law, and then confers upon this House the right to reduce all expenditures already authorized by law.

That the rule has been abused is an open secret; and I say, without fear of contradiction, that the abuse of this rule since it was made a rule has been all the time, until the Forty-fourth Congress, under the control of the other side of the House. We have had no opportunity to abuse it, and there is no necessity for any democrat to feel himself embarrassed by an allegation that he has abused this rule. The democratic party have not had power in this House for twenty years nearly prior to the Forty-fourth Congress. When the latter part of this rule was adopted they obtained power in that Congress, when this rule was modified and used to retrench expenditures.

In so far as it has been loosely construed by the democratic House, we have but followed the acknowledged established precedent of gentlemen on the other side of this House when the whole Government was controlled by the republican party. And it seems to me out of all reason that gentlemen should place their opposition upon an allegation so totally unfounded in fact as that which is alleged that these "riders" to appropriation bills are part of the policy of the democratic party. It will be well to adhere to the original rule, as modified in the Forty-fourth Congress, and to the policy of retrenchment and reform then inaugurated.

[Here the hammer fell.]

Mr. SPEER. I move as a substitute for the amendment of the gentleman from Alabama [Mr. LOWE] the following:

After the word "order," next to the last line, insert the words: "but it shall be in order to strike out any sum of money in an appropriation bill and insert a less sum."

Mr. SPEER took the floor and concluded his speech. [See page 854.]

Mr. BLOUNT. Mr. Chairman, my colleague [Mr. SPEER] unfortunately confines himself to a single illustration of the use of this rule, and bases his entire argument on that single condition of facts. The question is whether there shall be any change of this rule, and whether or not you shall legislate on an appropriation bill at all. That is the question. Gentlemen may attempt to devise language with great ingenuity, but when they come to put it into practice it will be found at last it is but the simple question, whether we can legislate on appropriation bills.

My colleague suggests in his amendment we may legislate to reduce the amount. Suppose that be adopted, and you provide for reduction on appropriation bills of the compensation of postmasters, reducing the amount appropriated for their salaries? Suppose you reduce the amount to be paid to railroad companies? Suppose you provide for reduction in any branch of the public service? Now, will any gentleman undertake to say that this Government is not bound by the amount of compensation which the law prescribes, and not the amount voted in the appropriation bill? The result of such a course, in providing not for a change of the law, but simply as my colleague proposes for reducing the amount appropriated would create only a deficiency of appropriation which would have to be supplied afterward. The party whose compensation was reduced would come here and say, "Your law prescribes I shall have a certain salary for the discharge of the duties of the office which I hold, and you have not in the appropriation bill provided enough to pay that salary." That is the attitude in which we would be placed by the adoption of the amendment of my colleague; and if we should reduce the appropriations without changing the law, we should be constantly asked to pay claims for the balance of the amount due under the law.

Gentlemen on the other side suggest we should provide there should be no partisan legislation allowed on appropriation bills. What is partisan legislation? Has it any technical signification? How do we understand there is a party issue upon any proposition? That is to be developed hereafter when it is brought before the House for action. Differences cannot occur until the question has been presented.

Gentlemen may resort to all the ingenuity of which they are capable, and yet they come back at last to whether or not we shall legislate on appropriation bills. Let us see what we find there. My colleague from Georgia has supposed a case full of dire disaster as he thinks. The gentleman from Maine [Mr. REED] said the extra session, brought about by the unwisdom of the democratic party, was the result of just such legislation. Now, if the country condemns our action, what better conservative force does he want. So far as my colleague's fears are concerned, I undertake to say the time will never come when this Government will perish by the failure to pass appropriation bills. No gentleman here believes it.

My colleague gave an instance from the post-office service. Let me state to him that postmasters of this country, some of them, under an honest administration of the law, were getting salaries of \$200. By a dishonest construction of that law, and by a false return and fraudulent sale of postage-stamps, those salaries were in some instances run up to three or four thousand dollars instead of what the

law prescribed. There has been no legislation on it. When we came to consider the wants of the Government service we inserted legislation which saved on that item alone from eight hundred to nine hundred thousand dollars. And so in reference to railroads. In the Forty-fourth Congress we saved over a million of dollars in compensation to railroads. In the Forty-fifth Congress we saved still further by reducing the pay of railroads for transportation of mails to the extent of a half million of dollars by legislation, under this rule, on appropriation bills. Such items have been running for years and years through the appropriation bills, and I undertake to say that there has not been less than \$100,000,000 saved to the people of this country by this kind of legislation. I hope this House, therefore, will not deny to itself the power that every preceding House of Representatives has possessed since the foundation of the Government. For one, I am willing to trust the representatives of the people.

[Here the hammer fell.]

Mr. TOWNSHEND, of Illinois. I move that the committee rise for the purpose of obtaining an order from the House to close debate upon this clause.

Mr. GARFIELD. Let us take a vote now.

Mr. TOWNSHEND, of Illinois. If the committee will agree to vote now I will withdraw my motion.

The CHAIRMAN. The gentleman from Texas [Mr. MILLS] is on the floor. After he has spoken the Chair will decide that further debate will not be in order.

Mr. HOOKER. Can the Chair decide that until an order is given by the House to close debate?

The CHAIRMAN. The Chair can decide that there cannot be further debate until a vote has been taken upon some one of the amendments.

Mr. TOWNSHEND, of Illinois. I withdraw the motion that the committee rise.

Mr. MILLS. I shall vote most cheerfully for the substitute offered by the gentleman from Georgia, [Mr. SPEER.] I voted in the Forty-fourth Congress, when the party on this side of the House came first into power, for the amendment to the rule which it is now sought to repeal. I have seen some beneficial results from that rule, and I have seen some injurious results from it. I will not now stop to draw a comparison between the good and the bad and sum up the balance of accounts. If it has been a good amendment to the rule, I think it has served out the period of its usefulness, and ought to be repealed.

I have two or three strong objections to that rule. Under the decisions of the Chair anything that is at all akin to the question before the House on an appropriation bill, if it reduces expenditure one farthing, is legitimate to be offered as an amendment. Now, I do not object to the power or privilege which this rule gives to the House of reducing an appropriation, for that is granted in the amendment of the gentleman from Georgia. But the part of the rule that I think is injurious to good legislation is that which authorizes the bringing in of every possible subject and placing it upon appropriation bills. It gives the Committee on Appropriations full sweep over the whole laws of the United States. It breaks down every barrier. It authorizes that committee to dictate every issue that is presented to the people of the United States. It matters not, sir, what may be the public opinion of the United States on any question; it is the party leaders of this House who have the bringing before the House the appropriation bills, and if they desire to thwart that public opinion, they have but to array their party upon this floor upon the question they may choose to make the issue and sound the bugle, and then the party is irrevocably committed to it.

Gentlemen speak of the great victories of retrenchment under this rule, but they fail to tell us where taxation upon the people has been reduced, and that is the very soul of retrenchment. I ask gentlemen to tell me where a farthing of taxation has been reduced under the influence of this rule. The people have been complaining of an unjust system of taxation ever since we have had control of this Government; and our party, when it went into the canvass in 1876, arraigned a system of collecting the customs revenue as one that took from the pockets of the laboring people of this country five dollars for every one that it carried into the Treasury. But gentlemen committed to that doctrine cannot point to one single solitary bill proposing to reduce that taxation which has been brought before the House with any hope of obtaining its passage.

It has been found that upon this single question of retrenchment of expenditures we have a united party, and hence it becomes necessary to save this one plank upon which a united party may stand. At the same time, the section from which I come is to be paraded before the people of the United States every time an appropriation bill is presented to this House, and blows must be dealt upon the heads of the people of that section in connection with the various measures proposed upon appropriation bills. If victory results from this, it is not for their benefit; but if defeat come, every friend withdraws from them, and all the blows fall solitary and alone upon their heads.

[Here the hammer fell.]

Mr. HOOKER rose.

Mr. HAYES. I desire to make a privileged motion. If we are not to get a vote at this time, I move that the committee rise for the purpose of obtaining an order from the House to close debate.

Mr. HOOKER. Can the gentleman make that motion while I am on the floor?

The CHAIRMAN. He cannot while the gentleman from Mississippi is on the floor.

Mr. GARFIELD. Is not debate exhausted on the pending amendments?

The CHAIRMAN. Debate has been exhausted upon the amendment offered by the gentleman from Alabama, [Mr. LOWE,] and also upon the substitute proposed by the gentleman from Georgia, [Mr. SPEER.] But the gentleman from Mississippi [Mr. HOOKER] has been recognized to move to strike out the last word of the substitute. Upon that amendment there may be two speeches, one in support of the amendment and one in reply.

Mr. GARFIELD. Is not that an amendment in the third degree?

Mr. HOOKER. It is not, according to the construction of the rule that has governed the committee heretofore.

The CHAIRMAN. The gentleman from Mississippi moves to amend the substitute—treating the substitute as an independent proposition. His amendment, therefore, is not an amendment in the third degree. The gentleman from Mississippi is entitled to the floor and will proceed.

Mr. HOOKER. In answer to what has fallen from the gentleman from Georgia [Mr. SPEER] in support of the substitute he has offered, and in answer to what has fallen from my friend from Texas, let me say that I think the committee had better possess itself of the rule which has been reported to the House and ascertain in what respect the substitute proposes to change it. I will not weary the committee by reading it. But I will state that the rule as now reported was adopted on the motion of a gentleman from Indiana who stood upon this floor as probably one of the soundest and most practical legislators that ever served the country on either side of this House—I allude to Mr. Holman, of Indiana. He was the author of this amendment as it now stands in the rules as they now are, and as it stands in the rules now reported by this committee. The object and purpose of it was to restrict the abuse which had been made by the republican party of the power to place riders upon appropriation bills; and this amendment offered by Mr. Holman and ingrafted upon the rules of the House in the Forty-fourth Congress, and now reported by the Committee on Rules, requires three conditions before there can be a change of law upon appropriation bills.

There must be three things: primarily there must be a proposition to change existing law; next, the subject-matter must be germane to the bill under consideration; and, thirdly, it must look to the reduction of expenditures. Therefore under the rule as it now exists, and under the rule as reported by the Committee on Rules, so far from the power of the Appropriations Committee being enlarged by the amendment to the rules offered by Mr. Holman, it was restricted and cut down and limited and restrained. That amendment had not for its function or its purpose the enlargement of the power of the Committee on Appropriations. It limited the power from what it had been when the republican party had control, when the power existed of offering any and every proposition by way of amendment. It limited it to the extent that it required the proposition to be germane to the subject matter of the bill and to limit expenditures. To that extent only could any proposition be attached to an appropriation bill changing existing law.

But I am opposed to a change of the rule for a higher consideration than that. It has sometimes been asserted that the power of the House of Representatives as established by our Constitution was not analogous to the power of the English House of Commons over the subject of granting money. I deny that that is a true construction of the power of this House under the Constitution of this country. I would be sorry to vote for any measure or any proposition which should look to the stripping of this House of the right and the power to say that which, under the Constitution, this department of the Government alone can say: when and how and where and under what circumstances money shall be taken from the public Treasury. Any proposition which looks to a reduction of the power of this House, to a restraining of the power of the House, to a limiting of the power of the House over the question of granting the public money, ought never to be adopted by the House whatever party may be in power.

I oppose this amendment and favor the rule as it now stands, because that rule does give to the House the power to say that existing law may be changed by an amendment offered to an appropriation bill, if that amendment be germane to the subject-matter of the bill and tends also to the reduction of expenditures.

This House, under the Constitution and the laws, alone has the power to originate money bills. It is said by gentlemen arguing this question that this House would have the right to put a veto on the action of the Senate and a veto on the Executive. Sir, I admit that is so; and I say with the author quoted by a gentleman on the other side, the great Calhoun, when interpreting this question, that this exercise of the veto power by the one House over the other, and by the Executive over both, only serves to strike another chord in the popular voice, and to bring it out in more full and perfect harmony. [Here the hammer fell.]

Mr. WHITTHORNE. I will detain the committee but a moment or two only. I am in favor of the proposed modification of this rule. I believe it is demanded by the present interests of the country and much more by its future interests. Let us, for a moment, look at this question without regarding it as a partisan question. What

is the object of all rules? It is to secure the intelligent and prompt dispatch of the public business to be brought before a legislative body. What is the necessity for committees of the House? It is to so divide the labors of that body that its work may be brought in before the House in an intelligent shape, as the result of the labors of those committees.

Now, if all the business of the House is to be subject to and controlled by one committee, what necessity is there for dividing that work among the several committees? If the Committee on Appropriations is to determine the character of the legislation to be presented to this House, then why organize committees upon any other subject than that of appropriations?

It is said that this proposition, if adopted, will deny to the representatives of the people the right to withhold appropriations. I ask, is it necessary to have a rider on an appropriation bill in order to get me to withhold my assent from it? If the Army is used to oppress the people of the United States, is it necessary that I should affix a political or legislative rider to the Army appropriation bill? Sir, it is my duty under the Constitution, if I believe the appropriations for the maintenance of the Army are being used illegally, tyrannically, and corruptly, to refuse to vote for the regular Army appropriation bill when it is offered to me for my assent or dissent. A rider on such a bill, therefore, is not necessary.

A word or two now as to this question of riders upon appropriation bills. The experience of every State Legislature is that corruptions of the grossest and basest character make their way into the legislation of the country through the means of appropriation bills and omnibus bills. It is by means of riders that omnibus bills are created, and it is by omnibus bills that more than half of the Legislatures of the States of this country have been corrupted.

In the interest of my country and in the interest of my party, I beg gentlemen to look far into the future, and consider if, when you give to the Appropriations Committee the power to put legislative riders upon appropriation bills, considering the immense growth of individual and corporate interests of this country, it will be long before the corporations of the country through your Appropriations Committee will control and direct the legislative bodies of this country into a ruinous course which will eventually change the character of our institutions.

Let us stand by the old traditions of the legislative fathers of our country. Let us stand by the experience of our State Legislatures in the different States, where constitutions have been amended so as to prevent riders on appropriation bills and to prevent omnibus bills. Sir, let us give each of our legislative bodies and their committees their proper functions.

[Here the hammer fell.]

The question being taken on the *pro forma* amendment of Mr. HOOKER, it was not agreed to.

Mr. GARFIELD. As an amendment to the substitute of the gentleman from Georgia, I offer the following:

But it shall be in order to strike out any sum of money appropriated in a bill and insert a less sum.

I offer this to test the sense of the Committee of the Whole. I offer it, I trust, with no other interest in view than the good of this House, the good of my party, not as a minority, but the good of my party if it should be in the majority—the good, as I believe, of any party whether in the minority or in the majority; for, in my view, it is the interest of every party that we should seal up, so far as we can, the fountain of the bitter waters of strife, and put ourselves in the line of plain, fair, business work, while at the same time we protect the Committee on Appropriations against the assaults which it is liable to receive from all quarters unless some such protection is given to it. I ask a vote on the amendment.

Mr. BLOUNT. I wish to ask the gentleman a question. Would not the effect of his amendment be just this: if the salary, for instance, of a cabinet officer should be reduced on an appropriation bill, without any change of the existing law, would there not simply be a deficiency as to the balance of salary for which we would be bound afterward to appropriate?

Mr. GARFIELD. If a majority of the House and the Senate reduced the appropriation for salary in any appropriation bill, the same majority could go to work and in a separate law make that change operative by legalizing in the form of independent legislation what the judgment of Congress had declared in an appropriation bill.

My own belief is that the officers of this Government ought to be safe for more than twelve months against sudden and unexpected assaults upon their salaries by means of the annual appropriation bills. To change the salaries of public officers, there ought to be required a little more notice than the simple, accidental change of an appropriation in one of the annual appropriation bills.

In conclusion, I will simply say that this amendment saves what the Speaker of this House has said was the main object of the present rule, the reduction of expenditures. Everything else is excluded. It enables us to reduce expenses, but it does not enable us to make the Appropriations Committee the Moab, the wash-pot of the country, in which all the linen of the House is to be tumbled. To prevent this is the object of my amendment, and I believe that if adopted it will execute itself.

Mr. TUCKER. As I understand the amendment of the gentleman

from Ohio, it will authorize in any appropriation bill the insertion of a less sum than the amount authorized by law—

Mr. GARFIELD. Yes, sir.

Mr. TUCKER. But will it authorize the striking out of the whole sum?

Mr. GARFIELD. In striking out you may put in anything you please. You can strike out \$5,000, for instance, and insert zero.

[Here the hammer fell.]

Mr. MCMAHON. Mr. Chairman, I had thought that the whole object of referring an appropriation bill to the Committee of the Whole House was to enable that committee to increase or diminish the amount of appropriations. It seems to me, therefore, a very novel proposition that we shall confer upon the Committee of the Whole the right to diminish the amounts proposed to be appropriated. I understand that the act of appropriation lies in the breast of the Committee of the Whole or of the House; that how much shall be appropriated is always an open question, and does not involve any question of legislation. I understand very well that if in an annual appropriation bill we appropriate, for example, \$3,500 as salary for an officer who under the law is entitled to \$5,000, unless we expressly say "this appropriation shall be in full for salary for the coming fiscal year," a deficiency is created, and a claim against the Government might be enforced in the Court of Claims. A more insidious proposition in the interest of the office-holders of this country was never presented in the House of Representatives than the proposition now pending.

And I say to my young friend from Georgia [Mr. SPEER] that when he starts a new proposition here in the legislation of this House, it ought to make him shake in his boots when he finds the whole republican party ready to stand sponsor in this new baptism. [Laughter.]

Mr. SPEER. I may be young, but I trust I am of the number of those whose follies cease with their youth. [Laughter and applause.]

Mr. MCMAHON. A very good answer, Mr. Chairman; but the trouble is that the whole of the party on the other side of the House applaud the gentleman's present position; and I say that when the republicans of this House unanimously support a proposition offered by a democrat, that man ought to consider, "What have I done to draw down upon me the unanimous applause of the other side of this House?" [Laughter.]

Now, Mr. Chairman, as a member of the Appropriations Committee I want to disavow all desire for the right on the part of that committee to put one word of legislation upon an appropriation bill. But I do want to reserve to the people's representatives in the Committee of the Whole House the right to retrench the expenditures of this Government upon a proper occasion. I do not care that the Committee on Appropriations shall have the power to report one particle of general legislation to this House. I do not want that power. I do not want to be abused for such legislation. I think the Committee on Appropriations has been misled in putting into bills general legislation. But when a democrat comes before this House and says to this Committee of the Whole House, this representative body I see before me here, we shall have no right when we are legislating and passing appropriation bills to say, when we want to, that we shall retrench expenditures, to say that, sir, is for the democratic party to furl at once the flag of retrenchment and reform. It is giving up all we have claimed before the people. It is giving up the standard we raised when we went before the people. And when my young friend considers that view of it, let me say to him, he himself gives up the cause of the party in the next presidential fight. If we strike it out we confess to the people of this country we cannot make the fight in the interest of economy any more.

Now, I want to say to that side of the House their unanimity on a question like this surprises me. I can only accept it as one of those late confessions which always comes to the republican party when it is out of power. When it was in power it was one of the worst which ever had control of this Government. [Laughter on the republican side of the House.] I hope this will not come out of my time.

Mr. ANDERSON. I rise to a point of order.

The CHAIRMAN. The gentleman will state it.

Mr. ANDERSON. I wish to inquire of the gentlemen from Ohio whether in applying the party lash he is acting as a member of the Committee on Appropriations or as a member of the democratic party, or both? When he is exercising the party lash on that side of the House let me suggest that he has no right to whip us on this side.

Mr. MCMAHON. There comes the old appeal—the party lash! the Appropriations Committee! I think the lash must have struck the gentleman himself, as he is the first one to cry out. [Laughter.]

Mr. ANDERSON. Not much.

Mr. MCMAHON. My honored friend from the State of Ohio, when a member of the Committee on Appropriations, never stopped at putting any political legislation on any appropriation bill. Now we have contracted and narrowed the rule. We say any legislation that goes on an appropriation bill must be germane to the subject under consideration.

Mr. GARFIELD. The gentleman will allow me—

Mr. MCMAHON. In one moment. Secondly, that it shall retrench expenditures. Is not that a good rule? Do you want, gentlemen on the other side of the House, to go to the country and say that is not a good rule? [Cries of "Yes!" "Yes!" on the republican side of the

House.] All right, then, put yourself upon the record; but I say to gentlemen on this side of the House, it is not our record and should not be. It is our pride that such is not our record. We know it is your record. We know when you had possession of the Government you spent every dollar you could spend, and you will spend it again when you get possession of this House.

[Here the hammer fell.]

The CHAIRMAN. The question now recurs on the amendment of the gentleman from Ohio [Mr. GARFIELD] to the amendment of the gentleman from Georgia, [Mr. SPEER.]

Mr. TUCKER. I ask the gentleman from Ohio to modify his amendment as I have suggested.

Mr. GARFIELD. I have no objection to saying "or" instead of "and."

The CHAIRMAN. The gentleman can modify his amendment as he pleases.

Mr. TUCKER. That involves striking out or reducing.

Mr. GARFIELD. I will modify my amendment in that way.

Mr. TUCKER. Then it will be in order to strike out any sum of money appropriated in a bill or to insert a less sum.

Mr. RANDALL, (the Speaker.) I wish to state the effect of this. There is a law upon the statute-book directing the appropriation of so much money for a particular subject. You propose in the amendment just read to allow it to be reduced in the appropriation bill.

Mr. GARFIELD. Certainly.

Mr. RANDALL, (the Speaker.) Which is in conflict with the law. Now, if you do that, you should go a step further and give the power to legislate on that appropriation bill to change existing law to the extent of that reduction.

Mr. GARFIELD. I do.

Mr. RANDALL, (the Speaker.) You place the House by your amendment in the attitude of refusing to appropriate as much money as the law authorizes. Then we will have claims for the balance which the law prescribes over the amount appropriated.

Mr. BURROWS. I make the point of order that debate is exhausted.

The CHAIRMAN. Debate is exhausted.

The question recurred on Mr. GARFIELD's amendment to the amendment.

Mr. GARFIELD demanded tellers.

Tellers were ordered; and Mr. GARFIELD and Mr. BLACKBURN were appointed.

The House divided; and the tellers reported—ayes 121, noes 121.

Mr. YOUNG, of Tennessee. I vote "no."

The CHAIRMAN. On this question the tellers report 121 in the affirmative and 122 in the negative. The amendment is rejected. [Applause on the democratic side.]

Mr. GARFIELD. Now, we will try the amendment of the gentleman from Georgia.

A MEMBER. Oh, no; there are several others yet to come.

Mr. HOOKER. Mr. Chairman, I rise to a parliamentary inquiry. Is not the House now brought to a direct vote upon the substitute offered by the gentleman from Georgia, the amendment of the gentleman from Ohio having been voted down?

The CHAIRMAN. The amendment of the gentleman from Ohio having been rejected, it is now in order to offer further amendments.

Mr. HASKELL. I desire to offer an amendment, and my amendment to this substitute is the third clause of this rule as amended by the words I send to the Clerk's desk.

The Clerk read as follows:

Amend the substitute so as to read, after the word "as" in the sixth line, "shall receive a two-thirds vote of the House or Committee of the Whole and."

Mr. HASKELL. Now, the operation of this amendment if adopted will be simply this: It leaves the operation of the rule as it is, giving full power to this House to change existing law in appropriation bills if the amendments are germane and if they tend to retrench expenditures, but it provides that that amendment must be first submitted to the House or the committee and a two-thirds vote secured for its passage. Then it can be attached to the appropriation bill.

This leaves it to the power of the House to control extravagant expenditures. It leaves it to the power of the House in a great emergency to change the existing law on an appropriation bill and simply compels the entire absence of anything like political legislation from the fact that a political amendment could not receive the necessary two-thirds vote. It may be suggested here that we have the motion to suspend the rules, but you cannot do that; for you cannot get the floor to make the motion to suspend the rules for your amendment, however much you may want it if it changes existing law.

Under the operation of this amendment the power of this House is retained, and it simply compels the proposed "rider" or amendment to pass the scrutiny of two-thirds of the House or of the Committee of the Whole. If it does that it is a just and wise bill. If it does that, it is no coercion of the Executive to sign it, because it has been indicated by the vote here that there is a sufficient power in the House to constitutionally override the President's objection. That simple amendment disposes of your political riders, and leaves the majority of the House to pass a really economical subject by simple, wise legislative methods.

I believe if our friends on the other side will adopt this they will

find themselves curtailed in no wise economy, but the only result of it will be to remove political legislation from appropriation bills.

Mr. HOOKER. I hope the amendment will be voted down.

The amendment to the amendment was rejected.

Mr. WARNER. I desire to offer as an amendment to the amendment of the gentleman from Georgia the following.

The Clerk read as follows:

Except that it shall be in order to reduce expenditures provided for by existing laws and covered by the bill, and to that end only to change the law.

Mr. GARFIELD. Change one word and I think we can harmonize. Change the word "expenditures" to "amounts of money."

Mr. BLACKBURN. Oh, no!

Mr. STEVENSON and others. Let the amendment be again read.

Mr. GARFIELD. Do not have it as a means to take in all legislation upon it.

The amendment to the amendment was again read.

Mr. REED. That is worse and more of it.

Mr. RANDALL, (the Speaker.) The amendment had better be read in connection with the other portions of the paragraph.

The CHAIRMAN. The Clerk will report the third clause as it would read if amended by the adoption of the amendment of the gentleman from Ohio, [Mr. WARNER.]

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except that it shall be in order to reduce expenditures provided for by existing law and covered by the bill, and to that end only to change the law.

Mr. GARFIELD. If the gentleman from Ohio wishes to speak on his amendment I desire to say a word in reply. If he does not desire to speak, I wish now to make a remark.

Mr. WARNER. I wish to say but a few words. I cannot myself, Mr. Chairman, consent to any measure which will deprive this House of its control over appropriations. It has cost the people of the Anglo-Saxon race too much to secure to themselves that control, and I for one shall never give a vote knowingly to take away or abridge that right. On the other hand, I concede that to make use of a threat to withhold appropriations from legitimate objects for the purpose of coercing the Senate or a co-ordinate branch of the Government to give assent to a particular measure is inconsistent with our theory of government and wholly unjustifiable. [Applause on the republican side.]

It is a bad precedent set by the republican party, and ought not to be followed. The people of this country do not derive their powers nor their rights nor their liberties from king or president. They are themselves the source of power, and it is in my opinion belittling that power, if not a virtual surrender of this great primary principle of government, to talk about compelling from a President "a redress of grievances." The redress of grievances, as well as the correction of all wrongs, lies with the people themselves.

My object in offering this amendment, therefore, is to save to this House, save to the representatives of the people where that power belongs, absolute control over the question of taxation and the appropriation of money. That is a power that should be carefully preserved to this House to use at any and all times as it may deem best. But at the same time, while we are adopting rules, I would prevent the incorporation of general legislation on appropriation bills. The Appropriations Committee is not charged with the duty of originating and bringing before the House legislative measures. Its duty is to look to appropriations.

The amendment I propose gives to this committee the right and makes it in order in the House to propose to reduce in appropriation bills expenditures required under existing law, and to that extent to change the law, but to go no further than that in the direction of legislation. I think that is as it should be. The amendment offered by the gentleman from Georgia [Mr. SPEER] permits the reduction of expenditures, but not a change in the law. That would leave open the question of a deficiency. This amendment removes all doubt and makes clear, I think, the extent to which legislation can be ingrafted on appropriation bills. I hope the amendment will be adopted.

Mr. GARFIELD rose.

Mr. REAGAN. I desire to offer an amendment.

The CHAIRMAN. The Chair has recognized the gentleman from Ohio, [Mr. GARFIELD.]

Mr. REAGAN. I thought I had obtained the floor.

The CHAIRMAN. The gentleman from Ohio is a member of the Committee on Rules, and in accordance with the practice heretofore has been recognized by the Chair.

Mr. GARFIELD. I am very sure no gentleman here on either side of the House would be willing to deceive any of his associates by a form of words or to do anything in the nature of coming it over another by a trick of speech. That I am sure nobody wants to do.

The only objection that was raised, as I understood, by the Speaker to the amendment that I offered was that it only allowed the reduction of amounts; but it might be it left a deficiency; that it did not change the law as to the reduced amounts. In so far that statement

of the case was right. And here as I understand it we are offered an amendment with the intent just to cover that case. Now, I am willing to vote for an amendment that covers just that case, namely, to say that it shall be in order to reduce the amounts of money required by law and to that extent to change existing law. If this amendment does that I will vote for it; but my friend has got in the word "expenditures" instead of "amounts of money" as I think it should be.

Mr. WARNER. Are not amounts of money to be expended expenditures?

Mr. GARFIELD. Yes; but an expenditure is not always an amount of money. The gentleman proposes the words—

Except that it shall be in order to reduce expenditures provided for by existing law.

Now, I will offer a bill to abolish the present courts of the United States and establish a new judicial system, and in that I will provide that the new courts shall cost \$10 less than the old. Have I not introduced a bill that will reduce the judicial expenditures?

Mr. WARNER. I will accept the gentleman's suggestion and make it "amounts of expenditure."

Mr. GARFIELD. "Amounts of money" is the proper phrase. Let the gentleman and let the House say it shall be in order to change existing law so far as to reduce the actual amounts of money.

Mr. WARNER. I will accept that amendment.

Mr. GARFIELD. If the gentleman will strike out the word "expenditures" and insert "amounts of money provided for by existing law," then I will vote for his amendment.

Mr. WARNER. I will accept that amendment.

Mr. SPEER. I will accept the amendment of the gentleman from Ohio [Mr. WARNER] in lieu of my amendment.

Mr. REAGAN. I rise to offer an amendment to the amendment.

Mr. SPEER. I withdraw my acceptance of the amendment of the gentleman from Ohio.

The CHAIRMAN. Since the gentleman from Georgia withdraws his acceptance of the amendment no further amendment is in order. The question is upon the adoption of the amendment proposed by the gentleman from Ohio, [Mr. WARNER,] as modified, as a substitute for the amendment proposed by the gentleman from Georgia [Mr. SPEER] to the amendment offered by the gentleman from Alabama, [Mr. LOWE.]

The Clerk will read the amendment of the gentleman from Ohio as now modified.

The Clerk read as follows:

Strike out all after the word "except" and insert:

That it shall be in order to reduce the amounts of money provided for by existing law and covered by the bill, and to that end only to change the law.

The CHAIRMAN. It has been suggested that the word "extent" be inserted instead of the word "end."

Mr. WARNER. Who makes that suggestion?

The CHAIRMAN. It has been made by several gentlemen.

Mr. WARNER. I see no objection to that. Let the Clerk make that change.

Mr. BAKER. I would like to hear the amendment as it now stands. The amendment, as modified, was again read.

Mr. WARNER. I ask consent to add the words "on an appropriation bill."

Mr. ROBESON. I would like the gentleman to insert two or three words, so that it will read "to change the effect of existing law."

Mr. WARNER. I would like to know of the gentleman if changing a law is not changing its effect? [Cries of "Vote!" "Vote!"]

The CHAIRMAN. The question is on the amendment of the gentleman from Ohio [Mr. WARNER] as modified.

Mr. WARNER. I ask for tellers.

The CHAIRMAN. If there be no objection tellers will be ordered. There was no objection; and the Chair appointed Mr. BLACKBURN and Mr. WARNER to act as tellers.

The committee divided; and the tellers reported that there were—ayes 124, noes 79.

So the substitute moved by Mr. WARNER for the amendment moved by Mr. SPEER was adopted.

Mr. BLACKBURN. I give notice that I shall call for the yeas and nays in the House.

The CHAIRMAN. The question is on the amendment as amended.

Mr. WARNER. My amendment has been agreed to?

The CHAIRMAN. The particular amendment of the gentleman from Ohio [Mr. WARNER] has been agreed to.

Mr. ROBESON. But that amendment has not yet been adopted as a part of the rules.

Mr. BLACKBURN. I move that the committee now rise.

The motion was agreed to upon a division—ayes 114, noes 34.

So the committee rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that, pursuant to the order of the House, the Committee of the Whole on the State of the Union had had under consideration the proposed revision of the rules reported from the Committee on Rules and had come to no resolution thereon.

Mr. BLACKBURN. I move that the House now adjourn.

The motion was agreed to; and accordingly (at four o'clock and five minutes p. m.) the House adjourned.

FEBRUARY 17, 1880.

REVISION OF THE RULES.

Mr. BLACKBURN. I move that the House resolve itself into Committee of the Whole for the further consideration of the report of the Committee on Rules.

Mr. ATKINS. Before that motion is put I wish to ask the gentleman from Kentucky how much longer he supposes the Committee of the Whole will be engaged in the consideration of this report?

Mr. BLACKBURN. It is impossible for me to answer that question; but I will say I see no reason why this report should not be finally disposed of by to-morrow evening. And in order to hasten action on it, pending the motion that the House resolve itself into Committee of the Whole, I move that all further debate on clause 3, Rule XXI, which is now under consideration, be limited to twenty minutes.

Mr. GARFIELD. That is right.

Mr. ROBINSON. Will that cover all amendments to be offered hereafter?

Mr. BLACKBURN. All amendments to this clause, clause 3 of Rule XXI.

Mr. PAGE. I hope the gentleman will limit the motion to the amendments now before the committee.

Mr. BLACKBURN. I cannot agree to that. Unless we put some limit to the debate it will be simply interminable. We have had six weeks' debate on this report. I am sure the Committee on Rules have taken up no time unnecessarily, but it seems to me a six weeks' debate is enough. I propose there shall be twenty minutes more upon this one clause of this rule and all amendments pending thereto.

The motion to limit debate was agreed to.

The motion that the House resolve itself into Committee of the Whole was agreed to.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, Mr. CARLISLE in the chair.

The CHAIRMAN. The clause under consideration of the Committee of the Whole is clause 3 of Rule XXI, and the pending question is on the amendment of the gentleman from Georgia [Mr. SPEER] as amended by the adoption of the substitute offered by the gentleman from Ohio, [Mr. WARNER.]

Mr. WHITE. Let the pending amendment be read.

The Clerk read Mr. SPEER's amendment, as follows:

Strike out all after the word "order," in line 6 of clause 3, and insert "but it shall be in order to strike out any sum of money in an appropriation bill and insert a less sum."

And Mr. WARNER's substitute therefor, adopted by the Committee of the Whole, as follows:

Except that it shall be in order to reduce the amounts of money provided for by existing law and covered by the bill, and to that extent only to change the law.

So that the clause, if amended by the adoption of Mr. WARNER's substitute, would read:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except that it shall be in order to reduce the amounts of money provided for by existing law and covered by the bill, and to that extent only to change the law.

Mr. FINLEY. As I understand, the substitute offered by the gentleman from Ohio [Mr. WARNER] has been adopted by the Committee.

The CHAIRMAN. It has been agreed to as a substitute for the amendment proposed by the gentleman from Georgia; but the question still remains will the committee agree to this as a substitute for that part of the report.

Mr. SPEER. I wish to say that I hope the substitute will be adopted.

The CHAIRMAN. The question is not debatable. The question is on the adoption of the amendment as amended.

Mr. PAGE. I desire to enter my protest—

The CHAIRMAN. Debate has been exhausted on the pending amendment.

Mr. PAGE. I move to strike out the last word.

Mr. BLACKBURN. Any debate now will be under the operation of the order limiting debate.

The CHAIRMAN. By order of the House all debate on this paragraph and any amendments thereto is limited to twenty minutes.

Mr. PAGE. I desire to offer my protest against the adoption of the amendment of the gentleman from Ohio [Mr. WARNER] which has been adopted as a substitute for the amendment of the gentleman from Georgia, [Mr. SPEER.] In my judgment the rule if adopted in that form will be worse than the twenty-first rule as it now stands. I believe that under the operation of this rule, should it be adopted, it would be in order to strike out the appropriation for the Army of the United States or to reduce it to a certain amount, and thereby the law might be changed to correspond with such reduction.

Now, it has been decided by the gentleman who at present occupies the chair that unless a proposition showed upon its face that it did reduce expenditures it was not in order upon an appropriation bill.

It was decided by a former Speaker of this House, Hon. Mr. Kerr,

of Indiana, that unless a provision reported in an appropriation bill, or presented as an amendment thereto, should show upon its face a reduction of expenditures, it was not in order upon an appropriation bill. The pending proposition, upon which the committee is now called to vote, if adopted, would make it absolute that an amendment reducing the amount of money provided for by law would be in order, and the law could be so amended as to correspond with that reduced amount of money appropriated. That would render certain what has been ruled by but one presiding officer, the gentleman from Kentucky [Mr. BLACKBURN] who now has charge of the report of the Committee on Rules. He is the only chairman of the Committee of the Whole of this House, so far as I know, who has decided contrary to three prior decisions by occupants of the chair.

The first of those decisions was made by the Speaker of this House on an amendment to a bill proposing to transfer the control of the Indian Bureau from the Interior Department to the War Department. That matter was thoroughly discussed in this House, and upon a point of order Hon. M. C. Kerr ruled the proposition out of order. In the Forty-fourth Congress the gentleman from Illinois, [Mr. SPRINGER,] while acting as chairman of the Committee of the Whole, ruled out a similar proposition on the appropriation bill; and the gentleman from Illinois, Mr. Eden, ruled on a proposition submitted by my colleague at that time, Mr. Wigginton, to abolish the offices of surveyors-general in the States and Territories, that the amendment was not in order, as it did not show upon its face that it would work a retrenchment of expenditures. And the present occupant of the chair, the gentleman from Kentucky, [Mr. CARLISLE,] in the Forty-fourth Congress made a similar ruling.

But in the last Congress the gentleman from Kentucky [Mr. BLACKBURN] reversed these rulings and did admit a proposition that provided for the abolition of the offices of surveyors-general in the different States and Territories, and which would have worked a thorough change in existing laws in reference to the public lands. That proposition was offered as an amendment to an appropriation bill, and the gentleman from Kentucky [Mr. BLACKBURN] ruled it in order.

With that exception it has been universally held under the present rule that no amendment of that kind was in order. Under the proposed change, now pending before the Committee of the Whole, the amendment, if adopted, will make absolute the rule that an amount of money provided by existing law may be changed to a less sum, and to that extent the law may be changed so as to conform to the reduced sum of money appropriated.

I am opposed to that, and I hope the Committee of the Whole will vote down the proposition of the gentleman from Georgia, [Mr. SPEER,] as amended by the adoption of the substitute offered by the gentleman from Ohio, [Mr. WARNER.] I infinitely prefer the present rule, with a fair construction of the rule, such as we have had on different occasions. I believe the minority of this House will be safer with the rules as they now stand than they would be with the amendment proposed by the gentleman from Ohio, [Mr. WARNER,] and therefore I hope that the amendment will be voted down.

Mr. BLACKBURN. I do not think the record will bear out the statement made by the gentleman from California, [Mr. PAGE,] who seems, instead of rising to discuss the amendment or the clause pending, to be actuated rather by a desire to indulge in a piece of criticism upon some ruling that I may chance to have made while occupying the chair. I do not believe the record will bear out the construction the gentleman gives to that ruling; I do not believe any such singularity of ruling will appear.

I certainly do not mean to reflect upon any ruling which may have been made by the Speaker of this House, by the present occupant of the chair, or by the gentleman from Illinois, [Mr. SPRINGER,] as they have been referred to. I simply desire to say that if at any time in the past I have made a ruling, or shall at any time in the future be fortunate enough to make one, which incurs the criticism of the parliamentarian from California, it will only strengthen my conviction of having been right in that ruling.

The question was taken upon the amendment of Mr. SPEER, as amended by the adoption of the substitute offered by Mr. WARNER; and upon a division there were—ayes 32, noes 80.

No further count being called for, the amendment, as amended, was not agreed to.

Mr. PRICE. Is an amendment now in order?

The CHAIRMAN. The Chair will hear the amendment and then decide.

Mr. PRICE. I move to add to clause 3 of Rule II that which I send to the Clerk's desk.

The Clerk read as follows:

Which retrenchment shall not be by inference, but shall in express terms specify on its face the amount of money to be saved by the amendment.

The CHAIRMAN. That amendment would be in order as a substitute for the amendment proposed by the gentleman from Alabama, [Mr. LOWE,] which is now pending. The Clerk will read the amendment proposed by the gentleman from Alabama.

The Clerk read the amendment of Mr. LOWE, which was to add to clause 3 the following:

Provided, however, That no provision or amendment of a partisan character shall be in order.

The CHAIRMAN. The amendment of the gentleman from Iowa

[Mr. PRICE] would be in order as a substitute for the amendment of the gentleman from Alabama, [Mr. LOWE.]

Mr. PRICE. I will move it as a substitute for that amendment, and ask that the Clerk read the third clause as it will be if the amendment which I have offered shall be adopted.

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures, which retrenchment shall not be by inference, but shall in express terms specify on its face the amount of money to be saved by the amendment.

Mr. PRICE. The only object I have in offering that amendment is this: in the discussions upon this very point, whether the amendment was germane and whether it did retrench expenditures, the occupants of the chair at different times have decided differently. On the one side it would be alleged that such an amendment would decrease expenditures; and on the other side it would be affirmed that the amendment would not reduce expenditures.

My object in offering this amendment is simply to fix the matter definitely so far as this point is concerned, so that in every case and under all circumstances an amendment, to come within the rule, shall specify on its face, not by inference but in express terms, that expenditures are reduced and shall state the amount of the reduction.

Mr. FRYE. I wish to say but a single word. It was generally understood that the Committee on Rules were to meet for the consideration of this question, and that very likely they might agree upon something to take the place of these very amendments which have been proposed. I simply wish to say that the committee met last night, and adjourned at eleven o'clock without agreeing upon anything to take the place of Rule XXI; and they cannot agree.

Now, as only twenty minutes are allowed for debate, I desire to say that hereafter when there will be no opportunity for discussion, an amendment may be offered providing in effect that nothing shall be in order as an amendment on an appropriations bill unless it shall have been reported by a committee of this House. Now, I warn gentlemen of the House that this would be infinitely worse than the rule as it stands at present, because under that rule without any amendment we have only fifteen men who can set their busy brains at work to invent some sort of a political "rider" to put on an appropriation bill. But if such an amendment as I have indicated be adopted, authorizing every committee of this House to report amendments and providing that these amendments shall be in order, you simply declare that not fifteen merely, but every committeeman on the democratic side of this House, so long as the democratic party are in the majority here, may set his busy brain at work getting up some sort of "riders" for appropriation bills. If such a proposition is made, I trust it will be promptly voted down.

Mr. SPEER. I desire to offer an amendment.

The CHAIRMAN. No amendment would be in order at present, a two amendments are pending.

Mr. GARFIELD. I wish to say a single word on the pending amendment in reply to the gentleman from Iowa, [Mr. PRICE.] The object of that gentleman is manifestly good; but the language of his amendment makes it of no consequence whatever as an effective machine for preventing "riders." Under such a provision I can offer an amendment to the Army appropriation bill reorganizing the Army of the United States throughout, and can say in words as a part of my amendment that the clause thus added shall reduce the cost of supporting the Army \$1,000. I can say in the amendment, "for the purpose of reducing the cost of supporting the Army \$1,000, which is hereby done, the following shall be a part of the law." Thus my amendment reorganizing the whole Army or any other department of the service complies technically with the terms of the rule.

Now, in my judgment, we are in an attitude where one of three results must happen: either the rule must stand as now, with all its bad consequences; or the amendment of the gentleman from Georgia, [Mr. SPEER,] which mitigates largely the evil of the existing rule, will be adopted; or some middle proposition, like that of my colleague, [Mr. WARNER,] will be adopted, which, contrary to the opinion of my friend from California, [Mr. PAGE,] does, as I think, largely cut down the power of "riders," although not as much as many of us desire. I hope that under the present circumstances we shall get one good, fair chance to vote off altogether that clause of the rule which allows any change of existing law on an appropriation bill. That is the fair, plain, clear reparation of all difficulty. If we cannot do that, then the proposition of the gentleman from Georgia is the next best thing, and I hope we shall stick by it.

Mr. BLOUNT. It is the same thing.

Mr. SPEER. I wish to make a parliamentary inquiry.

The CHAIRMAN. The gentleman will state it.

Mr. SPEER. What is the condition of the amendment I submitted?

The CHAIRMAN. It has been disposed of by the Committee of the Whole.

Mr. SPEER. So I understood, and therefore I desired to offer another amendment.

Mr. HURD. Mr. Chairman, I had not intended to take any part in this discussion until the amendment was proposed by my colleague [Mr. WARNER] to the proposition of the gentleman from Georgia,

[Mr. SPEER]. The propositions, both of my colleague and the gentleman from Georgia, are full of danger. To ascertain the danger we must understand the legal situation upon which these propositions operate. This House is not now engaged in legislation, but in determining the rules which shall govern the proceedings incident to legislation. In doing this the House can undoubtedly regulate the methods to be pursued in the exercise of the other powers conferred upon it in the Constitution, but it cannot impair or destroy those powers.

The House originates appropriation bills or bills of revenue. The propositions of my colleague and of the gentleman from Georgia operate upon them. They declare, in substance, that no general nor political legislation shall be attached to appropriation bills.

This would do if both Houses could originate bills of revenue; but the Constitution expressly declares that this power shall be exercised by the House of Representatives only. What does this mean? History incontestably demonstrates that this provision was inserted in the Constitution to give to the immediate representatives of the people the control of appropriations, to enable them to restrain executive authority, to secure redress of grievances, and to bring about the adoption of salutary measures of legislation. It was designed to authorize the House to say to the President that unless there was redress of the grievances of which it complained in a particular Department of the executive branch of the Government there should be no appropriation for such Department.

Such has been the use of a similar provision in the English constitution. For such uses has it been employed, I venture to say, by every House of Representatives of the Congress since the adoption of the Federal Constitution. Without such power resulting to the House, the language of the Constitution in this respect is meaningless. But such uses are impossible if general legislation be prohibited upon appropriation bills. The executive authority might approve the appropriation bill and veto the general legislation which contained the redress of grievances if they were presented to him separately. This, indeed, would always be the case when there was a dispute between the executive and legislative branches of government.

To adopt, therefore, the amendments of my colleague and the gentleman from Georgia is to surrender the power the Constitution gives, to abdicate the authority the House possesses to originate bills of revenue exclusively, and this, too, with the unlimited power of amendment of the House bills in the Senate. The propositions, therefore, not only destroy the power of the House to secure redress of grievances through appropriations, but practically make it an exclusive power of the Senate. All this I admit may be done by a constitutional amendment only, as has been already done by the many States to which the gentleman from Connecticut [Mr. HAWLEY] referred the other day. I deny that this result can be accomplished by the adoption of a mere rule, intended only for the regulation of the proceedings of the House.

But even if the power to redress grievances through appropriation bills might be taken away by a rule, it seems to me it would be unmanly in any House, under any circumstances, at any time, to so surrender it. It would be a confession that the majority was afraid to legislate, an admission of its own inability to meet questions as they arise, and a proclamation of its own inefficiency. It would be a voluntary binding of its own hands. It would be shrinking from the responsibilities of legislation which each member assumes when he accepts the certificate of his election and the majority assumes when it organizes the House.

But how utterly inexcusable it would be for the House of Representatives in this Congress in the present exigency to surrender this power! In the extra session we entered into a contest which we knew would be protracted. The power we assailed was entrenched behind past legislation and present executive authority. We knew that we could not win in a day. Thus far in the contest we have learned the value of our power to control the purse. Through it, and through it only, we have won impartial juries and shorn the Army of much of its dangerous power. And now in the midst of the conflict it is proposed to abandon the power which has given us the partial victory. Astounding proposition! Surrender of the colors in the face of the foe, abandonment of the vantage-ground in the heat of the fight, these are offenses rarely excused in military warfare. They are absolutely without justification here when we are engaged in a contest for the liberties of the people, when their voices are temporarily silent except as we utter them, and when we have their colors in our hands at our own solicitation.

For one, I insist that the democratic majority of this House shall stand impregnable upon the Constitution; that it shall exercise every power that instrument has conferred for the people; and that least of all and last of all shall it abate one jot or tittle of its authority over the purse until every vestige of military power shall have disappeared from the peaceful States of this Union. [Applause.]

[Here the hammer fell.]

Mr. WARNER obtained the floor.

The CHAIRMAN. The Chair will remind the gentleman from Ohio [Mr. WARNER] that of the twenty minutes allowed by the House for debate on this proposition only two minutes remain.

Mr. WARNER. I regret that I have not more time; I hope my time may be extended.

I wish to say, Mr. Chairman, that I repudiate as undemocratic the

doctrine that this House may rightly withhold appropriations from legitimate objects, necessary to the support of the Government, as a means of coercing the Senate or the executive branch of the Government.

Mr. FINLEY. I wish to ask the gentleman how he voted at the extra session on riders on appropriations. Did he not vote in favor of putting them on?

Mr. WARNER. I would vote again to reduce or, if need be, to shut off entirely an appropriation from a specific object for which I thought the appropriation ought to be reduced or stopped altogether, and to that end to change the law. That is a right this House clearly has, and I am the last member that would surrender that right. But to stop appropriations from objects about which there is no contention, as a means to compel compliance with some measure about which the majority of this House and the Senate or the Executive may differ, is quite a different proposition. Individual members may have so held and voted at the extra session, but the democratic party held to no such doctrine. It refused to take that position, and for one I will not be committed to it now.

The doctrine that we are to look to the Executive for a redress of grievances is utterly foreign to our system of Government. It was the old doctrine five hundred years ago or a hundred years ago that all powers of government were inborn in the king; and consequently when our forefathers got King John in a tight place they compelled him to give up some of his rights and vest them in the people, or rather, in certain great barons. In England it is true the people have said to the king time and again, "We will not let you have money; we will not levy taxes or give you revenues unless you will surrender to us some of the powers of government inherited by divine right, at least unless you will yield to us some privileges or secure to us some liberties." And this is consistent with the theory of the divine right of kings. But how utterly different our theory of government. With us government derives all its powers from the consent of the governed.

The President of the United States never possessed power not derived from the people, and I do not propose, myself, to recognize any other doctrine. All power in this country originates with the people. The Executive has no power, any more than this House has, except that which the people have given to him, and it is absurd to talk about compelling a redress of our grievances from that official. The people redress their own grievances in this country; and the President is as much responsible to the people as is the House of Representatives or Congress.

[Here the hammer fell.]

Mr. SPEER. I desire to offer the following as a substitute for the amendment of the gentleman from Alabama [Mr. LOWE] as sought to be amended by the gentleman from Iowa, [Mr. PRICE:]

But it shall be in order to strike out an amount of money appropriated in a bill and insert a less amount.

Mr. BLOUNT. I submit that this proposition is substantially the same thing that we have already voted on.

Mr. SPEER. It differs from the amendment heretofore offered.

Mr. BLOUNT. I submit that it is substantially the same.

Mr. GARFIELD. It is not identical.

Mr. BLOUNT. It is substantially so.

Mr. SPEER. The phraseology is different.

Mr. BLOUNT. But the idea is the same.

The CHAIRMAN. According to the present recollection of the Chair, this is the identical amendment proposed by the gentleman from Ohio and rejected in the committee when this question was last up.

Mr. GARFIELD. The Chair is mistaken. I said "sum of money," This is "amount of money," and markedly different.

Mr. TOWNSHEND, of Illinois. It is a difference without a distinction.

The CHAIRMAN. Will the gentleman from Ohio state that in his opinion this means anything different from the one he offered?

Mr. GARFIELD. That is for the House to judge. One is different; it is not identical, and that is what the rule turns on.

Mr. BLOUNT. I submit it to the Chair, and I do not think the Chair will have any difficulty in deciding it.

The CHAIRMAN. The Chair dislikes to pass upon the mere definition or significations of words when the committee is equally competent to do so. But it seems to the Chair this is identical—

Mr. GARFIELD. The rule is very clear that an identical proposition that has been voted down cannot be offered; but nothing is more common here in practice in the House than to strike out an unimportant word or make an unimportant change, and then it is in order.

Mr. BLACKBURN. Where does the gentleman find the word "identical" inserted in the rule?

Mr. GARFIELD. What is that?

Mr. BLACKBURN. I ask the gentleman from Ohio where he finds in any rule it must be identically the same proposition?

Mr. GARFIELD. I say the rule is so.

Mr. BLACKBURN. And I say there is no such word in the rule.

Mr. GARFIELD. A proposition consists of words, and if the words are the same it is the same proposition.

Mr. BLACKBURN. There is no such thing in the rules.

Mr. GARFIELD. And if it is not the same proposition it is in order.

Mr. REED. A proposition may be sometimes decided by the conclusion to which it would arrive if carried out. Now, if the proposition on the other side is carried out to its conclusion—

Mr. TOWNSHEND, of Illinois. I object to this debate if it is not in order, and it is not in order in my judgment, as we have already closed debate.

The CHAIRMAN. The Chair desires to hear gentlemen on this question of order.

Mr. REED. If the proposition on the other side is carried out to its legitimate conclusion it would make the Chairman the interpreter of the meaning of amendments, and that assuredly cannot be the object of any rule of this House. If the language is different, it is for the House to determine whether the meaning is the same or not, not for the Chairman. I submit there is no other rule consistent with proper deliberation on the part of an assembly like this.

Mr. BLACKBURN. I rise to a parliamentary inquiry.

The CHAIRMAN. The gentleman will state it.

Mr. BLACKBURN. Has the Chair ruled on the point of order raised by the gentleman from Georgia?

The CHAIRMAN. The Chair has intimated what his impression is, but has not made a final decision. The gentleman from Georgia, who offered the amendment, desires to be heard on it, and the Chair will hear him.

Mr. SPEER. It seems to me there is a difference in the amendment I offer from the one disposed of by the committee. The one which was disposed of is this: "But shall be in order to strike out any sum of money in an appropriation bill and insert a less sum." That was "sum of money in an appropriation bill." This is, "But it shall be in order to strike out an amount of money appropriated in a bill."

The CHAIRMAN. What is the difference between "a sum of money" and an "amount of money?"

Mr. SPEER. Of course, it is the same thing, but it is not the same proposition.

Mr. BLACKBURN. Precisely the same.

Mr. SPEER. I submit it is for the House to say whether it is the same proposition.

The CHAIRMAN. Of course it is for the House or the committee, as the case may be, in every instance to revise the ruling of the Chair.

Mr. GARFIELD. Will the Chair let me make a suggestion as to a very decided matter of substance of difference in these two propositions?

The CHAIRMAN. The Chair would like to hear the gentleman.

Mr. RANDALL, (the Speaker.) If the gentleman is to debate the proposition, I should like to have a minute.

Mr. GARFIELD. I am not going to debate the merits at all. One of these propositions relates to an appropriation bill as such, namely, any one of the twelve regular bills, and the other relates to any appropriation in any bill. One of them, therefore, applies to all bills, whatever their character, containing an appropriation, and the other is confined to the twelve appropriation bills. If the Chair will observe, they are substantially different propositions as well—

Mr. ATKINS. There are more than twelve appropriation bills. Sometimes we have half a dozen deficiency bills, and those are appropriation bills also.

Mr. BLACKBURN. I rise to a parliamentary inquiry. What effect had the order of the House limiting all debate upon the third clause of this twenty-first rule and all the amendments thereto to twenty minutes?

The CHAIRMAN. That relates to debate on the merits; but the Chair will hear discussion on the point of order. The Chair has listened to this discussion, as he is reluctant to take upon himself the authority of depriving the committee of the right to pass upon amendments; but the Chair is wholly unable to perceive any difference whatever between the words "amount of money" and "sum of money" in this connection. And as to the last point made by the gentleman from Ohio, this rule which is under consideration relates to general appropriation bills and to none other; and if this amendment were ingrafted, it would still refer only to the general appropriation bills. The Chair decides that the point of order is well taken, and hopes that any gentleman who excepts to the ruling will take an appeal from the decision of the Chair to the committee.

Mr. GARFIELD. With the utmost respect to the presiding officer I appeal from that decision.

The CHAIRMAN. The gentleman from Ohio takes an appeal from the decision of the Chair, and the question before the committee is, Shall the decision of the Chair stand as the judgment of the committee? The Chair would prefer to have a division of the House on this question.

Mr. GARFIELD. Very well; I demand tellers.

Tellers were ordered; and Mr. GARFIELD and Mr. BLACKBURN were appointed.

The House divided; and the tellers reported—ayes 129, noes 100.

So the decision of the Chair was sustained.

Mr. SPEER. I move the following amendment.

The Clerk read as follows:

But it shall be in order to strike out an amount of money appropriated in any bill for any purpose, passed or pending, and insert a less amount.

Mr. BLACKBURN. I make the same point of order on that amendment.

Mr. BLOUNT. And besides it is not germane.

Mr. BLACKBURN. It is not germane. It is substantially the same proposition.

Mr. BLOUNT. That does not relate to appropriation bills.

Mr. SPEER. It does not allude to appropriation bills. It alludes to any bill before the House making appropriations.

The CHAIRMAN. Debate is not in order.

Mr. SPEER. This does not refer to appropriation bills only.

Mr. RANDALL, (the Speaker.) Then it is not germane.

Mr. SPEER. But it refers to any bill before the House appropriating money. I offer that substitute now, and I think it is in order. It is substantially different from the amendment disposed of by the committee.

Mr. BLACKBURN. I will not go on extending the time of discussion at all. I will put the gentleman from Georgia on his candor, and ask him whether it is not substantially the same amendment disposed of by this Committee of the Whole once, and ruled out of order by the chairman a second time, and the action of the Chair in that matter sustained by the committee?

In the first place, the point of order is made against the amendment of the gentleman because it is not germane to the subject that is embraced in this clause of the rule. In the second place, the point of order is made it is not in order because it is (and no one will undertake to deny it) substantially and identically the amendment which has been once already disposed of by this committee, and a second time offered and ruled out by the Chair, and that ruling sustained by a very decided majority of the committee.

Mr. REED. Mr. Chairman, I think it is a very fair index of the confusion of mind prevailing on this subject that the gentleman from Kentucky should speak of a "substantially identical amendment." I congratulate the House on having decided that striking out a word and inserting another is not an amendment, but I certainly hope they will not go to the extent of saying that striking out a half a dozen words and inserting others is not an amendment.

Mr. BLACKBURN. I do not see anything in that to reply to. [Laughter.]

Mr. HASKELL. The gentleman from Kentucky says it is substantially the same amendment as the other, but there is no such language in the rule which compels the chairman to rule out another amendment which is substantially the same.

Mr. BLACKBURN. I do not wish to compel the chairman to do anything.

Mr. HASKELL. But I desire to call the attention of the gentleman from Kentucky to this fact, that it has been the practice from time immemorial when a sum of money, say, for instance, \$10,000 is named in a bill, for a gentleman to rise and move to amend it by making it \$9,999.99. There never was a legislative body on earth or a parliamentary law promulgated by any man which would not compel the recognition of that proposition as an amendment which would be in order, and yet it is substantially the same thing.

Now, here is an amendment differing in the construction of it even. Here is an amendment using entirely different words, and by what rule of parliamentary law is the Speaker of this House or the chairman of this committee to make himself a dictionary for the House? Does the rule say that it shall be substantially the same in order to rule it out? It says practically it shall not be the original one. Here is an amendment with five new words it. Who is to judge of the interpretation of those words? Who is to be the dictionary for the House of Representatives? Is it the Speaker or the chairman of the Committee of the Whole that is to determine the difference in the legal effect of the words employed in an amendment?

I ask the gentleman from Kentucky if the statement I have made is not true, that where the sum of \$100 occurs in a bill, and \$99.99 is moved as an amendment, such an amendment is constantly entertained? The gentleman has only to let his mind run back over his long legislative experience to call up dozens of instances where these slight and immaterial amendments have been ruled to be in order.

Mr. BLACKBURN. I do not see half a cent's difference between these two. [Laughter.]

Mr. FRYE. I desire to say but a word. I call the attention of the Chair to the proposition made by the gentleman from Kentucky. That gentleman says this is almost the identical amendment offered before. He says it ought not to be allowed; first, because it is not germane to the subject-matter; and, second, because it is identically the same amendment. Now, nobody claims that the other amendment was not germane. The gentleman objected to it, but did not use the word "germane" at all in reference to it. The Chair recognized the other amendment as germane. The gentleman from Kentucky knows the other amendment was germane. And yet he has discovered such a difference between that amendment and this, which he says are identical, that this amendment is not germane.

Mr. BLACKBURN. I do not intend to enter into any dispute with my colleagues on the Committee on Rules. The gentleman from Maine knows very well that he is straying away from the fold in what he is doing now. But I wish to ask, does he not know the other amendment did not apply to all bills, but simply to appropriation bills?

Mr. FRYE. Yes; and therefore it is not the same amendment.

Mr. BLACKBURN. Does the gentleman not know that this amendment in being made to apply to all bills is not germane to the clause on which it is sought to ingraft it? I put the gentleman on his can-

dor, and ask him if he was in the chair would he not rule this amendment out of order as not being germane to the pending clause?

Mr. FRYE. What I would do if in the chair I do not know.

Mr. BLACKBURN. I do.

Mr. FRYE. But I do know this, that if I was chairman of the committee from whose fold I am wandering, I would not insist, first, that the amendment is not in order, because it is the identical amendment offered before; and, second, that it is not germane because it is not the identical amendment.

Mr. BLACKBURN. I do not propose to argue the matter any further. I simply mean, in one sentence, to restate the objection I made in submitting the point of order. The amendment offered by the gentleman from Georgia [Mr. SPEER] is amenable to the criticism passed upon it in that it is not germane to this clause of the rule; and, in the second place, it is amenable to the criticism passed upon it for the reason that any part of it that is germane, or that could possibly be admitted as germane as an amendment to this clause of this rule, has already been passed upon, not once but twice, by the committee.

Mr. GARFIELD. I desire to say a single word, in the first place, on the question of germaneness raised by my friend from Kentucky. What is this rule we are acting upon to which he says the amendment is not germane? It is Rule XXI, entitled "On bills"—bills before the House of Representatives for action. The first and second clauses of this rule treat of certain features of bills. The third section is as to appropriation bills. The term "general appropriation bill" is used. But with a House of Representatives so addicted to retrenchment as this, if they object to applying the restrictions of this rule to any bills that have appropriations in them just because they are not general appropriation bills, they are making an exceedingly fine sight, in order to rule out this amendment on the point of germaneness.

In the next place, as to the identity of these propositions, the distinguished chairman of the committee seems to have ruled, and the gentlemen on the other side seem to have supported his ruling, that this House has no business to be consulted on a matter of style. I had supposed that, even if I approved the substance of a proposition, I had a right to rise and amend it in regard to its style or to suggest something about the grammar, something about rhetoric, something about words of many syllables or words of few syllables; and my friend from Georgia has now introduced a proposition that has at least five words different from the words of the other amendment. It may be with him a matter of style. I shall be sorry if Georgia cannot be permitted to have a voice on the floor of this House on a matter of style. This is one of the State rights I will defend. I have sometimes myself moved to strike out the last word, and I have known half a dozen other gentlemen move to strike out the same last word, and we have known that proposition to be voted on; but all at once an appeal is made to party discipline to prevent us from even correcting the style of an amendment. I think my distinguished friend in the chair will, on reflection, not rule that a change so important as that of five whole words is one which the gentleman from Georgia has not a right in his place as a member of the House to offer in the form of an amendment; and if we are acting on appropriations, then let us act on all appropriations, whether they be in any one of the twelve appropriation bills or any one of the two thousand other bills that appropriate money.

Mr. BLACKBURN. Will the gentleman allow me—

Mr. GARFIELD. Certainly. I am always ready to allow the gentleman almost anything he wants.

Mr. BLACKBURN. In order to make the gentleman's defense of the amendment now pending absolute and complete, will he allow me to read what he himself, as a member of the Committee on Rules, has very recently said in a unanimous report made accompanying this proposed revision of the rules?

Mr. GARFIELD. I think I remember it.

Mr. BLACKBURN. I will read it, with the gentleman's permission.

Mr. GARFIELD. I think it will be very good reading.

Mr. BLACKBURN. Here it is:

Under the present rule "a bill or resolution pending before the House" may be moved as an amendment to a pending proposition, if germane, by simply changing a word or two in no sense important or material, thereby accomplishing indirectly what the rules prohibit doing directly, a species of parliamentary legerdemain that certainly ought not to be countenanced or permitted by a rule.

[Great laughter and applause.]

Mr. GARFIELD. That is very good; but in the pending amendment there is a change of five words, which is more than "parliamentary legerdemain."

Mr. ROBESON. Will the gentleman from Kentucky [Mr. BLACKBURN] allow me a moment?

Mr. BLACKBURN. Certainly I will.

Mr. ROBESON. Are we not now acting under the rule which you say in your report permits that very thing?

Mr. BLACKBURN. We are.

Mr. ROBESON. Then is not this the same as that which the gentleman admits is in order under the present rule?

Mr. BLACKBURN. By no means, for it is not a word or two; but, according to the statement of the gentleman from Georgia [Mr. SPEER] offering the amendment, it is either five or six words.

Mr. ROBESON. Will the gentleman permit me a minute?

Mr. BLACKBURN. Certainly.

Mr. ROBESON. I desire only to ask the gentleman whether that

is not the fault which the Committee on Rules finds with the present rules, and whether it is not conclusive that we have the right to make such an amendment as the rules now stand under which we are acting?

Mr. BLACKBURN. That would be the risk under the present rules, but not to the extent that this amendment goes.

The CHAIRMAN. The Chair thinks there is not very much difficulty about this question. The third clause of Rule XXI, as reported by the Committee on Rules, relates as it now stands to general appropriation bills alone. The amendments which have been offered heretofore, the one voted upon by the committee as well as the one which the Chair ruled out of order, did not propose to change the rule in that respect. But the amendment now sent up proposes to extend this provision to all bills which may appropriate money, and therefore in the opinion of the Chair it is quite different from the one heretofore offered and voted down, as well as the one offered and ruled out by the Chair.

Nor does the Chair think that he can rule this amendment out of order upon the ground that it is not germane to the particular clause under consideration. It is for the Committee of the Whole to say in what part of the reported revision of the rules it will insert any particular provision. The Chair can only rule a proposition out of order when in his opinion it is not germane to any part of the report of the Committee on Rules, or to any part of the subject-matter before the Committee of the Whole. The Chair therefore overrules the point of order and admits the amendment.

Mr. RANDALL, (the Speaker.) Is any debate allowable on this amendment?

The CHAIRMAN. The twenty minutes' time allowed by the House for debate on this clause and amendments thereto has expired.

Mr. RANDALL, (the Speaker.) I would like to have said a word. I wanted to say if I may be allowed to do so— [Cries of "No!" "No!" on the republican side, and laughter.]

The CHAIRMAN. The amendment proposed by the gentleman from Georgia [Mr. SPEER] will be read.

The Clerk read as follows:

But it shall be in order to strike out an amount of money appropriated in any bill, for any purpose past or pending, and insert a less sum.

Mr. WARNER. I rise to make a parliamentary inquiry. Not having given particular attention— [Cries of "Vote!" "Vote!"]

Mr. WARNER. I want to make a parliamentary inquiry, and I propose to make it.

The CHAIRMAN. Debate is not in order. [Renewed cries of "Vote!" "Vote!"]

Mr. WARNER. I do not propose to debate; I desire to inquire if an amendment to the amendment is in order?

The CHAIRMAN. Not at this time. The amendment proposed by the gentleman from Georgia [Mr. SPEER] is a substitute for the one proposed by the gentleman from Iowa, [Mr. PRICE.]

Mr. REED. Does that propose to strike out all of the third clause after the word "order?"

The CHAIRMAN. The proposition is to strike out all after the word "order," where it occurs in the last sentence of the third clause of Rule XXI, and insert what has been read by the Clerk. The question is upon the amendment of the gentleman from Georgia.

Mr. GARFIELD. Let us have tellers; we might as well have them first as last.

The CHAIRMAN. If there be no objection tellers will be ordered. There was no objection, and Mr. SPEER and Mr. BLACKBURN were appointed as tellers.

The committee divided; and the tellers reported that there were— yeas 120, noes 121.

So the amendment of Mr. SPEER was not agreed to. [Applause on the democratic side.]

Mr. ROBESON. I send to the desk an amendment which I desire to offer as a substitute for the amendment of the gentleman from Iowa, [Mr. PRICE.]

The Clerk read as follows:

Strike out all after the word "order," in the next to the last line of the third clause of the twenty-first rule; so that the last sentence of the clause will read: "Nor shall any provision in any such bill or amendment thereto, changing existing law, be in order."

The CHAIRMAN. This is an amendment to the text, not to the substitute now pending. It can be considered after the pending questions are disposed of.

Mr. ROBESON. I desire to offer it whenever it may be in order.

Mr. WHITE. I offer the following as a substitute for the amendment of the gentleman from Iowa, [Mr. PRICE:]

Strike out all after the word "order" and insert:
The general appropriation bills shall embrace nothing but appropriations for the ordinary expenses of the different departments of the Government.

The CHAIRMAN was about to put the question on the amendment of Mr. WHITE, when

Mr. WHITE called for tellers.

Tellers were ordered; and Mr. WHITE and Mr. BLACKBURN were appointed.

The committee divided; and the tellers reported—aye 112, noes 117.

So the amendment of Mr. WHITE was not agreed to.

Mr. BAKER. I offer the following as a substitute for the amendment of the gentleman from Iowa, [Mr. PRICE:]

Strike out all after the word "order" and insert the following:

And that it shall not be in order to insert in any appropriation bill any provision changing existing law, except in reducing the amount of money to be appropriated.

Mr. BLOUNT. I submit that substantially this amendment has been voted on.

The CHAIRMAN. The Chair thinks that this is a different proposition in some respects from any amendment yet voted on.

Mr. STEPHENS. I call for tellers on agreeing to the amendment. Tellers were ordered; and Mr. BAKER and Mr. BLACKBURN were appointed.

The committee divided; and the tellers reported—aye 111, noes 120.

So the amendment of Mr. BAKER was not agreed to.

Mr. UPDEGRAFF, of Ohio. I move that the committee rise.

Mr. BLACKBURN. I ask what amendments are now pending?

The CHAIRMAN. The two pending amendments are that of the gentleman from Alabama [Mr. LOWE] and the substitute therefor offered by the gentleman from Iowa, [Mr. PRICE.]

Mr. BLACKBURN. We evidently cannot to-day get through the amendments which gentlemen desire to offer to this clause; so the committee may as well rise.

The motion of Mr. UPDEGRAFF, of Ohio, was agreed to, there being—aye 135, noes 20.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole had had under consideration the revision of the rules, and had come to no resolution thereon.

FEBRUARY 19, 1880.

REVISION OF THE RULES.

Mr. BLACKBURN. I move that the House now resolve itself into Committee of the Whole for the further consideration of the report of the Committee on Rules.

The motion was agreed to.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, Mr. CARLISLE in the chair.

The CHAIRMAN. The pending question is on the substitute proposed by the gentleman from Iowa [Mr. PRICE] for the amendment of the gentleman from Alabama, [Mr. LOWE,] which the Clerk will read.

The Clerk read as follows:

At the end of paragraph 3 insert the following: "which retrenchment shall not be by inference, but shall in express words specify on its face the amount of money to be saved by the amendment."

The amendment to the amendment was disagreed to.

Mr. WARNER. If in order I desire at this time to offer the following as an amendment to the pending amendment.

Mr. PAGE. I should like to have the original amendment read to which this is offered.

The amendment of Mr. LOWE was read, as follows:

Provided, however, That no provision or amendment of a partisan character shall be in order.

Mr. WARNER. Now read my amendment to that amendment.

The Clerk read as follows:

Strike out all after the word "order" and insert, "except it shall be in order to reduce the expenditure of money authorized or required by such existing law and covered by the bill and to change the law only to the extent necessary to make it conform to such reduction."

The CHAIRMAN. That will be in order if offered as a substitute for the motion to strike out and insert the words proposed by the gentleman from Alabama.

Mr. WARNER. I offer it as a substitute for the amendment of the gentleman from Alabama.

Mr. STEPHENS. Mr. Chairman, I ask permission of the committee to be heard on this subject for ten minutes.

The CHAIRMAN. Debate on the pending clause and all amendments thereto was limited by order of the House to twenty minutes, and that twenty minutes have expired.

Mr. ROBESON. I move the gentleman be allowed to speak by unanimous consent.

The CHAIRMAN. If there be no objection the Chair will interpose none.

Mr. BLACKBURN. I am certainly the last man who would offer any objection to the gentleman from Georgia being heard on this or any other subject which he chose to speak on, but is it in the power of the committee to change the order of the House? I am trying to get a vote on these rules under an order of the Committee on Rules. The House has limited debate to twenty minutes, and that time has expired. I do not understand it is competent for the Committee of the Whole, even by unanimous consent, to rescind that order of the House.

The CHAIRMAN. Of course the committee cannot rescind or change in any respect the order of the House.

Mr. STEPHENS. Except by unanimous consent.

The CHAIRMAN. The only way the committee could do it would be not to raise a question of order against the gentleman from Georgia.

Mr. LOWE. If no objection is raised to the gentleman from Georgia—

The CHAIRMAN. But the gentleman from Kentucky has raised the question of order.

Mr. LOWE. Does the gentleman from Kentucky raise the point of order against the gentleman from Georgia?

Mr. BLACKBURN. The gentleman from Kentucky means just this: If further debate is to be had on this rule it cannot be limited to any one gentleman. We will have to rescind the order of the House limiting debate altogether or else we must execute that order.

The CHAIRMAN. The question, then, is on the adoption of the amendment to the amendment proposed by the gentleman from Ohio.

Mr. SPEER. I move the committee rise for the purpose of extending debate, so the gentleman from Georgia may be heard. This House has never failed to do itself an injustice when it refused to hear the gentleman from Georgia.

Mr. BLACKBURN. I do not understand, Mr. Chairman, it is proper and I deny the propriety of thrusting anything of a personal character into the matter just now pending here. The disclaimer I made was sufficiently broad to protect the objection from any such criticism. I shall oppose any extension of the time for debate on this rule.

Mr. SPEER. I insist on my motion.

The CHAIRMAN. Perhaps the Chair will be pardoned for suggesting to the gentleman from Georgia under the circumstances, even if the committee should rise the time could be extended in the House only by unanimous consent as there was a motion to reconsider, and that motion was laid upon the table.

Mr. BLACKBURN. I shall object.

The CHAIRMAN. Does the gentleman still insist?

Mr. SPEER. As the gentleman from Kentucky notifies me he will object, of course I shall not insist.

The CHAIRMAN. The question, then, is on the amendment to the amendment of the gentleman from Ohio, [Mr. WARNER.]

Mr. HOOKER. I ask for the reading of the amendment to the amendment.

Mr. CONGER. I wish to make a motion. If the majority of the House desire it, I move the committee rise for the purpose of then moving that the House go into the Committee of the Whole on the state of the Union generally.

Mr. HOOKER. Let the amendment be read.

The CHAIRMAN. The amendment to the amendment will be read.

Mr. WARNER's amendment to the amendment was again read.

Mr. PAGE. I make the point of order on that amendment.

Mr. HOOKER. So do I. I have not heard it hitherto. I make the point that the committee has voted substantially on that already.

The CHAIRMAN. The Chair will consider the point of order made and pending, but the first question is on the motion of the gentleman from Michigan that the committee rise, announcing it as his purpose when the committee gets into the House to move that the House resolve itself into the Committee of the Whole on the state of the Union generally.

Mr. CONGER. For the purpose of hearing the remarks proposed to be made by the gentleman from Georgia, [Mr. STEPHENS.]

The question being taken on Mr. CONGER's motion, there were—ayes 92, noes 87.

Mr. BLACKBURN. I call for tellers.

Mr. ROBESON. I rise to a parliamentary question. I want to know, for my own information and the information of the House, whether, if the motion prevails in the House to go into Committee of the Whole on the state of the Union generally, that will simply operate so as to allow the gentleman from Georgia [Mr. STEPHENS] to speak, and no longer than that detain the action of the House in again going into Committee of the Whole to consider the revision of the rules?

The CHAIRMAN. That is not a parliamentary question, or one which can be properly addressed to the Chair.

Mr. BLACKBURN. To save time, I rise to a parliamentary inquiry. Suppose this motion should prevail, would it not require unanimous consent to resolve the House into Committee of the Whole on the state of the Union generally?

The CHAIRMAN. The Chair thinks not.

Mr. BLACKBURN. Very well; I call for tellers.

Mr. CONGER. I had hoped the gentleman who had charge of the rules of the House would have been able to give us that information himself.

Mr. BLACKBURN. The gentleman who has charge of the report on the rules will give the gentleman from Michigan that information at the proper time, and a good deal more, if he will only listen patiently.

Mr. CHALMERS. I rise to a parliamentary inquiry. I desire to know if the House resolve itself into Committee of the Whole on the state of the Union, whether those gentlemen who are down on the list to speak will not be first recognized.

The CHAIRMAN. That will be a question for the Committee of the Whole on the state of the Union, if the House should resolve itself into that committee.

Mr. CHALMERS. I believe that my name stands first on the list.

Mr. ROBESON. I hope we will go into the Committee of the Whole on the state of the Union notwithstanding that, [Laughter.]

Mr. WEAVER. I desire to say I am on the list and will willingly resign in favor of the gentleman from Georgia.

Mr. HOOKER. I believe tellers have been demanded. I hope we will be allowed to have them.

Tellers were ordered; and Mr. BLACKBURN and Mr. CONGER were appointed.

The committee again divided; and the tellers reported—ayes 101, noes 99.

So the motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the report of the Committee on Rules and had come to no resolution thereon.

ORDER OF BUSINESS.

Mr. CONGER. I move that the House resolve itself into Committee of the Whole on the state of the Union generally. My object is to allow the gentleman from Georgia to address the committee.

Mr. DAVIS, of North Carolina. I rise to a question of order. In submitting a motion that the House resolve itself into Committee of the Whole on the state of the Union a gentleman has not the right to state the object he has in making the motion.

Mr. CONGER. That has been done many times in the House when gentlemen have moved that the House resolve itself into Committee of the Whole.

The SPEAKER. The statement of the object is not in order. The Chair will submit the motion. The gentleman from Michigan moves that the House resolve itself into Committee of the Whole House on the state of the Union generally.

Mr. BLACKBURN. Is it in order by way of amendment to move that the House resolve itself into Committee of the Whole on the state of the Union for the purpose of considering the report of the Committee on Rules?

The SPEAKER. The same object can be arrived at by voting down the motion of the gentleman from Michigan.

Mr. BLACKBURN. Have I not the right to offer the motion I have indicated as a substitute for the motion of the gentleman from Michigan?

The SPEAKER. The Chair was bound to recognize the gentleman from Michigan; and the Chair thinks the motion made by that gentleman is not amendable. The remedy is to vote it down.

Mr. BLACKBURN. Then I call for the yeas and nays on the motion of the gentleman from Michigan.

The yeas and nays were ordered.

The question was taken; and there were—yeas 117, nays 115, not voting 60; as follows:

YEAS—117.

Aldrich, N. W.	Felton,	Martin, Joseph J.	Russell, W. A.
Aldrich, William	Field,	Mason,	Sapp,
Anderson,	Fort,	McCoid,	Shallenberger,
Bailey,	Frye,	McKinley,	Smith, A. Herr

So the motion of Mr. CONGER was agreed to.

During the call of the roll the following announcements were made:

Mr. MANNING. My colleague, Mr. MONEY, is paired with Mr. JOYCE, of Vermont; and my colleague, Mr. MULBROW, is paired with Mr. DWIGHT, of New York.

Mr. ROBERTSON. My colleague, Mr. ELAM, is paired with Mr. DICK, of Pennsylvania.

Mr. BUCKNER. I should vote "no" on this motion if I were not paired with Mr. CHITTENDEN, of New York.

Mr. WISE. I would vote "no," if I were not paired with Mr. HOUK, of Tennessee.

Mr. WILLIS. My colleague, Mr. THOMAS TURNER, is paired with Mr. MCGOWAN, of Michigan.

Mr. CABELL. I desire to announce that Mr. ROSS, of New Jersey, is paired with Mr. FISHER, of Pennsylvania.

Mr. LOUNSBURY. I am paired with my colleague, Mr. MCCOOK; if he were present, I should vote "no."

Mr. TOWNSHEND, of Illinois. I desire to announce that Mr. EWING, of Ohio, is paired with Mr. RYAN, of Kansas.

Mr. ROBINSON. Mr. MULLER is paired with Mr. WAIT, of Connecticut.

Mr. HISCOCK. On this question I am paired with my colleague, Mr. BLISS.

Mr. CROWLEY. I am paired with Mr. O'BRIEN, of New York.

Mr. EINSTEIN. I am paired with Mr. CLARK, of New Jersey.

Mr. BLAKE. I am paired with my colleague, Mr. ROSS.

Mr. MCGOWAN. I am paired on all political questions with Mr. THOMAS TURNER, of Kentucky. This question having taken a political turn, I decline to vote.

Mr. BAYNE. I am paired with Mr. MARTIN, of Delaware. If not paired, I should vote "ay."

Mr. DAVIS, of California. I am paired on all political questions with Mr. HENKLE, of Maryland.

Mr. BOYD. I am paired with Mr. HENRY, of Maryland; if he were present, I should vote "ay."

Mr. TALBOTT. My colleague, Mr. MCLANE, is paired with my colleague, Mr. URNER; and my colleague, Mr. HENRY, is paired with Mr. BOYD, of Illinois.

Mr. KLOTZ. I desire to vote.

Mr. CONGER. I wish the Chair would ask the gentleman if he was within the bar before the last name on the roll was called.

Mr. KLOTZ. I was in the Hall during the call of the roll.

The SPEAKER. The gentleman states that he was within the Hall, but outside of the railing.

Mr. CONGER. I suppose the rule would be the proper guide.

The SPEAKER. That is the rule and the practice.

The name of Mr. KLOTZ was then called, and he voted in the negative.

Mr. PHELPS. I ask leave to vote; I was not in during the roll-call.

Mr. CONGER. I object.

Mr. POEHLER. I ask leave to vote.

Mr. CONGER. I object.

Mr. WHITEAKER. I ask leave to vote.

The SPEAKER. Is there objection?

Mr. CONGER. There is objection.

The result of the vote was then announced as above stated.

Mr. BLACKBURN. I move to reconsider the vote by which the motion of the gentleman from Michigan [Mr. CONGER] was agreed to.

Mr. CONGER. And I move to lay that motion on the table.

Mr. BLACKBURN. And on that motion I call for the yeas and nays.

Mr. CONGER. How did the gentleman vote?

Mr. SPEER. I rise to a point of order.

The SPEAKER. The gentleman from Kentucky [Mr. BLACKBURN] has not the right to make the motion to reconsider, if it is questioned.

Mr. BLACKBURN. My right to make that motion was not ques-

tioned; and it was covered by the motion of the gentleman from Michigan to lay the motion to reconsider on the table, and on that motion I have demanded the yeas and nays, and the Speaker has recognized that demand.

The SPEAKER. The Chair certainly recognized the gentleman, but the Chair will never take advantage—

Mr. GARFIELD. I rose to make the point of order.

The SPEAKER. Does the gentleman from Ohio [Mr. GARFIELD] say that he rose for that purpose?

Mr. GARFIELD. I rose for that purpose, and intended to make the point the first moment I could get the attention of the Chair.

The SPEAKER. The Chair recognizes the fact that the gentleman rose.

Mr. CONGER. I desire to say that I did not dream a gentleman having charge of the rules would undertake to make a motion he had no right to make.

Mr. BLACKBURN. There are many things in this world that the gentleman has never dreamed of, but which he ought to know. I made a motion to reconsider. Nobody questioned my right to do it. The gentleman from Michigan recognized my right in moving to lay the motion on the table. On his motion I demanded the yeas and nays. [Cries of "Regular Order."]

The SPEAKER. The regular order is for members to keep order.

Mr. FINLEY. I rise to a parliamentary inquiry. I desire to ask the Chair whether it would be in order for me to change my vote with the view to move to reconsider.

The SPEAKER. The gentleman from Ohio [Mr. FINLEY] asks leave to change his vote. Is there objection?

Several members objected.

The SPEAKER. The Chair did recognize the gentleman from Kentucky, no one objecting, and submitted his motion; the demand for the yeas and nays was also submitted. But the Chair accepts the statement of the gentleman from Ohio [Mr. GARFIELD] that he rose to object to the gentleman from Kentucky making the motion to reconsider.

Several MEMBERS. But he did not do it.

The SPEAKER. Whether he did it or not, the Chair takes the gentleman's word.

Mr. PAGE. I was on my feet myself to object.

The SPEAKER. On the vote just taken the yeas have it; and the House determines to go into Committee of the Whole on the state of the Union generally. The gentleman from Illinois [Mr. SPRINGER] will take the Chair.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, Mr. SPRINGER in the chair.

Mr. CONGER and Mr. BLACKBURN addressed the Chair.

Mr. CONGER. I claim the right to the floor because it was on my motion that the House went into Committee of the Whole.

The CHAIRMAN. The Chair desires to make a statement.

Mr. GARFIELD. The Chair has the floor.

The CHAIRMAN. The Chair requests gentlemen to take their seats and be in order.

Mr. CONGER. I rise to a point of order.

The CHAIRMAN. The Chair desires to announce that the House is now in Committee of the Whole on the state of the Union for general debate. The Chair recognizes the gentleman from Michigan [Mr. CONGER] who made the motion to go into Committee of the Whole.

REVISION OF RULES.

Mr. CONGER. Mr. Chairman, I made this motion in the interest of free speech. [Laughter and applause.] I desired, as others on this side of the Chamber did, the opportunity to hear the views of a distinguished gentleman of this House from Georgia [Mr. STEPHENS] whose legislative experience, whose familiarity with the rules of this House, dates back to a time when the fierce democracy of the other side believed in free speech, in free discussion, in fairness, the old, hard-listed Jacksonian democracy of whom we have before us still a living representative, thank God. [Applause.]

Sir, if in the progress of events in this country it happens that that democratic party once so honored, once so respected, once so esteemed, once embracing so large a portion of all the people of the United States of all sections and all regions, has slipped its moorings—if it has been wandering for years upon unknown seas of adventure—if it has forgotten the principles of Jefferson and Madison and Monroe and Jackson, what a glorious thing it is for the country that there still lives and breathes in our midst, with memory unimpaired, with all his intellectual vigor intact, an old representative of the democracy of those days, then a whig, [laughter and applause,] then acting with the whig party, true to the Constitution, but upholding the Jeffersonian ideas of democracy, [laughter and applause,] and to-day acknowledged by all true democrats as a representative of the old-time democracy, honored by them as such, elected by them as such, having brought into the fold the ark of the covenant of whiggery, and placed it in democratic hands. [Laughter and applause.] How fortunate for all of us—and I address myself to my young compatriots of the democratic party—how fortunate for the old representatives of the whig party, how fortunate for the old representatives of the Jeffersonian and Jacksonian democracy, that the ark of the covenant is still held by the gentleman from Georgia, and that he can tell us what the democracy was in the earlier days, what it was

when the whig party became the depository of its principles, how he has borne that ark along down through all these scenes of revolution and rebellion, all these driftings of parties, and is ready to present it here to-day.

Sir, is it not wonderful that modern democrats refuse to hear this venerable statesman? I know his sentiments; I know his views; I have read them in his published books. Why should the democracy refuse to listen to him? Yet we have the unwonted spectacle to-day of a refusal to hear, even upon the subject of rules, the gentleman from Georgia! Sir, my friends around me at present, the only living representatives in this House of free speech and fair play, joined by gentlemen from Georgia and by a few others from that side of the House, have at last brought us to a position where my friend may speak.

Mr. STEPHENS. Mr. Chairman—

Mr. CONGER. Where the gag is removed from him. And now, sir, with pleasure exceeding that which I have words to express, [laughter,] yielding to the earnest willingness of my friends on this side of the House, yielding to the earnest willingness of the young democracy, even from Kentucky, on that side of the House [laughter] to hear again the old words of democracy from the old and eloquent expounder of their doctrines, I yield as much of my hour as the gentleman from Georgia may desire to occupy. [Laughter and applause on the republican side of the House.] I will give the gentleman all of the hour he may wish, and then I will resume the floor. [Laughter.] If there be any time left I would like to have it. I should like to reply a moment or two after he gets through.

Mr. STEPHENS. I will yield the floor before the expiration of the hour.

Mr. CONGER. I would like to have a moment or two to reply to what the gentleman may say.

The CHAIRMAN. The Chair recognizes the gentleman from Georgia.

Mr. STEPHENS. Mr. Chairman, I am certainly under obligation to the gentleman from Michigan, and to the House, for the privilege of addressing them on this occasion. It was not my purpose in committee before, nor is it my purpose now to speak of the history of parties, democrat or whig, of their principles or my connection with their organizations. I will take occasion, however, to say that my party attachment from the time I entered public life and as long as I shall continue on earth, is as strong and earnest to party, in its right sense, perhaps, as any other who ever lived; I mean to party founded on principle, not to party organization merely. Organizations are ephemeral; principles are incorruptable and live forever. I was reared in the Jeffersonian school of democracy, in which I have lived and moved and had my being, and in it I shall die. Organizations in all things human tend to corruption, and as much so in political party organizations as others.

Now, sir, I did wish to say a few things on Rule XXI and the amendment offered by the gentleman from Ohio, [Mr. WARNER,] without taking into view, however, the question of party organization on this or the other side of the House. It was upon the great principle which I think involved in the amendment. I take this occasion, as my time is not so much limited as it would have been, to say I have taken a deep and profound interest in this codification of the rules. I think I may assume that I have labored as hard in season and out of season to put the system reported to this House in its present shape as any member of that committee. I had not in the discussion of the report consumed but five minutes of the time of the House. The Committee of the Whole had discussed it fully for months—every other member of the Committee on the Revision of the Rules had been heard repeatedly; and, therefore, I did trust I might be permitted ten minutes to give my views on this very important amendment. It is indeed important in my view. The general system reported does certainly embody great improvements. It has simplified, it has codified, it has rendered intelligible the rules of our Government in legislation, and if adopted by the House will accomplish great good. I think I may assume this.

Sir, I said in the five minutes I had before that in the committee on the revision of the rules the first thing done was the adoption of a resolution that we should not report any rule, or any change in existing rules when there was not perfect unanimity in the committee. I mean, that we should not touch any one of the existing rules which did not receive the sanction of every member of the committee; that is, we should touch nothing except by unanimous consent of the committee. This was on my motion. On Rule XXI, as reported, there was diversity of opinion. The committee therefore left it just as we found it.

Now, Mr. Chairman, suppose the House should do the same; of the opposite side of the House I would ask: Are they worsted? Because if you defeat all these rules, we stand, so far as Rule XXI is concerned, just as we are—with the rules of the House as they now are.

I was opposed to that Rule XXI as reported, individually. The right was reserved to us all to oppose its adoption as it stands. Every member of the committee, by mutual agreement, could move any amendment he pleased, or speak or vote against any part of the report which was not carried by unanimity. I was opposed to this rule as it stands in our present system. And why? I do not believe, according to democratic doctrine, Jeffersonian, Madisonian, Jacksonian, and Jeffersonian republicanism also, that it was ever intended that appropriation

bills should be encumbered by any other legislation than appropriations. [Applause on the republican side.] Never, sir! If there has been any progress in this country in legislation, it has been in precluding from appropriation bills the incorporation of matters upon them as riders. The gentleman from Ohio, [Mr. HURD,] if I understood him correctly, the other day said that it was the democratic doctrine to seek redress of grievances by withholding appropriations, standing upon British precedents.

If that be his position—and I so understood it—I repudiate it *toto cælo*. [Applause on the republican side.] Never was there any such doctrine announced in any authorized democratic creed I ever heard of. It has its origin in a monarchical government where there is no written constitution. This doctrine came from England. Withholding appropriations there has been, and is to-day, a legitimate mode of seeking redress of grievances, because that is a monarchy. Powers are not divided there as here. We live under a government founded upon a written constitution; we live in a free representative republic. Here sovereignty does not reside in a crown. There (in England) all sovereign powers are considered as inherent in the Crown; and the Commons, the representatives of the people, for centuries in granting supplies, which is their right, have held the power in their hands to withhold them until their grievances have been redressed. In this way the petition of right, if you please, *habeas corpus*, or any other of the great and essential rights of British subjects were secured, from Magna Charta down, and of which American citizens may well be proud to-day.

But, sir, we live under a different form of government. Ours is a written constitution. We present to the world a system of government unknown in the annals of history. Our sovereign powers are all held in trust—none are inherent in those who exercise them; they are divided into three departments, the legislative, executive, and judicial, each separate, co-ordinate, and coequal departments, each one within its own sphere exercising that class of sovereign powers delegated to it. Under our Constitution the powers delegated to Congress (the legislative department) are specified and enumerated. The powers delegated to the President—the executive—are specified and enumerated. The powers delegated to the judiciary are specially enumerated—all limited and all equally sovereign within their respective spheres under that fundamental law, the Constitution of the United States. Redress of grievances is not provided for in our Constitution by withholding the necessary supplies to carry on the machinery of government as established. The redress of grievances in this country, the repeal of obnoxious laws or other wrongs, is through the peaceful instrumentalities of the organic law, first by an appeal to the legislative body to take off any oppressive burden. The next is to the judiciary—to the courts. And the last to the ballot-box, to the masses of the people at the polls.

Under our written organic law there are no inherent or hereditary rights in the Executive, in members of the Senate or the House, or any other officer of the Government. With us two years is the limit of our service in the House. It is six years in the Senate and four years for the Executive. But, mark you, in the Constitution of the United States the Executive has the same power—rightful power, constitutional power—to veto a bill that we have to pass it. It is his constitutional right to do so if he sees fit.

Now, then, if the House or if Congress should set up a new doctrine of so loading an appropriation bill with a repeal of laws which we do not like—many of them I do not like—but if we do that with a view to seek redress by waging a war upon the veto or the constitutional exercise of it by the Executive, I ask the House and this country, not if it be democracy or republicanism, but is it not anti-constitutional? I state that the President has as much right to veto as we have to pass. Then, as to this veto power, it has from the beginning been, as I understand it, a democratic doctrine to sustain, uphold, and maintain it. The only war waged against it was by those old whigs to whom the gentleman from Michigan alluded. I did belong to that organization under the lead of the gifted Clay—*clarum et venerabile nomen*. His is one of the few immortal names that were not born to die. But exercising that independence of thought and action which I do to-day, I disagreed with him and his organization at that time on that point or article in his creed. But where stood the entire democratic party organization of that period, if I should be disposed to say anything about party politics on this occasion? They stood solid, North and South, in maintaining the Constitution as it was. When and where has the democratic party—the true Jeffersonian democracy, to which then and now I belong—ever changed their position on this subject? In this creed I was born and reared, and in it I will die. Whoever may make departures from it can do so, but I never shall. I shall still cling to the ark of the covenant of our fathers and the time-honored creed of Jeffersonian democracy and old Jeffersonian republicanism.

But, Mr. Chairman, it was not my purpose to refer to that old political history. I want to speak of our rules. I want these rules which we have passed, and which we are now considering, not to be made or shaped with any view to the advantage or disadvantage of one party or another. In forming the fundamental law, constitutional or other organic law, all wise and true men should look to that system which will work best for the maintenance of right and justice in the great future. It is immaterial which party is in power. I am, as I have said, against all political riders, so called, upon appropria-

tion bills and such riders as are intended to coerce executive action. In this I think I am maintaining nothing but what the advanced thought of the age in political science the world over has already arrived at. I say here that in my sixteen years of experience in Congress, before the late separation or war, more corruption and the most mischievous of all legislation which ever occurred during that time, so far as I am aware, came from riders, or amendments to appropriation bills—amendments that could not be passed on their own merits. So greatly was this recognized as the fact that when those members of the old Congress met in Montgomery to make a new constitution, as the gentleman from Michigan referred to it the other day, one of the great wants, as we thought, and I acting my part in it thought, was in that fundamental law to put "the sting of disability in the temptation," to use the language of my able and most distinguished colleague on that occasion, [Mr. Toombs,] in the very constitution of the republic.

The first constitution made for one year—the provisional constitution—had a provision which was referred to by the gentleman from Michigan, the other day, in these words, which I will ask the Clerk to read.

The Clerk read as follows:

The President may veto any appropriation or appropriations, and approve any other appropriation or appropriations in the same bill.—Article 1, section 5, paragraph 1.

Mr. STEPHENS. That was what was done in the provisional constitution, which remedied the great evil to a considerable extent. I ask the Clerk to read what were the provisions in the permanent constitution.

The Clerk read as follows:

ARTICLE I.

SEC. 9, par. 9. Congress shall appropriate no money from the treasury except by a vote of two-thirds of both houses, taken by yeas and nays, unless it be asked and estimated for by some one of the heads of departments and submitted to congress by the president; or for the purpose of paying its own expenses and contingencies; or for the payment of claims against the Confederate States, the justice of which shall have been judicially declared by a tribunal for the investigation of claims against the government, which it is hereby made the duty of congress to establish.

SEC. 10. All bills appropriating money shall specify in Federal currency the exact amount of each appropriation and the purposes for which it is made; and congress shall grant no extra compensation to any public contractor, officer, agent, or servant after such contract shall have been made or such service rendered.

Paragraph 20. Every law, or every resolution having the force of law, shall relate to but one subject, and that shall be expressed in the title.

Mr. STEPHENS. These extracts need no explanation. But, Mr. Chairman, what I wish understood is that what I have asserted here to-day is no newborn idea with me with a view to advance the interest of one party or another on this floor or in the country, but to advance and secure the interests and prosperity of the people everywhere.

The principles embodied in these extracts were the matured thought of years before; they were wisely incorporated in the Confederate States constitution, and I would be glad to see them to-day incorporated not only in the rules of this House but as an amendment in our present Federal Constitution. They are conservative in their character; they watch and guard the Treasury and protect the rights of the people, and especially the money of the people.

Gentlemen on this side of the House speak of being desirous of economy. Economy! Yes; that is the cry—economy! I am for economy, and I say the best way in the world to have true, real, lasting, good economy is to shut down the door and put bonds upon your appropriation committees. [Applause.] That is the best way to have economy. Let these bills be confined to the requirements of existing laws.

I stated that I was but maintaining the advanced thought of civilization in the science of government. Why, sir, a number of the States of this Union—how many I really do not know—have taken the lead in this matter. I am but following in their footsteps. I am told by the gentleman from Tennessee [Mr. WHITTHORNE] that that State has incorporated a similar provision in its constitution. I send to the desk and the Clerk will please read what is the provision of the constitution of Georgia.

The Clerk read as follows:

The general appropriation bill shall embrace nothing except appropriations fixed by previous law, the ordinary expenses of the executive, legislative, and judicial departments of the government, payment of the public debt and interest thereon, and for the support of public institutions and the educational interests of the State. All other appropriations shall be made by separate bills, each embracing but one subject.—Georgia Constitution, 1879, article 3, section 7, paragraph 9.

Mr. STEPHENS. I am for the same rule here that I aided by my advice and counsel in getting established in the new constitution in Georgia. I would, if I could, myself have incorporated in the rules of this House the identical idea that is in the constitution of my native State.

We have been asked what becomes of the Committee on Appropriations? Why, sir, that committee will have its hands full enough to bring forward appropriations according to the estimates under existing laws—labor enough if they will do it well. The labor of that committee is immense when restricted to its legitimate duties. Let them bring forward their bills precisely in the way stated in the Georgia constitution, and who will be harmed by it? Does the pro-

posed amendment prevent that committee from reporting any bill of reform or retrenchment it may see fit? Not at all. The amendment leaves them as untrammelled in reducing expenses as they will be without it. Is their power not unlimited in that respect even with the amendment? If retrenchment is the object, I am for it. If reform is the object, I am for it. Does the power laid down in the Georgia constitution or what I propose prohibit them from going on in that direction if they choose? It does not.

Suppose in this twenty-first rule reported by the committee it should be moved to strike out everything after the word "progress," I would vote for that rather than let it stand as it is. But I prefer the amendment of the gentleman from Ohio, [Mr. WARNER.] I am willing to compromise on that. But I would be willing to vote for striking out the whole of that last sentence. Suppose you do that, will it prevent the Committee on Appropriations from introducing a bill to reduce expenditures in anything under existing laws? No. Will it prevent them from bringing forward any bill of reform? No. Will it prevent any other committee of this House or any member from bringing in a bill to change or repeal an obnoxious law? It will not. If they see fit to reform the Army or to reform any of the other departments of the Government, or to reduce salaries generally, is not the door just as wide as it is now? I think so.

My opinion, therefore, is as I stated at the beginning, that in the appropriation bills there should be no rider. I will state to the committee frankly that one reason why I feel so much interest in this question is found in the intimation of the gentleman from Ohio, [Mr. HURD,] to whom I have alluded, that gentlemen want the rule to stand as it is, that a majority of the House may use it to tack riders on appropriation bills, which appropriation bills must pass or ought to pass, such as the Constitution requires us to pass, and thereby to force the redress of grievances, or the repeal of obnoxious laws, and thus to compel the executive sanction or stop the wheels of government. That is the intimation, as I understand it. Well, sir, my opinion on that subject was very clearly given, not to the world, but to that gentleman and the democratic caucus, when that scheme was tried at the last session. I was opposed to it then; I am opposed to it now, and shall forever be opposed to any such tacking legislation. [Applause.] Hence I think it best that there should be no door for such tacking in the reformation of our rules. There should be no loophole left for allowing any such legislation to be ruled in order.

I again thank the House for this indulgence to me. Had I been permitted to speak when I wished I would not have occupied ten minutes. I yield the floor back to the gentleman from Michigan, [Mr. CONGER.]

Mr. CONGER. I feel unwilling to detain the House from the consideration of the rules, which is a matter of pressing importance; and having now accomplished the object in behalf of free speech and fair play which I desired, if there be no others who wish to discuss this matter I move that the committee rise.

The question being taken on the motion that the committee rise, there were—ayes 104, noes 8.

So (further count not being called for) the motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. SPRINGER reported that the Committee of the Whole House on the state of the Union had, according to order, had under consideration the state of the Union generally and had come to no resolution thereon.

ORDER OF BUSINESS.

Mr. BLACKBURN. Unless it be the pleasure of the House to waste more time, I will now move that the House resolve itself into Committee of the Whole on the state of the Union for the purpose of proceeding with the further consideration of the report of the Committee on Rules.

Mr. TOWNSHEND, of Illinois. Before that motion is put I desire to move that the House take a recess from half past four until half past seven o'clock p. m., for the purpose of further considering the report of the Committee on Rules. If we are to have any legislation this session we should conclude the consideration of that report.

The SPEAKER. Does the gentleman from Kentucky [Mr. BLACKBURN] yield for that motion?

Mr. BLACKBURN. I am willing that there shall be a vote upon it.

Mr. CONGER. I take exception to the remarks of the gentleman from Kentucky—

A MEMBER. It is too late.

The SPEAKER. There has been intervening business.

Mr. CONGER. It is in regard to the present business. The gentleman said that in order to waste no more time—

Mr. BLACKBURN. The gentleman said no such thing.

The SPEAKER. There has been intervening business.

The question was taken on the motion of Mr. TOWNSHEND, of Illinois; and it was not agreed to.

The question was then taken upon the motion of Mr. BLACKBURN; and it was agreed to.

REVISION OF THE RULES.

The House accordingly resolved itself into Committee of the Whole, Mr. CARLISLE in the chair.

The CHAIRMAN. The House is now in Committee of the Whole for the purpose of proceeding with the consideration of the report of

the Committee on Rules. The pending question is upon the amendment offered by the gentleman from Ohio, [Mr. WARNER,] upon which the gentleman from Mississippi [Mr. HOOKER] makes the point of order that the amendment is not in order. The amendment of the gentleman from Ohio [Mr. WARNER] will be read.

The Clerk read the amendment, as follows:

Strike out all after the word "order," in the last sentence of the third clause of Rule XXI, and insert the following:

Except that it shall be in order to reduce the expenditure of money authorized or required by such existing law and covered by the bill, and to change the law only to the extent necessary to make it conform to such reduction.

So that the clause, if amended, would read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except that it shall be in order to reduce the expenditure of money authorized or required by such existing law and covered by the bill and to change the law only to the extent necessary to make it conform to such reduction.

Mr. HOOKER. I make the point of order that substantially the same amendment has already been offered by the gentleman from Ohio [Mr. WARNER] and voted down by the committee. It is true that the pending amendment proposes to strike out something more of the twenty-first rule than did the original amendment; but in substance and reality it proposes to bring the Committee of the Whole to a vote again upon substantially the very same subject-matter that it has already voted down. I therefore hold that the amendment is not in order.

Mr. WARNER. The amendment offered by me some days since, and voted upon in Committee of the Whole, was not the same as this amendment. I think no amendment has heretofore been submitted proposing specifically to limit the change of law so as to make it conform to the reduction of expenditure proposed. I think, therefore, my amendment is clearly in order, as it has not previously been submitted to the committee.

The CHAIRMAN. The Chair has carefully compared the two amendments. While it is evident to the Chair that they are intended to accomplish the same purpose, there is so much difference in their phraseology that the Chair does not feel disposed to take the responsibility of deciding that they are the same thing. The Clerk will read the amendment which was offered by the gentleman from Ohio [Mr. WARNER] the other day and rejected by a vote of the Committee of the Whole.

The Clerk read as follows:

Strike out of the third clause all after the word "order," in the last sentence and insert the following:

Except that it shall be in order to reduce the amounts of money provided for by existing law and covered by the bill, and to that extent only to change the law.

The CHAIRMAN. As the Chair has already observed, the object of the two amendments is undoubtedly the same, but they are couched in very different language, and may be very different things. For instance, in one amendment the words "amounts of money" are used; whereas in the other the words "expenditure of money authorized or required by such existing law" are used. And the concluding portions of the two amendments are in quite different language. The Chair therefore overrules the point of order, and will submit the amendment to the Committee of the Whole.

Mr. SPRINGER. The Chair rules the amendment to be in order?

The CHAIRMAN. The Chair having doubts upon the subject has deemed it best to submit the question to the Committee of the Whole.

The question was then taken by a *viva voce* vote, and before the result was announced

Mr. WARNER called for tellers.

Tellers were ordered; and Mr. WARNER and Mr. BLACKBURN were appointed.

The committee divided; and the tellers reported that there were—ayes 117, noes 109.

So the amendment submitted by Mr. WARNER was agreed to.

Mr. BLACKBURN. I give notice that I will call for the yeas and nays in the House.

Mr. MILLS. I move to amend the third clause of Rule XXI as amended, by adding thereto the following:

But any amendment reducing customs and internal-revenue taxes shall be in order on any appropriation bill.

Mr. CONGER. I make the point of order that that is not germane to the subject-matter of the pending clause.

Mr. MILLS. There is no rule that amendments shall be germane. We are now making rules not in accordance with any previous rules of the House, but whatever rules we may please to make, under the Constitution.

The CHAIRMAN. The subject under consideration by the Committee of the Whole is the proposed revision of the rules of the House. Of course it must be in order to move any amendment which proposes to change any existing rule or to establish a new rule.

Mr. CONGER. My point of order is that the proposed amendment is not germane to the pending clause.

The CHAIRMAN. The Chair has had occasion heretofore to decide that it was not the duty of the presiding officer of this committee to say where a particular provision should be inserted in the report of the Committee on Rules; that is within the province of the Committee of the Whole. The Chair therefore would not rule an amend-

ment out of order because it was not germane to a particular clause under consideration, for the Committee of the Whole might deem it proper to put the amendment in that place rather than where the Chair might think it ought to be put.

Mr. CONGER. But if the Chair pleases, we have followed this revision by paragraphs as if they were sections of a bill; and we cannot go back to a former paragraph.

The CHAIRMAN. The gentleman from Texas does not propose to return to any former paragraph. He proposes to add this to the clause or paragraph now under consideration. The Chair thinks the amendment is in order.

The question being taken, the amendment was not agreed to; there being—ayes 24, noes 86.

Mr. MILLS. I move to amend by adding the following:

And any amendment shall be in order that provides for the retirement of the circulation of national banks, or that prohibits the renewal of their charters.

The question being put on the amendment, there were ayes 61.

Before the negative side was counted,

Mr. FINLEY called for tellers.

Tellers were ordered; and Mr. MILLS and Mr. CONGER were appointed.

Mr. CONGER. I am in favor of the adoption of the amendment in the Committee of the Whole, that we may have a vote in the House by yeas and nays.

Mr. MILLS. I will agree to that.

The CHAIRMAN. The gentleman from Ohio [Mr. GARFIELD] will please act as a teller, instead of the gentleman from Michigan, [Mr. CONGER.]

The committee divided; and the tellers reported—ayes 59, noes 99.

So the amendment was not agreed to.

Mr. MILLS. I move to amend by adding the following:

And any amendment shall be in order that provides for the coinage of silver upon the same terms as gold.

Mr. CONGER. Is that an addition to the clause or an amendment of an amendment?

The CHAIRMAN. The gentleman from Texas has proposed it, the Chair understands, as an addition to the clause which has been amended by vote of the committee.

Mr. CONGER. So that it does not affect the amendment already adopted.

The CHAIRMAN. Not at all.

The question being put, there were ayes 55.

Before the negative side was counted,

Mr. MILLS called for tellers.

Tellers were not ordered.

The negative vote being taken, there were noes 81.

Mr. COOK. No quorum has voted.

Mr. MILLS. I hope the committee may give unanimous consent that a vote by yeas and nays be taken on this proposition in the House. [Cries of "Oh, no!"]

The CHAIRMAN. Does the gentleman from Georgia [Mr. COOK] insist on the point that no quorum has voted?

Mr. COOK. I withdraw it.

Mr. FINLEY. I renew it.

Tellers were ordered; and Mr. MILLS and Mr. GARFIELD were appointed.

The committee divided; and the tellers reported—ayes 34, noes 114.

So the amendment was not agreed to.

Mr. PAGE. The gentleman from New Jersey [Mr. ROBESON] indicated an amendment; when will that be in order?

The CHAIRMAN. The amendment of the gentleman from New Jersey would have been in order at the time he sent it to the desk, if other amendments had not been pending; but since that time the committee has adopted the amendment proposed by the gentleman from Ohio [Mr. WARNER] which strikes out the very words that the gentleman from New Jersey proposed to strike out, and inserts other words in lieu of them. The Chair is therefore of opinion that the amendment of the gentleman from New Jersey, in the form indicated by him the other day, would not now be in order.

Mr. ROBESON. I move, then, to strike out all after the word "changing," and to insert "the effect of existing law be in order."

The CHAIRMAN. This amendment differs from the other, and is in order.

Mr. BLACKBURN. Let it be reduced to writing.

Mr. SPRINGER. Would not this amendment strike out the amendment adopted on motion of the gentlemen from Ohio, [Mr. WARNER?]

The CHAIRMAN. The Chair so understands; but the gentleman from New Jersey proposes to strike out that amendment and something along with it, which makes it in order.

Mr. ROBESON. I offer this amendment, Mr. Chairman, in order to present the square issue whether we shall have any "riders."

Mr. RANDALL, (the Speaker.) The square issue is not whether we shall have any "riders," but whether we shall have any economy.

Mr. PAGE. I ask that the clause as already amended by the adoption of the amendment of the gentleman from Ohio be read.

The CHAIRMAN. The Clerk, before reading the amendment of the gentleman from New Jersey, will report the clause as it now stands amended by the Committee of the Whole.

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except that it shall be in order to reduce the expenditure of money authorized or required by such existing law and covered by the bill, and to change the law only to the extent necessary to make it conform to such reduction.

The CHAIRMAN. The gentleman from New Jersey [Mr. ROBESON] proposes to amend so that the clause will stand as the Clerk will read.

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order.

Mr. WARNER. I wish to make a parliamentary inquiry. If the amendment proposed by the gentleman from New Jersey be adopted, will it strike out the amendment already offered by myself and adopted by the Committee of the Whole?

The CHAIRMAN. It does.

Mr. ROBESON. And that is what it is intended to do.

Mr. WARNER. I only wanted to know.

Mr. SPRINGER. Does this take the place of the amendment of the gentleman from Ohio?

The CHAIRMAN. The proposition is now to strike out that part of the clause which was adopted on the motion of the gentleman from Ohio, and along with it other matter which was reported by the Committee on Rules.

Mr. ATKINS. Have it read again.

The CHAIRMAN. It has been twice reported. Is there objection?

There was no objection, and the amendment was again read.

Mr. BLOUNT demanded tellers.

Tellers were ordered; and Mr. ROBESON and Mr. WARNER were appointed.

The committee divided; and the tellers reported—ayes 115, noes 43. So Mr. ROBESON's amendment was adopted.

Mr. BLACKBURN. I give notice I shall demand the yeas and nays on this in the House.

Mr. MORRISON. I offer what I send to the Clerk's desk as a substitute for the clause as amended.

The Clerk read as follows:

3. No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures by the reduction of the number and salary of the officers of the United States, by the reduction of the compensation of any person paid out of the Treasury of the United States, or by the reduction of amounts of money covered by the bill: *Provided*, That it shall be in order further to amend such bill upon the report of the committee having jurisdiction of the matter of such amendment, which amendment, being germane to the subject-matter of the bill, shall retrench expenditure.

Mr. BLACKBURN demanded tellers.

Tellers were ordered; and Mr. MORRISON and Mr. GARFIELD were appointed.

The committee divided; and the tellers reported—ayes 123, noes 95.

So the amendment was adopted.

Mr. GARFIELD. I offer the following as an addition:

But no proposition or amendment shall be in order except as to amounts of money.

I want to restrict all the changes provided for to money.

Mr. McMAHON. I make the point of order on that. The committee has already agreed to this clause in the shape it is. This is inconsistent with it.

Mr. GARFIELD. This is an addition.

Mr. McMAHON. But it is inconsistent with the clause as the committee has adopted it.

The CHAIRMAN. Whether it is or not is a question for the committee to determine. The committee can always add a proviso.

Mr. GARFIELD demanded tellers.

Tellers were ordered; and Mr. GARFIELD and Mr. BLACKBURN were appointed.

The committee divided; and the tellers reported—ayes 109, noes 122.

So the amendment was rejected.

Mr. WHITE. I move to strike out all after the word "progress" in the original clause reported by the committee. Then the amendment of the House has inserted and added to the original report of the committee certain written matter. I propose to strike out some of the lines of the original proposition together with what has been lately inserted. This is in order.

Mr. BLACKBURN. Is that in order? I make the point it is not.

The CHAIRMAN. The Chair thinks he understands the proposition of the gentleman from Pennsylvania. It is to strike out a part of what has just been inserted by a vote of the committee. The gentleman says that is in order because he proposes to strike out with that some part of the original report of the Committee on Rules.

Mr. WHITE. That is right.

The CHAIRMAN. It is not in order, for that brings it within the rules.

Mr. WHITE. I apprehend the point of order is not well taken. It is competent to strike out part of the original proposition together with what has been just inserted by the House. That is not like an independent proposition of striking out what has been inserted.

The CHAIRMAN. The gentleman will remember the gentleman from Illinois in his amendment incorporated the whole of the first part of the report made by the Committee on Rules, and the committee by its vote just taken have agreed expressly not only to the new matter which the gentleman from Illinois proposes but to the original matter which the Committee on Rules reported.

Mr. WHITE. I understand that.

The CHAIRMAN. Now the gentleman proposes to strike out a part of the very matter that the committee has agreed to.

Mr. STEPHENS. I wish to say a few words upon the point of order. As I understand it, the text of the report of the Committee on Rules has been amended by the Committee of the Whole.

The CHAIRMAN. The Chair will state to the gentleman from Georgia that the whole of clause No. 3, as reported by the Committee on Rules, has been stricken out on the motion of the gentleman from Illinois, and a new clause inserted as a substitute.

Mr. STEPHENS. The whole of it?

The CHAIRMAN. The whole of it. That was the amendment proposed by the gentleman from Illinois which was agreed to by the committee.

Mr. LOWE. I propose to amend the clause.

Mr. STEPHENS. I trust that the point of order may be decided now.

The CHAIRMAN. The Chair has already decided the point.

Mr. HOOKER. I submit that the point of order is no longer debatable.

The CHAIRMAN. As the Chair understands, the gentleman from Alabama now rises to propose an amendment.

Mr. WHITE. I understand that the gentleman from Georgia desires to debate the point of order.

Mr. HOOKER. I understood that the point of order had already been decided by the Chair.

Mr. STEPHENS. I ask for the reading of the amendment proposed by the gentleman from Illinois.

Mr. BLACKBURN. That has been passed.

Mr. STEPHENS. I wish to have it read.

The CHAIRMAN. The gentleman from Georgia asks that the amendment already voted upon be read. Is there objection?

Mr. BLACKBURN. I object.

The CHAIRMAN. The gentleman from Kentucky objects.

Mr. BLACKBURN. I rise to a parliamentary inquiry. What is before the committee?

The CHAIRMAN. Nothing, unless the gentleman from Alabama offers an amendment. The Chair understood the gentleman to rise for the purpose of offering an amendment. Does the gentleman desire to offer an amendment?

Mr. LOWE. I do. I ask it to be read.

The Clerk read as follows:

Provided, however, That no provision or amendment of a partisan character shall be in order.

The House divided; and there were—ayes 61, noes 102.

Mr. LOWE demanded tellers.

Tellers were ordered; and Mr. LOWE and Mr. BLACKBURN were appointed.

The House again divided; and the tellers reported—ayes 70, noes 114.

So the amendment was disagreed to.

The Clerk read as follows:

4. No bill or resolution shall at any time be amended by annexing thereto or incorporating therewith the substance of any other bill or resolution pending before the House.

5. All bills for improvement of rivers and harbors and for the establishment or change of post-routes shall be delivered to the Clerk, as in the case of petitions and memorials, for reference to appropriate committees.

Mr. SPRINGER. I desire to offer an amendment to this clause 5.

The Clerk read as follows:

Amend clause 5 by inserting after the word "all," in the first line, the following words: "private bills and;" making it read, "all private bills and bills for the improvement of rivers and harbors, and for the establishment or change of post-routes," &c.

Mr. SPRINGER. I desire to say a word upon that amendment. It simply provides that all private bills shall be put into the petition-box the same as bills for the establishment of post-routes and petitions or memorials. They will then go to their appropriate committees, the same as petitions go, and when reported to the House by the committee it will be in order to print them, but not otherwise. Up to this time we have had introduced into this Congress near five thousand bills, the great majority of them being of a private nature, and we have been compelled not only to print them at great expense, but to wait here until the Journal of each day has been read. Now, this proposition is for the purpose of economizing time and money by requiring that all these private bills shall go in the first instance to the committee as petitions are now referred, and if reported by a committee they can then be printed, and not otherwise.

Mr. MILLS. Let me say to the gentleman from Illinois that I have had some experience in that direction myself. I can refer him to an

instance where I had a private bill which was sent to a committee and lost, and I was unable to obtain any information whatever in reference to it. What is to be done in such a case as that?

Mr. SPRINGER. Introduce another bill. It would take the gentleman but a very short time to write another or get it ready for presentation.

Mr. MILLS. All of these bills ought to be printed; it costs but little and is a matter of safety as well as convenience.

Mr. SPRINGER. The great bulk of these bills are merely for pensions and private claims of various kinds, and the expense of printing them ought to be avoided when there is no necessity for it.

Mr. CONGER. Mr. Chairman, upon this point I desire to say a few words. Among all these bills which come in under the name of private bills—

Mr. DUNNELL. Will the gentleman yield until the amendment can be again read?

The proposed amendment was again read.

Mr. CONGER. Mr. Chairman, there are bills which would be called private bills, and would be ruled to be such, embracing frequently very large amounts. I think it would be the desire of every one that bills introduced here to which the attention of the House is called should be printed, so that we can have opportunity to know their contents and examine them, and be prepared with our views to act intelligently upon them before the committee report. They ought to be printed, and there is no reason why they should be sent to the committee without printing any more than a great number of unimportant public bills. I hope the amendment will not be adopted.

Of course bills as to harbor and river improvements can be sent without printing, because they go to a committee which prepares a general bill. So with bills in reference to postal routes. They may be sent to the box, because they have all to be incorporated in a general bill. But private bills must all be considered separately. They do not go into one general bill.

Mr. SPRINGER. I have no objection to the printing of private bills if anybody wants them printed.

Mr. DUNNELL. I ask the gentleman from Illinois [Mr. SPRINGER] whether his amendment proposes a continuation of the present rule that private bills shall not be printed?

Mr. SPRINGER. The present rule, which provides that private bills shall not be printed when they have been printed by a previous Congress, will remain in force, if a part of this revision and adopted. It was thought unnecessary to have these bills printed which are introduced session after session, and can be found in the document-room.

Mr. DUNNELL. But under the practical operation of the new rule bills that are private without any exception are not printed, whether they have been previously printed or not.

Mr. SPRINGER. It may be provided at a subsequent point in the revision that such private bills as have not heretofore been printed shall be printed.

Mr. DUNNELL. I think all bills, private and public, should be printed, and then we will have but one place to go to find all the bills and know what they are. Now we have to go to the document-room for public bills and to the file-room for private bills, which is exceedingly inconvenient.

The amendment was not agreed to.

Mr. CHALMERS. I offer the amendment which I send to the desk. The Clerk read as follows:

Add to clause 5 of Rule XXI the following:

For the consideration, preparation, and report of the river and harbor bill the Committee on Commerce shall consist of thirty-eight members, one of whom shall be selected from each State, and that the Speaker shall at once add to the present committee one member from each State not now represented thereon.

Mr. CHALMERS. Mr. Chairman, it seems from the action of the House that the river and harbor bill must necessarily be completed in the committee-room. I desire to say that this amendment is offered after consultation with the chairman of the Committee on Commerce, and while I do not say he is in favor of it he certainly did not indicate any opposition. Upon the contrary, he agreed with me that every State in this Union should have a representative upon the Committee on Commerce in the preparation of the river and harbor bill. It is not intended by this amendment to add to the committee so as to prevent it from being sufficiently small to work well. The amendment simply applies to the river and harbor bill and not to general questions of commerce.

The CHAIRMAN. There is too much confusion. The gentleman from Mississippi will please suspend until order is restored.

Mr. CHALMERS. As I said before, inasmuch as the practice of the House now is well established that the river and harbor bill as perfected in the committee-room becomes the law of the land, it is essential that every State in the Union should have some voice in the preparation of that bill while it is passing through the committee. As it is now, some of the most important States, as the State of Mississippi and the State of Tennessee, both of which are deeply interested in rivers and harbors and their improvement, have no representative on the Committee on Commerce; California has no representative on the Committee on Commerce. I maintain that every State should at least have a representative on that committee in the preparation of that bill, that equal and exact justice should be done to all parts of the country.

I hope gentlemen will think well before they oppose this amendment. It is not brought here in any factious spirit. It is true I made as much of a fight as I could for the Mississippi Levee Committee; but that committee, as we all know, was killed by the action of this Committee of the Whole. The determination to permit the river and harbor bill to be prepared in the committee-room of the Committee on Commerce and then to be passed in this House is the clear declaration on the part of a majority of this House that that is the proper and best way to prepare such a bill.

South Carolina, I believe, has no representative on this committee. There are but fifteen members on it and there are thirty-eight States. If it was intended to extend the membership of the committee to thirty-eight for all the considerations of commerce it might become too unwieldy. The gentleman from Georgia suggested a moment ago it might be necessary in that case to build an extra room to put them in. That is not a good objection since the proposition applies simply to a single bill. It does not interfere with the ordinary legislation considered by the Committee on Commerce. We are all deeply interested in this subject, and I hope gentlemen will reflect well before they reject the proposition I have submitted.

The question being taken on agreeing to Mr. CHALMERS's amendment, there were—ayes 36, noes 70.

So (further count not being called for) the amendment was not agreed to.

The CHAIRMAN. The gentleman from Kentucky [Mr. OSCAR TURNER] desires to offer an amendment.

Mr. HAYES. I move that the committee rise.

The question being taken on the motion that the committee rise, there were—ayes 83, noes 104.

So the motion was not agreed to.

Mr. OSCAR TURNER. I offer the amendment which I send to the desk.

The Clerk read as follows:

Amend Rule XXI by adding as a sixth clause the following:

Upon all bills or resolutions appropriating money or creating a charge or debt upon the people the yeas and nays shall be taken on the final passage of such bills in the House, and entered on the Journal.

Mr. CONGER. Have we not passed to the next rule?

The CHAIRMAN. The committee has passed from the fifth clause of Rule XXI; but the gentleman from Kentucky [Mr. OSCAR TURNER] proposes to add a sixth clause to that rule.

Mr. PHISTER. As my colleague [Mr. OSCAR TURNER] may desire to submit some observations to the committee upon this amendment, I will move that the committee now rise. [Cries of "No!" "No!"]

Mr. BLACKBURN. Let him take his five minutes now; he can only have five minutes.

Mr. PHISTER. I will not press the motion.

Mr. OSCAR TURNER. Mr. Chairman, as I argued this question at the time I gave notice that I would offer this amendment, I do not feel inclined again to trespass upon the time of the committee; but as there may be some members present who were not then, I shall briefly refer to the points that strike my mind, showing conclusively that this amendment, or one embodying the same principle to some extent at least, ought to be adopted. Bills making appropriation of public money have for many years been passed by this House without the call of the yeas and nays. Indeed, the journals show that they are rarely called unless there is some political rider upon the bills or extraneous legislation in them. The result of this is that frequently, in the hurry of legislation and the noise and confusion, although the attention of members is invited by the Speaker to these bills, very few vote upon their passage. It is a fact well known to every member of this House that many bills appropriating millions of the public money pass here by the votes of perhaps four or five members; it may be the votes only of those constituting the committee from which the bills come.

These are facts that no gentleman will deny. Now, sir, this is all wrong. No appropriation of money ought to pass unless the attention of members is drawn directly to the passage of the bill, and no such bill ought to pass without it is voted for by a majority of all the members elected. Now, how are you to effect this result? I know of no way except to require the yeas and nays upon all bills appropriating public money. It is no new idea. Look, Mr. Chairman, at the array of States in this Union that have adopted this provision in their constitutions. I referred in my remarks before to seven States; since then I find that the provision is incorporated in the constitutions of the following States, twenty-two in number:

- | | | | |
|------------------|----------------|-----------------|---------------------|
| 1. New York. | 7. Alabama. | 13. Indiana. | 19. North Carolina. |
| 2. Pennsylvania. | 8. Arkansas. | 14. Kansas. | 20. Ohio. |
| 3. Virginia. | 9. California. | 15. Missouri. | 21. Oregon. |
| 4. Maryland. | 10. Colorado. | 16. Nebraska. | 22. Tennessee. |
| 5. Minnesota. | 11. Florida. | 17. Nevada. | |
| 6. Wisconsin. | 12. Illinois. | 18. New Jersey. | |

Kentucky requires yeas and nays on all bills appropriating over \$100. Many of the old States had tried for over half a century to do without this safeguard of the people's money, but it would not do; they were forced to amend their constitutions and incorporate this provision in them. I will refer to the great States of New York and Pennsylvania, which adopted this provision in 1873, and Kentucky and Virginia in 1850 and 1851. Now, sir, if it is right in the State consti-

tutions why is it not right here? Are the taxes less burdensome on the people when imposed by Congress than by the States. Sir, there is greater reason for it here, for where the Legislatures of the States vote away hundreds of dollars we vote away millions, all coming out of the pockets of the toiling millions of the country.

I have heard but one member urge a reason against this amendment, and that was that it would take too much time. Are the people to be told by us that we have not time to call the yeas and nays upon bills appropriating their money? We are paid by the year and let us take the time. Why, sir, the yeas and nays are called hundreds of times every session upon unimportant questions, frequently even upon the question of daily adjournment. Yet we are told upon these important bills we have not the time. Mr. Chairman, this may be good logic here, but I apprehend gentlemen will find it bad logic on the stump before their constituents. But, sir, the truth is it would not take an unreasonable amount of time. There is too much special legislation here. It is bad enough in the State Legislatures, but it is worse here. Let us pass general laws providing remedies for claimants, and let them resort to the Departments and bureaus and courts, and bring their cases within those laws. If they cannot, then let their claims fall, as they ought to, and not come here to get their claims through where we have not the time to investigate the proof, and where they frequently pass as a sort of favoritism.

Mr. Chairman, this is all wrong, in my judgment. Why, sir, there are now over two thousand private bills for pensions before this Congress already; and God knows how many more will be offered, for they come in by hundreds every bill day; yet we have a pension bureau and laws designating who are entitled to pensions, and under what circumstances. If the general laws granting pensions are insufficient, let us change them and enlarge the grounds for pensions, but not sit here as a great pension bureau instead of attending to general legislation for the public good. If these views were carried out we would not have so many bills appropriating money. I have made these remarks in no partisan spirit, and, sir, I appeal to gentlemen to support the amendment or offer a better one. Let the people know who it is that votes away the money. No man will shrink from it when it is a just appropriation, and if it is not the people have the right to know who voted for it. Mr. Chairman, if this amendment is adopted it will save millions of dollars. It has done it in the States and it will do it here. I hope the amendment will prevail. I am not afraid to put myself on the record on such bills. Special legislation and private bills are a curse in the State Legislatures and they are a curse here.

[Here the hammer fell.]

The question was taken upon the amendment of Mr. OSCAR TURNER; and upon a division there were—ayes 103, noes 19.

No further count being called for, the amendment was agreed to.

Mr. HAWLEY. I give notice that I will call for a vote by yeas and nays upon this amendment in the House.

Mr. BLACKBURN. You have that right.

The Clerk read the following of Rule XXII:

Rule XXII. Of petitions and memorials—

Mr. BLACKBURN. I move that the committee now rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the proposed revision of the rules reported from the Committee on Rules, and had come to no resolution thereon.

FEBRUARY 20, 1880.

ORDER OF BUSINESS.

Mr. WHITE. I desire to make a report from the Committee on Military Affairs.

The SPEAKER. The Chair is advised that two members of the Committee on Military Affairs, who were absent this morning when their committee was called, desire unanimous consent to make reports from that committee.

Mr. BLACKBURN. I must insist upon my motion to go into Committee of the Whole for the further consideration of the report of the Committee on Rules.

Mr. WHITE. Does it not take a two-thirds vote on private bill day?

The SPEAKER. The motion to go into Committee of the Whole on the Private Calendar has been voted down by the House.

The motion of Mr. BLACKBURN was aged to.

REVISION OF THE RULES.

The House accordingly resolved itself into Committee of the Whole, Mr. CARLISLE in the chair.

The CHAIRMAN. The House is now in Committee of the Whole for the purpose of further considering the report of the Committee on Rules. At the time the committee rose yesterday the Clerk had begun the reading of Rule XXII, but had not concluded it. The Clerk will now read.

The Clerk read as follows:

RULE XXII.

OF PETITIONS AND MEMORIALS.

1. Members having petitions or memorials to present may deliver them to the Clerk, indorsing their names and the reference or disposition to be made thereof; and said petitions and memorials, except such as, in the judgment of the Speaker, are of an obscene or insulting character, shall be entered on the Journal together with the names of the members presenting them, and the Clerk shall furnish a transcript thereof to the official reporters of debates for publication in the RECORD.

Mr. DUNNELL. I wish to ask the gentleman from Kentucky [Mr. BLACKBURN] if this rule does away with the present custom of presenting memorials by placing them in the box at the Clerk's desk?

Mr. BLACKBURN. It does not.

Mr. DUNNELL. The phraseology is different from that of the old rule.

Mr. BLACKBURN. In the opinion of the Committee on Rules it does not change the present practice at all.

The Clerk read as follows:

2. Any petition or memorial excluded under this rule shall be returned to the member from whom it was received; and petitions which have been inappropriately referred may, by direction of the committee having possession of the same, be properly referred in the manner originally presented.

Mr. DUNNELL. I have not prepared any amendment to offer to this clause, but during the general debate on this revision I called the attention of the committee to the clause; and the gentleman from Kentucky may remember the criticisms that were then made upon it. It is a departure from the present custom. Now, when a committee has had placed in its possession a bill which in its judgment ought to go to some other committee, the custom is for the committee to report it back to the House, and let the House refer it to that other committee. This, I think, is a very much better rule than that here proposed.

Mr. BLACKBURN. Under the existing rule when a committee has been charged with the consideration of a petition or memorial which in its judgment should be referred to some other committee, there is no way for it to relieve itself of the custody of that paper, except by bringing it back to the House and letting the House make a change of reference. This proposed rule gives to each committee of the House the power of changing the reference of a petition or memorial referred to it, when in the judgment of such committee it has been inappropriately referred.

The only advantage that we claim will result from the adoption of this rule is in the time that will be saved. The gentleman from Minnesota himself, in his long experience in this House, has often known it to be the fact that members of committees were struggling here for days and days to get an opportunity to have a paper re-referred when it had been inappropriately sent to the committee. Thus action by the House is delayed and the time of the House taken up; and I know but very few, if any, instances in which such request has ever been refused. The Committee on Rules in proposing this clause of the twenty-second rule have taken it for granted that each standing or regular committee of the House is able to determine whether a petition or memorial sent to it belongs to it properly or not; and when such a paper has been improperly referred it was the opinion of the Committee on Rules that the committee having the custody of the paper should have the right to make a proper reference of it without coming here and occupying the time and attention of the House.

Mr. HAWLEY. Would not the gentleman have this change of reference appear on the Journal and in the RECORD?

Mr. BLACKBURN. It may be proper that the Journal should show the change of reference.

Mr. DUNNELL. But how will the officers of the House get knowledge of that fact?

Mr. BLACKBURN. The rule does not provide, nor is it possible it shall provide, a method that would bring to the knowledge of the journal clerk officially the change of reference, unless we adhere to the old rule and require that the document shall be brought back to the House.

Mr. HAWLEY. Could there not be added to this rule a clause providing that the committee in such case cause entry to be made on the Journal?

Mr. BLACKBURN. There is no objection to that; but it would simply impose upon the committee proposing the change of reference the duty of notifying the journal clerk.

Mr. HAWLEY. There ought to be some provision of that kind; otherwise we would be put entirely off the track in hunting for a bill.

Mr. BLACKBURN. I have no objection to such an amendment.

Mr. HAYES. Let it be provided that the change of reference shall be entered on the Journal.

Mr. REAGAN. It will be seen that the last part of this clause provides that the paper is to be "properly referred in the manner originally presented." In other words, the committee to whom it may have been improperly referred will refer it to another committee through the petition-box, and thus the new reference will be noted on the Journal.

Mr. HARRIS, of Virginia. Gentlemen will find on examining the pending clause that it has no reference to bills, but refers only to petitions and memorials to be placed in the box.

Mr. RANDALL, (the Speaker.) Is there any proposition pending?

The CHAIRMAN. The Chair understands not.

Mr. DUNNELL. I move to amend the clause by striking out all after the word "referred," in the third line, and adding the following:

Shall be reported back to the House for such further reference as the House shall determine.

Mr. BLACKBURN. That is the rule we have now.

Mr. DUNNELL. This, I confess, is substantially a continuance of the present rule.

Mr. BLACKBURN. Let me call the gentleman's attention to the fact that the clause now under consideration does not treat of bills at all. It speaks only of petitions and memorials which go through the petition-box.

Mr. REAGAN. And when such petitions or memorials have been improperly referred, it authorizes them to come back through the petition-box for proper reference.

Mr. BLACKBURN. This clause simply provides that petitions or memorials improperly referred shall come back for re-reference by the same channel through which they originally came into the House.

Mr. DUNNELL. In view of the explanation which has been made, I withdraw my amendment.

Mr. HAYES. I move to amend the clause by adding the words "and a record of the same shall be made upon the Journal."

Mr. BLACKBURN. This amendment is not necessary. If these papers come back in the same manner in which they were originally presented, as this clause provides they must—that is, through the petition-box—the journal clerk is bound to take note of them.

Mr. HAYES. If that be so, it is all I want. But when I have presented a memorial I want to know where it goes; I want to be able to trace it up.

Mr. BLACKBURN. If the gentleman will look at it I am satisfied he will be content with the rule.

Mr. WEAVER. I move as a substitute for the amendment proposed by the gentlemen from Illinois the following.

The CHAIRMAN. Did not the gentleman from Illinois withdraw his amendment?

Mr. HAYES. If it be true, as stated by the gentleman from Kentucky having charge of the rules, I withdraw my amendment.

Mr. WEAVER. Then I offer it as a separate proposition.

The Clerk read as follows:

At the end of the second clause add as follows:

Unless the member presenting said petition or memorial shall object, in which case said petition or memorial shall not be referred to another committee except by order of the House.

The amendment was rejected.

Mr. FINLEY. I desire to call the attention of the gentleman from Kentucky and of the gentlemen of the House to the fact that this clause should be amended in some way so as to provide for the printing of private bills. We all have had experience of the inconvenience of the present rule in that regard. If the gentleman will consent to the amendment to clause 5 of section 21—

Mr. RANDALL, (the Speaker.) I object.

Mr. FINLEY. Then I move the following as an amendment to clause 3 of section 22.

Mr. BLACKBURN. I reserve the point of order on that amendment.

Mr. FINLEY. I move to add the following:

All bills of a private nature shall be referred to appropriate committees, and ordered to be printed.

Mr. BLACKBURN. I make the point of order that is not germane, and therefore not in order.

The CHAIRMAN. The Chair thinks he cannot dictate to the committee in what part of the report such provision shall be inserted.

Mr. BLACKBURN. This relates to nothing but the petitions or memorials.

The CHAIRMAN. That is true.

Mr. BLACKBURN. Bills are treated of elsewhere, and that part of the report we have already passed.

Mr. FINLEY. I am not at all tenacious about this matter.

Mr. BLACKBURN. Very well, then; let us have a vote on the amendment.

Mr. FINLEY's amendment was rejected.

The Clerk read as follows:

RULE XXIII.

OF COMMITTEES OF THE WHOLE HOUSE.

1. In all cases in forming a Committee of the Whole House the Speaker shall leave his chair after appointing a chairman to preside.

2. Whenever a Committee of the Whole House finds itself without a quorum the chairman shall cause the roll to be called, and thereupon the committee shall rise, and the chairman shall report the names of the absentees to the House, which shall be entered on the Journal.

3. All motions or propositions involving a tax or charge upon the people; all proceedings touching appropriations of money, or bills making appropriations of money or property, or requiring such appropriation to be made, or authorizing payment out of appropriations already made, or releasing any liability to the United States for money or property, shall be first considered in a Committee of the Whole, and a point of order under this rule shall be good at any time before the consideration of a bill has commenced.

Mr. DAVIS, of North Carolina. I move to amend the third clause of Rule XXIII by adding the following.

The Clerk read as follows:

And this clause of Rule XXIII shall not be suspended when the amount involved exceeds \$10,000, unless by unanimous consent.

Mr. DAVIS, of North Carolina. The effect of that rule is to require every bill involving an expense of \$10,000 or more to be considered in the Committee of the Whole on the state of the Union before it can pass. I think the amendment is in the interest of economy and of judicious and discreet legislation, and I do hope it will pass.

Mr. COX. I move to strike out "\$10,000;" for if it is good for \$10,000 it will be good for any amount.

The CHAIRMAN. Does the gentleman strike out the words "when the amount involved exceeds \$10,000?"

Mr. COX. Yes, sir; those are the words I move to strike out.

The CHAIRMAN. So it will then read: "And this clause shall not be suspended except by unanimous consent."

Mr. MILLS. Would that defeat the river and harbor bill on a two-thirds suspension?

Mr. DUNNELL. It seems to me the adoption of this rule would very frequently stop legislation—render it impossible for the House to transact the business which might be before it. We might be on the very last day of a session passing an appropriation bill and might wish to suspend the rules to pass the bill, which, in the history of the House, very frequently is necessary, and yet we are here putting ourselves in the power of one objector, who can prevent the passage of any appropriation bill. The two-third rule is guard and protection enough to a House of Representatives responsible to the people under the Constitution. It seems to me we are tying ourselves down by a rule which we shall be compelled to disregard. Are we not to be trusted in the transaction of public business? A two-third vote ought to be sufficient protection. Here we are asked to adopt a rule so one man may defeat the passage of a bill. I think this is a dangerous rule to adopt.

Mr. DAVIS, of North Carolina. Mr. Speaker, we have now under an amendment that was adopted yesterday a rule which requires the yeas and nays to be taken on all measures. That rule, I suppose, like all other rules, can be suspended. I think there are many cases where it would be proper to suspend the rules where the amount involved is small, as for instance in pension and other small claims coming from the Committee on Invalid Pensions or other committees. But for one I desire that every bill requiring the appropriation of a greater amount of money than \$10,000 shall be considered in the Committee of the Whole where amendments may be proposed, and where they may be considered.

We all know the manner in which the river and harbor bill—and I speak not in any sense in hostility to the committee from which these bills have been heretofore in the habit of coming—but we all know that under a suspension of the rules these bills have been passed without an opportunity for considering or amending them in any form. They have been passed as they come from the committee, and I submit there can be no danger when any appropriation of money is considered in Committee of the Whole. But there is danger even of two-thirds of this House agreeing to pass through under a gag-law bills like the river and harbor bill, which cover many items.

Mr. DUNNELL rose.

The CHAIRMAN. The Chair desires to state that he has not held the gentleman in this instance to the strict rule, but he gives notice that hereafter he will do so. The gentleman from North Carolina addressed the committee and took his seat, and by a strict construction of the rules he would not have been permitted to address the committee again. The Chair, however, allowed him to do so and will now grant the gentleman from Minnesota the same privilege.

Mr. DUNNELL. I wish to say, in reply to the gentleman who has just addressed the committee, that I do not suppose the House will adopt the rule that was made yesterday on the motion of the gentleman from Kentucky. While the gentleman very well stated his side of the case, I do not believe the House will adopt the rule that the gentleman introduced.

Now, for one, I hope that we will get through with this new code, and that the House will adopt it in some form as an improvement upon the old system. I desire to vote for it, and I will vote for it as it stands rather than see it defeated. But with reference to that portion of the report of the Committee on Rules which has not yet been passed, I sincerely hope that it will not be loaded down with amendments like we adopted on yesterday, to which I have referred, and like this which the gentleman here proposes.

Mr. SAMFORD. I desire to offer the following as an amendment.

The Clerk read as follows:

Provided, That a bill may be passed under a suspension of the rules by a two-thirds vote taken by yeas and nays without going to the Committee of the Whole.

The CHAIRMAN. The gentleman from North Carolina proposed an amendment, and the gentleman from New York [Mr. COX] proposed an amendment to that amendment, and until that is disposed of no other amendment can be in order.

Mr. SAMFORD. I understand that the gentleman from North Carolina accepts the amendment which I have offered.

Mr. DAVIS, of North Carolina. I do accept the amendment.

The CHAIRMAN. The amendment of the gentleman from Alabama is in order.

Mr. SAMFORD. The object of that amendment is not to prevent the necessary restrictions which should be thrown around the disbursement of money. Many cases will arise such as have been suggested by the gentleman from Minnesota where we will not have time to put these bills into the Committee of the Whole for consideration,

but this amendment will require sufficient consideration so that members of the House may be able to consider these bills before they are voted on, as it will require a two-thirds vote by yeas and nays to suspend this rule. At the same time it will not destroy that salutary restriction which should be thrown around every money bill.

The CHAIRMAN. The Chair understood the gentleman from North Carolina to say that he accepted the amendment of the gentleman from New York. Was that correct?

Mr. DAVIS, of North Carolina. It was.

The CHAIRMAN. And now the gentleman accepts the amendment proposed by the gentleman from Alabama also, which takes the gentleman's original amendment away from the committee, and the question, therefore, now is upon the adoption of the amendment proposed by the gentleman from New York.

Mr. COX. I would like to hear the amendment of the gentleman from Alabama read again.

The amendment was again read.

Mr. HAWLEY. Now let us have the whole amendment.

The CHAIRMAN. That is the whole of it.

Mr. COX. I have not accepted the amendment myself.

Mr. SAMFORD. The gentleman from North Carolina accepted the amendment of the gentleman from New York.

The CHAIRMAN. The Chair will state the question. The gentleman from North Carolina proposed an amendment, and the gentleman from New York also proposed an amendment, which was accepted by the gentleman from North Carolina, as the Chair understands. Then the gentleman from Alabama offered an amendment, which the gentleman from North Carolina also accepted, so that the only proposition now before the committee is the amendment proposed by the gentleman from Alabama, which has been read.

Mr. COX. I propose now to address myself to the amendment suggested by my friend from Alabama. That proviso seems to be based on the idea that a two-thirds vote can suspend the rules at any time, while our rules only fix certain times when it may be done, as, for instance, on Monday and the last six days of the session.

Mr. SAMFORD. I am in favor of all restrictions being thrown around our legislation which it is possible to have. But cases may arise when it is absolutely necessary that there should be legislative action, and if you have the rules so that you cannot suspend them at all you will occasionally be in a bad fix.

Mr. COX. I will not detain the committee, as I know the anxiety of my friend from Kentucky [Mr. BLACKBURN] to get on with the rules. I am in favor of having every money bill that comes here discussed in Committee of the Whole. I am opposed to any bill of a money character going through without debate and without amendment. We only truly represent the people when we stand upon that principle.

Mr. CLYMER. My objection to the proposition of the gentleman from Alabama is that while now we can only move to suspend the rules on Monday, his amendment would make such a motion in order on any day. The effect of it would be to give us an eternal Monday.

Mr. REAGAN. The rule as reported by the committee, it seems to me, covers all that is necessary; and I do not see the necessity of the House putting itself in a strait-jacket so that it cannot do anything. We have all the necessary safeguards in the rules reported by the committee; and if gentlemen want the revision of the rules to be adopted they had better not fix them so as to compel the rejection of the whole codification. This should be considered when it is proposed to provide restrictions additional to those reported by the committee.

The question being put on Mr. SAMFORD's amendment, it was not agreed to.

The Clerk resumed the reading of Rule XXIII and read as follows:

4. In Committee of the Whole House on the state of the Union the bills on the Calendar shall be taken up in their order; but when objection is made to the consideration of a bill a majority of the House shall decide without debate whether it shall be disposed of or laid aside for the present.

5. When general debate is closed by order of the House any member shall be allowed five minutes to explain any amendment he may offer, after which the member who shall first obtain the floor shall be allowed to speak five minutes in opposition to it, and there shall be no further debate thereon; but the same privilege of debate shall be allowed in favor of and against any amendment that may be offered to an amendment; and neither an amendment nor an amendment to an amendment shall be withdrawn by the mover thereof unless by the unanimous consent of the committee.

Mr. PAGE. Clause 5 limits the debate on any amendment that may be offered in Committee of the Whole to an appropriation bill or any other bill to two speeches of five minutes each after general debate has been closed. It seems to me that is bringing the thing down to a very narrow limit.

The CHAIRMAN. That is the rule now.

Mr. PAGE. Then the rule is not enforced now.

Mr. HAYES. You can move formal amendments.

The CHAIRMAN. It is the identical rule which now exists.

The Clerk resumed the reading and read as follows:

6. The House may, by the vote of a majority of the members present, at any time after the five minutes' debate has begun upon proposed amendments to any section or paragraph to a bill, close all debate upon such section or paragraph or, at its election, upon the pending amendments only; but this shall not preclude further amendment, to be decided without debate.

7. A motion to strike out the enacting words of a bill shall have precedence of a motion to amend; and, if carried, shall be considered equivalent to its rejection. Whenever a bill is reported from a Committee of the Whole with a recommenda-

tion to strike out the enacting words, and such recommendation is disagreed to by the House, the bill shall stand recommitted to the said committee without further action by the House. But before the question of concurrence is submitted, it is in order to entertain a motion to refer the bill to any committee, with or without instructions, and when the same is again reported to the House it shall be referred to the Committee of the Whole without debate.

8. The rules of proceeding in the House shall be observed in Committees of the Whole House so far as they may be applicable.

RULE XXIV.

ORDER OF BUSINESS.

1. Each Monday morning, during a session of Congress, all the States and Territories shall be called in their alphabetical order for bills, joint resolutions, and memorials of State and Territorial Legislatures, and House resolutions, for reference; and, on this call only, resolutions of inquiry directed to the heads of the Executive Departments shall be in order, to be submitted and referred to the appropriate committees, which shall report thereon to the House within one week.

Mr. MILLS. I offer the amendment which I send to the desk.

The Clerk read as follows:

In line 6 of the first paragraph of Rule XXIV strike out all after the word "submitted" and insert as follows:

And said resolution shall lie upon the table; and the mover or proposer of such resolution shall be permitted to call up the same after the reading of the Journal during any time after the expiration of one week and have the same submitted to a vote of the House without debate.

Mr. MILLS. I have submitted this amendment to my friend from Maine, [Mr. FRYE,] and he approves of it. I will explain it briefly to the Committee of the Whole, and when I have done so I am sure there will be no objection to it.

Under the existing rule a resolution calling for information is required to be referred to a committee, and that committee is authorized and required to report within a week and then the House can act upon it. The Committee on Rules in this revision also authorizes the committee to whom a resolution of inquiry is required to report within a week; but the report when it is made goes on the Calendar. You have then to wait until that point of the Calendar is reached, and it may be three or four months before you can get the information. This amendment simply requires that a resolution calling for information shall lie upon the table, after being submitted and read, for one week, that everybody may have time to think of it, and that after one week the proposer can call it up and submit it without debate to a vote of the House.

The amendment was agreed to.

Mr. DUNNELL. I wish to ask the gentleman from Kentucky [Mr. BLACKBURN] one question. As I understand, by this first clause of the twenty-fourth rule what is known as the morning hour on Monday is dispensed with, and all the States and Territories shall be called for the introduction of bills, joint resolutions, &c.

Mr. BLACKBURN. Yes, and in their alphabetical order.

Mr. RANDALL, (the Speaker.) So that on Monday every Member representing a State and every Delegate from a Territory who has bills, &c., to present for reference shall have that opportunity.

Mr. DUNNELL. That is right.

Mr. GILLETTE. I offer as an amendment, to come in after the first paragraph, what I send to the desk.

The Clerk read as follows:

Each member of this House shall be entitled to introduce one bill upon one general subject during each Congress and to report the same upon his own authority for reference to its proper Calendar, and shall be recognized for that purpose by the Speaker during the call of States for bills on Mondays. These bills shall be known as *individual bills*, and shall be so designated upon their face, and shall be printed and placed upon their proper Calendar the same as if reported by some committee of this House.

Mr. GILLETTE. Mr. Chairman, each member of this House represents about one hundred and fifty thousand American citizens. When we come here charged by the votes of our constituents with some special duties, the introduction of some measures or policy dear to them, we come as *absolute equals*, as we were designed to be by the founders of this Government. But we are hardly seated in our places before three-quarters of us are sent to the rear, or, perhaps, I should say, pigeon-holed in committees, whose duties, if they have any, are utterly foreign to our mission here, and we find ourselves ciphers, or the next thing to it, in this congressional machine, and find it impossible to get a solitary measure before this House for consideration unless by the grace of a handful of our brother members who were sent to the front by the same *ipse dixit* that sent us to the rear. Without a solitary vote of this House, before we knew it, in the twinkling of an eye, a Chinese wall of distinction was built up between the ins and the outs—between a half dozen committees and the rest of the members. In short, the purest despotism in the world was organized over our heads, and it was done by these rules, which we are asked to perpetuate, which we have tried to republicanize a little by dividing up the responsibilities between more committees, but have almost entirely failed. Now, I ask for one crumb of justice to each district in the United States; I ask that each member shall know when he comes that during his two years of congressional duties he may be able to bring to the consideration of this House *one measure* in deference to the desires of his constituents, in deference to his pledges to the people.

I claim that under my amendment these individual bills would be as well or better considered than if in the hands of a committee, because the reputation of each member presenting them would be at stake, and these bills would embody the wishes of each congressional district. My measure would simply open one door for the direct rep-

resentation of every section of the country upon this floor. It is not a partisan measure, but a national one in the interest of democratic government. Every man in my presence knows that I speak only the truth when I say that under these rules even a majority is helpless in this House. For example, last session we voted by a handsome majority in favor of an income-tax bill, but it failed to pass because not reported by a committee, and although a majority of us desire to pass such a bill, we have not a committee in this House that will report it and let us vote upon it. More than one hundred members were sent here pledged to vote for the retirement of all national-bank notes and the issue in lieu thereof of United States money; pledged to restore to the nation the greatest prerogative of sovereignty, the control of the circulating medium. The only committee that could report a bill for this object are as dumb as an oyster, and will remain so, notwithstanding they have had a perfect shower-bath of bills referred to them by the House for this purpose. I mention this to show how this House is hampered and tied and gagged by these autocratic rules, and to appeal to every representative of freemen on this floor to demand this one measure of equality for the people of his district that this House may be in some sense a House of Representatives of the people. I know the great committees that control us will object, but I appeal to the men all over this House, the three-quarters that are frozen out and sent to the rear, to stand by my demand that each shall have one chance in two years before this body. The people all over this country are groaning under rings and monopolies. Centralization in railroads gives them railroad kings to extort crushing tribute from them; centralization of capital, with corrupt class legislation, gives them over two thousand national-bank presidents, who organize with such power as to control the machinery of this Government and defy its authority, while they lay heavier burdens upon the people than they can bear.

These and other abuses could not stand an hour outside but for the more dangerous centralization in this House; for it is utterly impossible to get a single measure of substantial relief before this body under these rules. There are rings everywhere, but the head-center of all rings is right here, created by these rules, and every bill introduced for the overthrow of centralization and rings outside has to run the gauntlet of the centralization and rings in this House, and if we are not men enough to take the control and give this House a republican government where one Representative stands upon the same footing as another, and each member has a right to bring at least one measure before this body, then we can never hope to reach the monopolies outside that are crushing the people and menacing their liberties. Physician heal thyself!

In England during the latter part of the last and early in this century, when the right of franchise was extremely limited, all the elective offices were purchased of the voters in open market by the most unblushing bribery. As soon as the right of suffrage was greatly extended it became impossible to bribe the voters, and purity of elections ensued. So it is in this House. If equal rights can be extended to all the members it will at once become impossible for corporations and capitalists to control legislation.

I have heard of slaves so degraded that they would advocate slavery as preferable to freedom, but it is the greatest wonder of the world that honored Representatives of proud, free American citizens will stand up in this House and vote away their rights and the rights of their constituents, imposing upon themselves fetters and disabilities of every kind by these rules, drafted in the interest of the cunning few—drafted by members who now enjoy the best offices in this House, by leading republicans and democrats who have pooled their issues in order that they may continue to hold the key to legislation that belongs by every principle of justice equally to us all. They leave no stone unturned in their efforts to persuade all the members to vote for these rules. Whenever it is necessary the party tiger is brought out on either side in order to fill the minds of members with party prejudice and in the heat of passion induce them to vote their rights away.

I protest against a system of government for this House which cuts off from this body the pulsations of the American people, which practically counts out the rural districts and gives the control of the nation into the hands of eastern cities and corporations. I warn all who hear my voice that if these rules as reported are to be the law of this body, the greatest danger to our liberties lies right here, in a centralized government, not a representative one—a government practically out of the reach of the masses of the people.

Mr. GARFIELD. The gentleman ought to extend the time of each Congress five years in order to carry out such a rule.

The question being taken on Mr. GILLETTE's amendment, there were—ayes 53, noes 74.

Mr. LOWE. A quorum has not voted.

The CHAIRMAN. A quorum not having voted the Chair will order tellers, and appoints the gentleman from Kentucky, Mr. BLACKBURN, and the gentleman from Iowa, Mr. GILLETTE.

The committee again divided; and the tellers reported—ayes 50, noes 93.

So further count not being insisted on) the amendment was not agreed to.

Mr. GILLETTE. I offer now the amendment which I send to the desk, to come in as a separate clause after the first clause of Rule XXIV.

The Clerk reads as follows:

Each member of this House shall be entitled to introduce one bill upon one general subject during each Congress, to be known as an *individual bill*, and to be so marked upon its face, which shall be referred to its proper committee for consideration and report. These bills shall be reported to the House within four weeks of the date of reference, with the committee report thereto attached, and shall go upon the proper Calendar with the report of the committee, whether that report is favorable or adverse, and in case they are not reported by the committee within the specified time, they are to be placed upon the Calendar as if reported for the action of this House.

Mr. GILLETTE. I think I have left out everything which in the amendment just voted upon might have been looked upon as objectionable by any member of this House. These bills, under the arrangement I now propose, would go to the appropriate committees, and there would be one month for the committee to discuss and report them. The amendment simply opens the door so that each district of the United States can get before this House any measure on which its Representative particularly desires action, at least once during the existence of a Congress.

The question was taken upon the amendment of Mr. GILLETTE; and upon a division there were—ayes 25, noes 87.

No further count being called for, the amendment was not agreed to. The Clerk read as follows:

2. On all days other than Monday, as soon as the Journal is read and approved, there shall be a morning hour for reports from committees, which shall be appropriately referred and printed; and the Speaker shall call upon each standing committee in regular order, and then upon the select committees; and if the whole of the hour is not consumed by this call, then it shall be in order to proceed to the consideration of other business, but if he shall not complete the call within the hour, he shall resume it in the succeeding morning hour where he left off.

Mr. WILLIAMS, of Wisconsin. I move to amend the clause just read by inserting, after the words "shall be appropriately referred and printed," the words "and a copy thereof mailed to each Member and Delegate;" so that the clause, if amended will read as follows:

On all days other than Mondays, as soon as the Journal is read and approved, there shall be a morning hour for reports from committees, which shall be appropriately referred and printed, and a copy thereof mailed to each Member and Delegate, &c.

Mr. BLACKBURN. Let me say to the gentleman from Wisconsin that I have no authority from the Committee on Rules to accept his proposed amendment; but for myself I have no objection to it.

Mr. GARFIELD. I think it is a good thing.

Mr. BLACKBURN. So do I.

Mr. RANDALL, (the Speaker.) If the amendment shall be adopted, then no member would ever have the right to say that he was not informed, because if he did not obtain the information under this proposed amendment it would be his own fault.

A MEMBER. It might use up all the copies that were printed.

Mr. GARFIELD. There are 1,500 copies printed, and the effect of this amendment would be merely to provide each member with a copy in his own room. I think it is right.

Mr. ROBINSON. The amendment proposed does not impose this duty on any person in particular. It merely says "shall be mailed," but does not say by whom.

Mr. WILLIAMS, of Wisconsin. It merely refers to bills which are reported from committees.

Mr. ROBINSON. I agree that it should be done, but who is to do it?

Mr. BLACKBURN. It can be done by the clerk.

Mr. WILLIAMS, of Wisconsin. Let them be mailed as the RECORDS are mailed.

Mr. BLACKBURN. I would suggest the insertion of the words "by the Clerk."

Mr. WILLIAMS, of Wisconsin. I have no objection to that.

Mr. KEIFER. It may be imposing too much duty on the Clerk.

Mr. GARFIELD. Insert the words "by the Public Printer."

Mr. WILLIAMS, of Wisconsin. I will accept that suggestion.

Mr. KEIFER. If those words are not inserted that would be the result.

The question was then taken upon the amendment as modified, and it was adopted.

Mr. DUNNELL. I have heard some discussion in regard to the construction that would be put upon this sentence of this pending clause: "there shall be a morning hour for reports from committees, which shall be appropriately referred and printed." The question that arises in my mind is whether it would be competent for the member of a committee reporting a bill to ask that it be put on its passage; or whether this is intended to be an iron arbitrary rule, sending each report so made to its proper calendar.

Mr. BLACKBURN. The Committee on Rules have in this proposed revision sought to do away with the practice of consuming the morning hour in the consideration of bills that may be reported, and to provide for sending each bill when reported to its place upon the proper calendar. This clause of the twenty-fourth rule was framed with that view. It is the purpose, and the purpose will be accomplished if this revision is adopted by the House, to put a stop to the consumption of the morning hour by the consideration and discussion of any report made from a committee in that hour.

Mr. DUNNELL. The question was whether, in case I should make a report from a committee, I would be in order to ask for the consideration and passage of the bill so reported.

Mr. CLYMER. You would be in order to ask it, but it would require unanimous consent.

Mr. BLACKBURN. My construction of the clause is this: unanimous consent could be granted for that purpose by the House, for the House can do anything by unanimous consent; but it could not be done otherwise.

The Clerk read the following:

3. The morning hour for the call of committees shall not be dispensed with except by a vote of two-thirds of those present and voting thereon.

Mr. WILLIAMS, of Wisconsin. I move to amend the clause just read by adding thereto what I send to the Clerk's desk.

The Clerk read as follows:

Add to clause 3, Rule XXIV, the following:

Nor shall it be in order at any time for the Speaker to ask that business be transacted by unanimous consent, except to dispense with the reading of papers, grant leave of absence, and present executive communications or other papers or make such communications as are proper for the Speaker to do; but where unanimous consent would otherwise be required to transact business the question, upon motion, shall be decided by the House without debate, which motion shall be subject to a call for the regular order of business by ten or more members, and shall not prevail unless sustained by a two-thirds vote of the members present and voting.

Mr. RANDALL, (the Speaker.) Will the gentleman explain the effect of his amendment?

Mr. WILLIAMS, of Wisconsin. On another occasion I spoke somewhat at length upon this proposed amendment. I desire now only to state its effect as I understand it. It is this: that no business shall be done here by unanimous consent, but where unanimous consent would otherwise be required, it shall be determined by a two-third vote, and that motion be subject to a call for the regular order by ten or more members.

Why should any one desiring unanimous consent object to this? If unanimous consent can be obtained, of course a two-thirds vote can be, for the greater includes the less. So that the only possible objection there can be is that it would take a little more time to obtain consent in this way, and that is just what I think very desirable and important. On the other hand, if the members demand the regular order, or if, for instance, the members of a committee desire to go on with the regular business before the House, being ten or more, they can call for the regular order; and the motion for the purpose now requiring unanimous consent cannot be submitted to the House at all.

In other words, the object is to take from one man the power to block the wheels of legislation in this House, and invest it in ten or more. How many times within the last two weeks have we seen the business of the House clogged and jeopardized by a single objection? When we wanted to reach the fishery bill the other day, it was said that against objection it would take two hours to do it under the rules as they now stand, though if the proposition had been put to a vote of the House, nine-tenths of all the members would have voted to take that bill up. Yet they were powerless under a single omnipotent objection. I desire to cast no reflection on the gentleman objecting, first because I have no idea who he was, and second because he was exercising his undoubted right under the rules of the House, of which nobody had any right to complain. This amendment will put it in the power of ten men, instead of one, to say when the regular order of business shall be delayed, and put the matter under the control of the vote of two-thirds of the members, instead of a unanimous vote.

Look at the condition of business here. On every Monday morning, even at this stage of the session, one hundred and fifty, one hundred and sixty, or one hundred and seventy-five new bills pour in like a cataract. Then from ten to twenty-five more are brought in by unanimous consent on every morning of the week. This badgering for unanimous consent must be a burden upon the Speaker. He is importuned by members for preference. And yet such proceeding rests wholly upon the temper and caprice of a single member. We crowd down in front of the Clerk's desk with bills or resolutions or propositions of which the House knows nothing, each seeks recognition. The Speaker does the very best he can, discriminating between members, I think, fairly. All at once some member whose breakfast possibly distresses him, demands "the regular order." A few members have succeeded in getting recognized, and the rest go away disgusted, not ruled down by the Speaker or the House, but put down by a single member. Could anything better confirm Hatsel's doctrine that "it is much more material that there should be a rule to go by, than what that rule is; that there may be a uniformity of proceeding in business not subject to the caprice of the Speaker or capriciousness of the members." Yet what more completely breaks up uniformity and promotes confusion than the scenes I have alluded to.

Memorials are presented with the request that they be printed in the RECORD, by unanimous consent. My friend, the gentleman from California, [Mr. PAGE,] I believe, succeeded the other morning in having a memorial published in that way, and I was glad he did. I admired his pluck and push to get recognized; but immediately afterward some gentleman on the other side asked a similar favor; some member shouted "regular order!" as though he had awakened from a nightmare; and that memorial went the way of all the unfortunates to the petition-box.

Now, why should not this power of objection be taken out of the hands of one man and placed in the hands of ten or more? And what objection can there be, when the request for unanimous consent or

its equivalent is asked, that we stop a moment, let the question be stated by the Speaker, let the House get full possession of it and understand just what is going on, then, when objection is asked for, let ten or more object if they desire, and, if not, let the question be put and decided by a two-thirds vote of the members? Who can object to this unless he does not want time, but wants these matters to go through under whip and spur before members can really know whether they wish to object or not? The effect of the amendment would be to put the House fully in possession of matters proposed, give it a moment to reflect, and enable it to act intelligently. At least that is what I desire by the proposed amendment, and if its effect should be to prevent the too frequent granting of unanimous consent I do not think it would be any the worse for that.

[Here the hammer fell.]

The question being taken on the amendment of Mr. WILLIAMS, of Wisconsin, it was not agreed to, there being—ayes 49, noes 68.

The Clerk read as follows:

4. After the hour shall have been devoted to reports from committees, the consideration of the unfinished business in which the House may be engaged at an adjournment shall be resumed, and at the same time each day thereafter, other than Monday, until disposed of; and the consideration of all other unfinished business shall be resumed whenever the class of business to which it belongs shall be in order.

Mr. FRYE. I am instructed by the Committee on Rules to propose certain amendments to this clause, which are rendered necessary by the adoption of an amendment which I offered at the request of the committee a few days since. I move to amend by inserting after the word "committees," in the first line, the words "it shall be in order to proceed to;" by striking out in the third line the words "shall be resumed;" by inserting in the fourth line, after the word "and," the words "it shall be in order to proceed to;" and in the fifth line, by striking out the words "shall be resumed."

Mr. GARFIELD. These are all formal amendments, necessary merely in order to make this clause conform to the previous action of the Committee of the Whole.

Mr. FRYE. With these amendments the clause will read as follows:

After the hour shall have been devoted to reports from committees it shall be in order to proceed to the consideration of the unfinished business in which the House may be engaged at an adjournment; and at the same time each day thereafter, other than Monday, until disposed of; and it shall be in order to proceed to the consideration of all other unfinished business whenever the class of business to which it belongs shall be in order.

Mr. RANDALL, (the Speaker.) I wish to direct the attention of the gentleman from Maine [Mr. FRYE] to the necessity of another amendment in this clause. One of the amendments which the Committee on Rules recommend for adoption is to provide in the twenty-eighth rule that motions for a suspension of the rules shall be in order only on the first and the third Monday of every month, so that the other Mondays of the month shall be devoted to the business of the House in the same manner as on any other day of the week. I suggest, therefore, whether in this clause the words "other than Monday" should not read "other than the first and the third Monday."

Mr. FRYE. I suggest to the gentleman from Pennsylvania, the Speaker of the House, whether it is not proper to make first the amendments required by the action of the Committee of the Whole already taken; and then no doubt unanimous consent will be given that if the twenty-eighth rule should be amended in the manner indicated, we may return to this clause and amend it so as to conform to that action.

Mr. WEAVER. We do not want to do anything now that will bind the House to adopt the amendment which the gentleman from Pennsylvania, the Speaker of the House, has indicated.

Mr. RANDALL, (the Speaker.) Of course not. All we want is opportunity to make the rules consistent in all their parts.

The CHAIRMAN. The Chair understands that the request is simply that, if certain amendments be adopted to Rule XXVIII, the Committee of the Whole shall have the privilege of returning to the pending clause for the purpose of making it conform.

Mr. FRYE. That is it.

The CHAIRMAN. The Chair understood the gentleman from Maine to move to amend so as to provide, "it shall be in order to proceed to the consideration," &c. Does the gentleman mean that, or does he mean to make the language read, "it shall be in order to entertain a motion that the House do now proceed to the consideration," which is the language used in the next clause of the same rule with regard to business on the Speaker's table?

Mr. FRYE. I understand the meaning to be the same. The language I have suggested is that used in clause 2 and in two or three other places.

Mr. WARNER. I suggest to the gentleman from Maine whether or not in the third line of this clause the language should not be "may have been engaged" instead of "may be engaged." It refers to a previous stage of proceeding.

Mr. HAWLEY. "May have been engaged" is better.

Mr. FRYE. I have no objection to including that modification in my amendment.

The amendment of Mr. FRYE, as modified, was adopted.

Mr. FRYE. Was unanimous consent given that, if the twenty-eighth rule should be amended, we might return to this clause and amend it so as to harmonize with Rule XXVIII?

The CHAIRMAN. The chair understood such consent to be given;

but if any gentleman desires to object he can do so now. [A pause.] The Chair hears no objection.

The Clerk read as follows:

5. Unfinished business having been disposed of, it shall be in order to entertain a motion that the House do now proceed to dispose of the business on the Speaker's table, which, prevailing, the Speaker shall dispose of in the following order:

First. Messages from the President and other executive communications.
Second. Messages from the Senate and amendments proposed by the Senate to bills of the House.

Third. Bills and resolutions from the Senate on their first and second reading, that they be referred to committees or put on their passage; and the motions so to refer shall have precedence of all other motions touching their disposition.

Fourth. Engrossed bills and bills from the Senate on their third reading.

Mr. HAWLEY. That is not elegant. "Unfinished business having been disposed of, it shall be in order," &c., then "to dispose of the business upon the Speaker's table." Say "the House shall now proceed to the business upon the Speaker's table."

Mr. BLACKBURN. I do not hear the gentleman from Connecticut.

Mr. HAWLEY. I am suggesting a verbal correction in the second line of this clause, so it shall read, "the House shall now proceed to the business upon the Speaker's table," instead of saying, "to entertain a motion that the House do now proceed to dispose of the business on the Speaker's table." The word "dispose" is used three times where it is unnecessary.

Mr. FRYE. That is all right.

Mr. BLACKBURN. Very well; let the amendment be made.

The amendment was agreed to.

The Clerk read as follows:

6. Business on the Speaker's table having been disposed of, it shall then be in order to entertain motions in the following order, namely:

First. That the House resolve itself into the Committee of the Whole House on the state of the Union to consider, first, bills raising revenue and general appropriation bills, and then other business on its Calendar.

Second. To proceed to the consideration of business on the House Calendar.

Third. On Friday of each week, after the morning hour, it shall be in order to entertain a motion that the House resolve itself into the Committee of the Whole House to consider business on the Private Calendar; and, if this motion fail, then public business shall be in order as on other days.

Mr. WHITE. I move to amend the third division of this sixth clause, as follows:

Friday in every week shall be set apart for the consideration of private bills and private business, in preference to any other, unless otherwise determined by a majority of the House.

That is identically the old rule known as Rule 128. That is specific and well understood by repeated interpretations in this House. The difference between that and the proposition reported by the committee is, that the proposition reported by the committee makes it in order every Friday after the reading of the Journal for the Speaker to entertain a motion to go into the Committee of the Whole for the consideration of the Private Calendar. There it stops. The practice hitherto and as now understood under the old rule is to give private business preference all the time.

Mr. BLACKBURN. Will the gentleman allow me to ask him a question?

Mr. WHITE. Certainly.

Mr. BLACKBURN. If the gentleman will look on the same page to Rule XXVI, I will ask him whether that does not meet his objection. That rule provides that Friday in every week shall be set apart for the consideration of private business, unless otherwise determined by a majority of the House.

Mr. WHITE. I see that if this proposition is adopted it will do away with the necessity for Rule XXVI.

Mr. BLACKBURN. I call the gentleman's attention, if he will allow me, to the fact that this is the third division of the sixth clause of the twenty-fourth rule which he is now proposing to amend. We are not determining the right of that character of business on Friday, but simply describing here the order of business. The committee thought it was of sufficient importance to give one separate independent rule to the priority of private business on Friday.

Mr. WHITE. The gentleman will observe that the verbiage of this clause of the rule will be the rule of proceedings for the House, and it is somewhat in conflict with the provisions of Rule 128. Why the necessity of changing a rule which is so well understood and which has been so thoroughly administered here?

Mr. BLACKBURN. We mean to do the same thing the gentleman proposes.

Mr. WHITE. I withdraw my amendment.

Mr. CALDWELL. After the word "and," in the fourth line of clause 3, insert the following:

If this motion prevail, on each alternate Friday pension bills on the said Calendar shall have precedence in consideration.

I simply desire to say that amendment is offered by direction of the Committee on Invalid Pensions. It is a well-known fact to the members of this House that fully one-half, if not more, of the private bills which go on the Calendar are pension bills either for increase of pension or in the nature of an appeal from the Pension Bureau. If it is the purpose of this House to give to those bills a fair opportunity to be passed, then, it occurs to the committee, it is but right to give to them the precedence at least two Fridays in the month. That is the view of the committee on the subject, and that is the reason we have offered the amendment.

Mr. WHITE. How will it read then?

The CHAIRMAN. The Clerk will report the clause as it will read if amended.

The Clerk read as follows:

Third. On Friday of each week, after the morning hour, it shall be in order to entertain a motion that the House resolve itself into the Committee of the Whole, House to consider business on the Private Calendar; and if this motion prevail, on each alternate Friday pension bills on said Calendar shall have precedence in consideration. If this motion fail, then public business shall be in order as on other days.

Mr. WHITE. I was going to make this remark: I am opposed to the amendment offered by the gentleman from Kentucky. I understand the motive which prompts him to offer this amendment. He states that it comes from the Committee on Invalid Pensions. All right, and then the pension claims of soldiers appeal to our every sense of gratitude and magnanimity. But I will remind that gentleman and the House that pension bills are not the only ones that come here and which go on the Calendar in which we are called upon to relieve soldiers. The experience of every gentleman who has been here for two years is that there are quite as many bills relating to back pay and mustering out or for removing some disability of soldiers as there are for pensions, and I submit that if we give this Pension Committee the privilege here asked for, it should be extended to all these other classes of claims to which I refer.

Mr. CALDWELL. I would suggest to the gentleman that he prepare an amendment to include what he desires. I have no objection to it.

Mr. WHITE. Then I will offer to amend by inserting the words "or for the relief of soldiers."

Mr. WARNER. Mr. Chairman, I think that any amendment of this kind must be entirely unavailing for the accomplishment of the object which the gentleman has in view in proposing it. If this House should do no other business from now until the end of the session—indeed, Mr. Chairman, if we should sit here from now until the first Monday of December next, and devote three hours a day every day to the consideration of the pension bills now pending before the two Houses of Congress and give ten minutes to each case, we could not get through the list. Even if we gave but five minutes' consideration to each one of these cases, and if we sat here for four months and did no other business, we would be unable to get through with the pension claims alone.

Now, I suggest, therefore, to the gentleman who represents the Committee on Invalid Pensions in offering this amendment, that some other means should be adopted for disposing of these cases than by the method which he proposes. It is due to this House, and it is due to those who are entitled to pensions and who should long ago have had their pension dues, that some better mode of disposing of these claims should be adopted than that offered here.

Mr. STEVENSON. I would like to ask the gentleman from Ohio what other plan than the one suggested by the amendment offered by the gentleman from Kentucky he would propose?

Mr. WARNER. I will answer the gentleman.

Mr. STEVENSON. I would like to have the gentleman suggest a plan or present a motion by which these bills can be disposed of in the speedy manner he wishes.

Mr. WARNER. Then I will suggest one, because I think the plan proposed here in this amendment is entirely inadequate. I think there should be a commission constituted to which all of these appeals from the decision of the Commissioner of Pensions should be referred, and only such cases brought before Congress as are not covered by the general law, but at the same time are clearly equitable.

The idea, Mr. Chairman, that this House, composed of two hundred and ninety-three members, paid \$5,000 a year each, to sit here as a court of appeals to consider cases brought from the Pension Bureau, making of this House a mere appendage to that bureau, is in my opinion simply ridiculous.

Why, if we should give fair consideration to pension cases, give the time that it would seem ought to be given to them, we could not get through this session with the cases that are now on the Calendar from Pennsylvania alone. We might perhaps then reach Indiana next session and some other State three or four years hence; or we might take in a few from each of the States and leave the rest out, as we inevitably must under this system. Moreover, Mr. Chairman, at best, while we proceed in this way we do but poor justice. Rather I think we do much injustice. A claim is presented, for instance, for an increase of pension for a certain disability and it is granted, but there may be and probably are, one, two, or five hundred like cases. But only the one who has pressed his claim to a consideration here or who has been fortunate enough to get it on the Calendar gets the increase, while his comrades, equally worthy, are left without it. Such cases should be classified, and if deemed right to give an increase of pension, all of a class should have the same benefits, all should be treated alike.

I think, therefore, this amendment ought not to be adopted, but that a commission of some kind should be established to which an appeal can be taken, and by which all such cases as are now brought here may be considered and be judicially determined, and at the same time those who are not entitled to pensions and all fraudulent claims be kept out. That would not only be in the interest of economy, but in the interest of all meritorious soldiers who are claimants for pensions.

Mr. COFFROTH. I would like to ask the gentleman how many cases there are from Pennsylvania now on the Calendar?

Mr. WARNER. If you were to devote but a very short time to the consideration of each one and call the roll on its passage, as proposed in the new rules, there is no knowing when you could get through with them. Suppose a half hour's consideration to be given to each case, including roll-call, where would we be?

Mr. COFFROTH. The gentleman thinks that all the cases reported by the chairman of that committee came from the State of Pennsylvania; but he is mistaken.

Mr. WARNER. I said no such thing; the gentleman has entirely misunderstood me. I do say this House cannot get through, with the consideration they ought to have, the cases that are on the Calendar from a single State, and that is reason enough why the system should be changed.

Mr. COFFROTH. From his own State one of his colleagues put in one hundred and eight petitions at one time; and the gentleman from Ohio ought not to complain about any other State.

Mr. WARNER. I am making no complaint about that State, but say that we cannot reach them all in five years the way we are doing.

Mr. STEVENSON. Mr. Chairman, I rise to support the amendment offered by the gentleman from Kentucky, [Mr. CALDWELL.] This amendment was proposed under instructions from the Committee on Invalid Pensions, and, I trust, will receive the sanction of the House. It is well known, sir, that a large number of meritorious bills granting pensions are now upon the Private Calendar. These bills are continued from week to week for the sole reason that under the present rules, and with the various interests of a great country pressing upon us, we have no time to consider them. The House has shown no disposition to reject any of these bills when reported by the committee, but they remain upon the Calendar undetermined for the sole reason, as I have said, that there is no time to pass them.

Now, sir, let us pass this important amendment to the rules. Let a time be set apart exclusively for the consideration of bills of this character. However important other legislation may be, there is none which imposes upon us an obligation more sacred than this. No obligation can rest upon this Government so nearly affecting its honor as that which it owes to its soldiers. The first duty of the Government is to its defenders.

As is well known, Mr. Chairman, many applications of a meritorious character have been rejected by the Commissioner of Pensions because of a failure of the applicant to comply with the strict regulations of the Department in the matter of proof. In many instances such compliance was impossible, and the applicant for a pension, maimed and crippled though he be, is turned away empty. The vexatious delays in our Pension Department have become a reproach to our country. Turned away from the Pension Department upon a technicality, the only hope of the applicant is in an appeal, not to the mercy, but to the justice of Congress. This can only be meted out by special acts.

But, sir, what avails the diligent labors of the Committee on Invalid Pensions if the bills they have considered and reported upon favorably are to find a grave upon the Private Calendar of this House?

Mr. WARNER. Will the gentleman allow me to interrupt him? I yielded to him.

Mr. STEVENSON. I yield to the gentleman.

Mr. WARNER. Will the gentleman inform us how these claims are considered by the Committee on Pensions? What I said respecting the consideration that could be given all these claims by the House applies also to the consideration that can be given to them by the committee. The committee itself cannot give ten minutes to a case and get half through the list this session.

Mr. STEVENSON. In reply to my friend from Ohio, I will say that I assume and the House assumes when a bill is reported with a favorable recommendation by a committee, that such bill has received the attentive consideration of that committee. The business of this House could be done upon no other hypothesis.

The question before us is a practical one. I concede the difficulty, even under the most liberal rules, of considering all of the pension bills which may come before us. But the duty imposed upon us is imperative—is one from which we cannot escape.

The gentleman from Ohio insists that it is impossible for this House to pass judgment upon all of the pension bills upon its Calendar. If so, then, sir, let a commission be established by Congress as a final arbiter between the soldier and his Government, to which all applications of this character can be carried—a tribunal unfettered by the merciless technicalities of the Pension Department, but one whose aim, and only aim, shall be justice.

[Here the hammer fell.]

Mr. REAGAN rose.

The CHAIRMAN. Debate on the amendment is exhausted. The gentleman from Pennsylvania [Mr. WHITE] has moved to amend the amendment of the gentleman from Kentucky, [Mr. CALDWELL.]

Mr. CALDWELL. I accept the amendment of the gentleman from Pennsylvania.

Mr. REAGAN. I move to strike out the last word. It seems to me it is a strange procedure to assume that the Congress of the United States shall undertake to give special preferences to any particular class of meritorious claims pending before it. Are we to assume that the particular class of claims referred to have higher merits than those of the various other claims that come before Congress? The whole arguments that have been made tend to show that if Congress is to act

upon these claims promptly and satisfactorily it can do nothing else, and they tend to the conclusion which many have reached long ago, that for the settlement of this question there ought to be a special tribunal organized that should consider claims whether for increase of pension or in the form of appeals from the Commissioner of Pensions. If speedy justice is to be done to the claimants and if justice is to be done also to the Government, that is the mode, it seems to me, gentlemen should pursue who desire to obtain it, instead of converting Congress into a commission for the determination of one class of claims upon its equity and comity in preference to others. It seems to me such a rule as is now proposed would be anomalous, unjust in its character, and improper, and I trust it will not be adopted.

Mr. FINLEY. I desire to occupy the attention of the committee for just one moment. I am in favor of the amendment of the gentleman from Kentucky, [Mr. CALDWELL.] I believe that precedence should be given to this class of bills. We have but one day in the week on which appeals of this class can be considered; and on Friday a fortnight ago, when the House was in Committee of the Whole on the Private Calendar, we observed that a few gentlemen making objections delayed or entirely prevented the passage or consideration of every bill that was read.

Mr. WARNER. They could not be considered on that day.

Mr. FINLEY. They could have been considered but for the objections of a few gentlemen made to their consideration.

Mr. WARNER. It was objection day.

Mr. FINLEY. I know it was objection day, and those bills would have been passed but for the objection of those gentlemen, for which they assigned no reason except that the bills were in the nature of appeals from the decisions of the Commissioner of Pensions.

I see no good reason why if a soldier believes he has not had full justice done him by the Commissioner of Pensions, after having his petition or case considered by the proper committee of this House, and a favorable report made upon it—I see no good reason why this House shall not consider it, and why this class of cases should not be given precedence over other classes.

Mr. REAGAN. I withdraw the formal amendment.

Mr. RANDALL, (the Speaker.) I renew it. I have every sympathy with the object in view as proposed by the Committee on Invalid Pensions; but I am not clear in my own judgment whether it is not better to leave pension cases to the magnanimity of the House. And I want to say here, to the honor and credit of every Congress in which I have served, there never has been any objection to giving special meetings for the consideration of pension bills.

Mr. CALDWELL. Was there not an objection to that the other day?

Mr. RANDALL, (the Speaker.) There was a single objection the other day; but immediately the Committee on Invalid Pensions came into this House and asked and got the opportunity to offer a motion to suspend the rules so as to give them a special sitting; and I do not believe there would have been ten votes in this House against the proposition to give to the Committee on Invalid Pensions an opportunity of presenting their bills and having them passed at a special session of the House.

Mr. COFFROTH. Was not a motion made to defeat that?

Mr. RANDALL, (the Speaker.) No, sir; I do not think that was the motive which caused the objection. On the contrary, I think a very different motive was at the bottom of the motion to adjourn, although I am not permitted to judge of men's motives.

Mr. COFFROTH. Did the motion to adjourn not defeat it?

Mr. RANDALL, (the Speaker.) It did not, because on Monday next it will be again reached. I repeat I would rather trust to the magnanimity of the House to pass pension bills. I have seen as many as twenty pension bills passed in the House—coming with favorable recommendation from the Committee of the Whole—passed in two minutes, and have known as many as one hundred and fifty pension bills to pass in a single evening session. It is better to trust to the generosity of the House than tie down its action by technical rules in doing justice to maimed soldiers of the Union Army.

Mr. ROBINSON. I would like to make a suggestion.

Mr. RANDALL, (the Speaker.) Certainly.

Mr. ROBINSON. I would suggest to the gentleman that if we shall proceed under the rule as amended yesterday, and call the yeas and nays on everything requiring an expenditure of money, we will not be able to pass many private bills.

Mr. RANDALL, (the Speaker.) When the House shall come to consider that proposition, if it shall incorporate it into the rules, the gentleman's criticism would be a just one. But it has not been adopted by the House.

Mr. ROBINSON. It has been adopted by the Committee of the Whole.

Mr. RANDALL, (the Speaker.) And even then we could except pension cases. But I really think it would be a great deal better for us to hold special sessions for the consideration of pension bills than to rely upon any particular day in the month, or perhaps two days in a month, for the consideration of such bills. I think, therefore, that in the interest of speedy action on pension bills, in the interest of maimed soldiers, it would be better not to change the rule.

Mr. WARNER. Will the gentleman allow me to ask him a question?

Mr. RANDALL, (the Speaker.) Certainly.

Mr. WARNER. If pension bills are to be passed in the manner in

which the gentleman has stated they have been, a hundred in a few minutes—

Mr. RANDALL, (the Speaker.) No, sir; I said twenty in two minutes, and one hundred and fifty in one evening session.

Mr. WARNER. Even at that rate, would it not be better simply to say that we will at once add one thousand, or two thousand, or ten thousand names to the pension-roll, and let the committee, or some member of it, fill up the list?

Mr. RANDALL, (the Speaker.) I would do so, if the recipients are entitled to pensions and the Committee on Pensions so stated in their report. I would pass them as quickly as I could.

Mr. WARNER. So would I; but I would not have two hundred and ninety-three members of this House turned into a court of appeals for that purpose. That is not the way these cases should be passed upon.

Mr. WEAVER. Why not pass my soldiers' bill, and so settle the whole matter?

Mr. McMAHON. I desire to add my testimony to that of the Speaker of this House in regard to the favorable disposition of every House of which I have been a member toward our soldiers. I think I am correct in the statement that when the last House adjourned there were not fifty pension cases upon the Calendar undisposed of. The House had, by unanimous consent, set apart so many evening sessions for the consideration of pension bills that they were all disposed of, as I may say, with lightening speed, as my friend has intimated.

I want to say to my colleague [Mr. WARNER] that if he will consider the manner in which pension cases are passed upon by the Department, I cannot see why he should give to the decision of that Department any peculiar presumption which may not be overcome by the report of our committee. We all know that it is not the Commissioner of Pensions who passes upon these claims. He refers them to this clerk and to that clerk, to this division and to that division, and they are investigated by persons who, many of them, are not qualified at all to weigh testimony; by men who have become accustomed, as it were, to cut down the expenses of the Government, and who are always upon the side of the Government. If there is to be any presumption at all given to the conclusion of any tribunal I would rather take the conclusion of our Pension Committee as a final result.

I would also say to my colleague that when it comes to the question of money, to the question of giving the soldier his pension, back-pay, or bounty, I for one have always been willing to accept the report of the committee, if upon the face of the report the case appears to be a meritorious one. I have always been willing to accept that report as a final adjustment of the case, and always will be, until some other course is adopted; for instance, until there is established in this District a tribunal of three or five judges to consider these claims. And after all, who will they be? They will be but men. And in this House we have a committee of eleven or fifteen members to consider such cases.

Of course, we understand that these pension claims are referred to individual members; but they report to the whole committee which passes upon their reports. It may be that there is a little looseness in regard to this matter; but I would rather see looseness on the side of the soldier than against him. It has been the policy of this Government, ever since its foundation, to pension every man engaged in any of our great wars, after the lapse of a certain period of years from the close of that war.

Mr. BLACKBURN. It has not been done in regard to the soldiers of the Mexican war.

Mr. McMAHON. Such a bill as that has passed this House, and if it were not for the political questions which our friends on the other side are so much in the habit of bringing into the consideration of this subject, that bill would have become a law long ago.

Mr. RANDALL, (the Speaker.) I withdraw my formal amendment.

Mr. CALDWELL. I move to strike out the last word, for the purpose of saying that there is no doubt on the part of myself or any member in regard to the generosity of this House in reference to these pension bills. But there has been a disposition growing up, since the passage of the arrears of pensions bill, not only here, but on the part of distinguished leaders of both political parties elsewhere, to defeat as far as possible every bill introduced into this House that proposes to grant arrearages of pensions. The Speaker of this House, I understand, objects to the amendment I have offered.

Mr. RANDALL, (the Speaker.) Not to the object of it.

Mr. CALDWELL. I understand that; but he objects to my amendment for the reason, as he says, that we can have special night sessions set apart for the consideration of pension bills. The adoption of this amendment will not prevent that, but it will give us at least a fair opportunity to dispose of these bills.

There has been some criticism of the chairman of the Committee on Pensions [Mr. COFFROTH] in reference to the number of bills which he himself has reported. I will say in justice to him, and he deserves it, that he spent his time here in this city when the other members of the committee were at home with their families, investigating the pension cases which had been referred to him by the committee. I do not know whether those cases were from his district or not; it was his duty to consider them. So far as I am concerned I am willing to report to this House every meritorious case referred to me, whether it come from Kentucky, Maine, or Kansas. I believe, as the gentle-

man from Ohio [Mr. McMAHON] has said, that it is right and proper to pass these bills, and if we err let us do so on the side of mercy.

Mr. BAKER. If in order I desire to move an amendment of substance, not one merely formal. I move to strike out the words "every other Friday," and to insert the words "every Friday." I had occasion the other day to say something on this question. I desire to say now that, in my judgment, the opposition to the adoption of the amendment proposed by the gentleman from Kentucky [Mr. CALDWELL] arises from a disposition to give preference to other private claims over the claims of soldiers to pensions.

It is a well-known fact—and I appeal to every member of this committee to bear testimony to that fact—that the great consumption of time in the consideration of private business which has been complained of arises upon claims of a questionable character, which provoke long and oftentimes acrimonious discussion, oftentimes debate of a bitter political character. The result of having the business on the Private Calendar so arranged that these questionable claims may be brought up for discussion in preference to other claims will undoubtedly result in delaying pension bills, so that even if they shall finally pass the House they will go to the Senate so late in the session that they will sleep there the sleep of death. I believe it is the duty of this House to so arrange its rules that speedily and without delay every pension bill that is reported from the Committee on Invalid Pensions may be disposed of.

If such pension bills are given precedence, my experience in this House for the last five years justifies me in the declaration that no considerable time will be consumed in their discussion and determination. Each Friday we can, within half an hour, dispose of all the pension bills which may have been reported in the course of the week, and then we will be ready to go on, if we desire, with these old, stale, and ancient claims on the Private Calendar, which have brought so much shame and reproach upon preceding Congresses.

I submit that if we shall so amend the rules that on each Friday, upon the first call of the Calendar, all the pension bills reported during the week previous can be considered and disposed of, it would not take more than half an hour to dispose of them all, and the rest of the time can be devoted to other matters.

Mr. BLACKBURN. Believing that we have had about enough discussion on this clause, I will now move that the committee rise with the view of obtaining from the House an order limiting debate upon this clause.

Mr. GARFIELD. Let us have a vote upon it now?

Mr. BLACKBURN. If we can get unanimous consent to vote upon the amendment without further debate, I will not press my motion. [Cries of "Vote!" "Vote!"]

The CHAIRMAN. The Chair will entertain the motion that the committee rise; but before putting the question upon it will call the attention of the gentleman from Indiana [Mr. BAKER] to the form of the amendment which he has offered. The gentleman moves to strike out the words "every other Friday" and to insert the words "every Friday." There are no such words in the amendment pending. The words in the amendment proposed by the gentleman from Kentucky [Mr. CALDWELL] are "on each alternate Friday."

Mr. BAKER. Then I move to strike out the words "each alternate" and to insert the word "every."

The CHAIRMAN. If the word "alternate" be stricken out, the amendment will then read "each Friday."

Mr. BAKER. I will make that motion.

Mr. GARFIELD. Why not strike out "Fri—," so that it will read "each day?"

Mr. HAYES. Is a substitute for the amendment now in order?

The CHAIRMAN. Nothing is now in order, except the vote upon the motion made by the gentleman from Kentucky that the committee now rise.

The motion of Mr. BLACKBURN was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had had under consideration the proposed revision of the rules reported from the Committee on Rules, and had come to no resolution thereon.

Mr. BLACKBURN. I now move that the House resolve itself into Committee of the Whole on the state of the Union for the purpose of resuming the consideration of the report of the Committee on Rules, and pending that motion I move that all debate upon the pending clause of Rule XXIV and all amendments thereto be limited to five minutes.

Mr. GARFIELD. Say one minute.

Mr. BURROWS. That of course relates only to pending amendments.

Mr. BLACKBURN. My motion relates to all amendments, pending and that may be offered.

Mr. BURROWS. Is it in order to limit debate on amendments not yet offered?

Mr. TOWNSHEND, of Illinois. Will the motion of the gentleman from Kentucky, [Mr. BLACKBURN.] if adopted, cut off debate upon any new clause that may be offered?

The SPEAKER. It would not. In the absence of objection, the House might agree to tie itself up by cutting off debate on all amendments to be offered; but that would have to be done by unanimous consent.

Mr. BLACKBURN. I mean all amendments to the pending clause.

Mr. BURROWS. On all pending amendments.

Mr. BLACKBURN. I am making my own motion.

Mr. BURROWS. Yes; and I am making my objection to it.

Mr. BLACKBURN. That you may do by your vote.

The SPEAKER. The rule only allows the cutting off of debate on pending amendments if there is objection.

Mr. BLACKBURN. Is that the practice of the Chair?

The SPEAKER. The Chair has ruled on that point.

Mr. BLACKBURN. Has that been the ruling of the Chair?

The SPEAKER. It has. The Chair has made that ruling since this report from the Committee on Rules has been pending.

Mr. BLACKBURN. Very well; then I modify my motion so as to limit debate upon the paragraph and pending amendments to one minute.

The motion was agreed to.

Mr. BLACKBURN moved to reconsider the vote by which the motion was agreed to; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. BLACKBURN. I move that the House resolve itself into Committee of the Whole to resume the consideration of the revision of the rules.

The motion was agreed to.

The House accordingly resolved itself into Committee of the Whole, (Mr. CARLISLE in the chair,) and resumed the consideration of the report of the Committee on Rules.

The CHAIRMAN. By order of the House all debate on this paragraph and pending amendments is limited to one minute.

Mr. WHITE. I have modified my amendment in such a form as I think will still be acceptable to the gentleman from Kentucky. I ask that it be read.

The Clerk read as follows:

If this motion prevail on each alternate Friday pension bills or private bills for the relief of persons who are or have been soldiers, for causes growing out of their military service, on said Calendar, shall have precedence in consideration.

The CHAIRMAN. Does the gentleman from Kentucky [Mr. CALDWELL] accept this amendment as modified?

Mr. CALDWELL. I do.

Mr. BAKER. With the permission of the Committee of the Whole, I withdraw my amendment.

Mr. WARNER. Mr. Chairman, in the minute I have I wish to call attention to the fact that the pensions already granted if capitalized would amount to a debt of a thousand million of dollars, and is destined even under the law as it now stands to reach a sum much larger, at least for a time, requiring about \$40,000,000 annually; and if it be intended, as has been intimated, to open wide the doors and let in every one who has served at all in the Army, then let us be honest and say so at once. We must be prepared, however, if we do that to see from seventy-five to a hundred millions of dollars taken annually from the Treasury to meet it, and taxes increased accordingly. Such a pension-roll as that step would lead to would, if capitalized, amount to more than the present national debt. On the other hand, if these cases are to be examined and relief limited to actual disability under the law, then I insist that our method of proceeding is a sham and a farce. It is utterly impracticable as all know to go over in this House and pass decently on even three hundred cases this session out of three thousand, and all others must be put off to another session, while to the Calendar is all the time being added ten cases to one that is disposed of.

Now, the Committee on Invalid Pensions can bring into the House and have passed a measure by which all this difficulty may be remedied, so that the soldier who has wounds and scars or other actual disability to show for it can get his pension dues without waiting till he is ready to die, and at the same time claims that are without merit, mere pretenses or wholly fraudulent, can be kept out. This is what as business men we ought to do.

[Here the hammer fell.]

Mr. HAYES. Is it in order to offer a substitute for the amendment of the gentleman from Kentucky?

The CHAIRMAN. It is.

Mr. HAYES. I offer the following:

After the word "and," in the third clause of the rule, insert "bills relating to pensioners and for the relief of soldiers and their representatives shall be considered in preference to any other."

This includes the cases of soldiers' widows and orphans who are not covered by the other proposition.

Mr. MAGINNIS. That would rule out bills reported from the Committee on Military Affairs to correct a soldier's record or anything of that kind.

Mr. WHITE. As I understand the amendment of the gentleman from Illinois, [Mr. HAYES,] it is confined to men now in the service.

Mr. HAYES. Oh, no.

The question being taken on the amendment of Mr. HAYES, it was not agreed to.

The question being taken on the amendment of Mr. CALDWELL as modified by the acceptance of the amendment of Mr. WHITE, there were—ayes 64, noes 74.

Mr. WHITE called for tellers.

Tellers were ordered; and Mr. CALDWELL and Mr. BLACKBURN were appointed.

The committee divided; and the tellers reported—ayes 76, noes 78. So the amendment was not agreed to.

Mr. OSCAR TURNER. I move the following amendment. The Clerk read as follows:

Add to Rule XXIV the following:

When a public bill, resolution, or proposition shall have been referred to a standing or select committee of the House and no report has been made thereon for thirty days, it shall be in order for the member who introduced said bill, resolution, or proposition, on any Monday, after the call of the States and Territories for bills and joint resolutions, to offer a resolution or move to place said bill, resolution, or proposition on the proper calendar, which resolution shall then be considered, and, if decided in the affirmative, the bill, resolution, or proposition shall be placed on the Calendar, and the committee discharged from further consideration of the same.

Mr. OSCAR TURNER. Mr. Chairman, I offer that amendment in accordance with the notice I gave several weeks ago, as a remedy for an evil which I think exists, and which perhaps has escaped the observation of the Committee on Rules.

It is the undoubted right of every member upon this floor to offer a bill to redress any public grievance or for the public good when he comes here as a Representative. When he offers such a bill, under the rules it is referred to a committee. I take the incontrovertible position that when it is referred to a committee it is the duty of that committee to report the bill in some way, either to report it back favorably or unfavorably. But, instead of that being done, there are many instances which have occurred, and which are complained of, where bills have been referred to committees, and because the committees seemed to be opposed to them, they have refused to make any report on them whatever—either for or against them. In this way the bills are smothered. This is all wrong. It is one of the highest privileges of a member upon this floor to have a vote of this House upon any measure he presents for the public good. Well, how is he to get it if the committee refuses to report the bill at all? How can you force a committee under these rules to do it? If any gentleman will point out a remedy now existing I will withdraw my amendment.

But I have talked with old parliamentarians, with men as thoroughly versed in parliamentary rules, perhaps, as any gentleman upon this floor. They all agree upon one point, that if a bill is referred to a committee which is opposed to it and that committee does not see proper to report the bill back to the House, they can hold it up, and the only remedy is for a member to offer a resolution of this House instructing that committee to report back the bill. Now, at first blush, that would seem to be a proper remedy. But it amounts to nothing at all, because a member can never offer such a resolution or make such a motion except upon a Monday, after all the States and Territories have been called through for the introduction of bills and joint resolutions, before the expiration of the hour, and when during the remainder of that hour a second call is made for individual resolutions. I have been assured by members who have been upon this floor for the last twelve or fifteen years, that they never knew an instance of such a call to occur except once, and then when a motion was made it was lost by the interposition of a motion to adjourn, because it had no place on the Calendar and no place provided for it under the rules of this House.

Under the provision of the amendment I have offered, if a committee has had a public bill for thirty days and refuses to make any report on it, *not a private, but a public bill*, then the member may enter a motion on Monday, after the call of States and Territories has been completed, to put that bill on the Calendar, and that motion is then to be considered by the House, and, if they approve of it, it goes upon the Calendar; if not, that is the end of it. It seems to me it is a just and equitable provision. It is the only remedy I can conceive of.

Mr. Chairman, this amendment not only protects the rights of individual members on this floor, but it protects the rights of the majority, and prevents the will of the majority from being stifled and smothered by a committee. How can this House exercise its legislative functions except by a bill or joint resolution offered by some member? It is immediately referred to a committee, and the House cannot act upon that bill and give its sanction to it, no matter if there is a large majority in favor of it, until it is reported back by the committee either favorably or unfavorably; and if the committee is opposed to the bill and will not report it, they not only defeat the right of the member offering the bill or resolution, but they stifle and smother the voice of a majority of the representatives of the people. I assert, sir, that under the rules of this House as reported and as they are to-day in force a committee can exercise an unconstitutional power by withholding a bill which has been referred to them and which a majority is in favor of, and by this means prevent the will of a majority from being carried into a law for the public good. This is clearly contrary to the spirit of our Constitution, and yet it has been done and can be repeated. No such power ought to be in the hands of a committee; it is dangerous to the liberty of a free people. There ought to be some remedy provided such as I propose in this amendment. The will of a majority should control in this House, and it ought not to be in the power of any committee to stifle it, as it is under the present rules and those under consideration. The Constitution does not require two-thirds to pass a bill; a majority has the right under the Constitution, and the rules ought not to obstruct the will of a majority, or put it in the power of a committee to do it.

Sir, I believe in the doctrine of "equal rights to all, exclusive privileges to none." I hope the House will adopt the amendment.

[Here the hammer fell.]

Mr. TOWNSHEND, of Illinois. I offer this as an amendment to the amendment now pending.

The Clerk read as follows:

Strike out the words "after call of States and Territories for bills and joint resolutions," and insert "immediately after the expiration of the morning hour."

Mr. TOWNSHEND, of Illinois. Mr. Chairman, it will be observed the amendment offered by the gentleman from Kentucky [Mr. OSCAR TURNER] is applicable only to public bills and joint resolutions, and not to bills of a private nature. The number of public bills is not so very large as many may imagine. Most of those introduced here are private bills. Therefore I do not believe this rule will be impracticable.

I have been here long enough, sir, to have learned the necessity for some such provision as this. I have known very important measures of a public nature brought in at an early day during the last Congress, which have been ignored by the committees to which they were referred, while they have instead devoted their time to the consideration of private bills. I know of some bills of a public nature which have been introduced into this Congress at the extra session and referred to important committees of this House, having proper jurisdiction of them, and which have never yet been daylight so far as any report to this House is concerned, while the same committees nearly every time they have been called for reports have reported private bills, showing that considerable labor and care had been bestowed by the committees upon them.

Now, sir, I am one of those who believe that legislation should be of such character as will promote the greatest good to the greatest number, and that private bills should give way to public necessity. This amendment, in my judgment, would be in furtherance of that principle.

I can particularize many instances, but will content myself with reference to only one or two. Before the holidays I introduced into this House a resolution directing the Committee on the Judiciary to report an amendment to the Constitution fixing a limit of six years for the presentation of claims against the Government of the United States. When we remember the fact that there are bills now pending in this Congress which have been introduced into every Congress since 1819—and although some of them have time and again been reported upon adversely, they have been renewed in each recurring Congress and pressed again for action with a hope that they may slip through a new and negligent Congress—we can all see that if an amendment to the Constitution like that I suggested should be adopted, fixing a limit to the time for the presentation of these claims, it would settle forever the fate of many unjust and rotten claims and thereby save hundreds of millions of dollars in the future to the tax-payers of this country.

The old schemes to plunder the Treasury and the chronic claims will never die, for when death ends their prosecution by original claimants they are followed up by heirs, or by assignees, or claim-agent sharks, who have obtained control of them for insignificant sums. There is but one way to protect the people from such fraudulent or stale claims, and that is by the method I have suggested.

In another instance I introduced a resolution early in January instructing the Committee on Foreign Affairs to report upon the expediency of abolishing our useless diplomatic service. If a bill was reported from the committee for that purpose and passed by this House, we might in this Congress save over \$300,000, being one-third the cost of our consular and diplomatic service, and rid ourselves of envoys extraordinary and ministers resident and their expensive appendages.

The intelligent public has long been convinced of the utter uselessness of our ornamental diplomatic corps. The cable and the present extraordinary rapid mail transportation facilities have enabled the metropolitan press to advise the Government and the public of every movement of foreign governments much more fully and much more speedily than any of our foreign missions. Indeed, it has been conceded by some of the highest officials in the Executive Departments that we can with safety dispense with this service. This would not embarrass the transaction of business between our Government and people with foreign countries, for that will be as effectively conducted by our consular service.

I refer to these two cases merely as illustrations. Neither of these resolutions has ever been reported from these committees. Now, what I want to accomplish is to give committees a fair opportunity to consider bills and resolutions referred to them. If they deem them unwise, let them report to the House, in order that the author may have an opportunity of getting the sense of the House upon them. If they are wise and advantageous to the country, they should not be buried in the committees. When committees fail to give proper attention to such important measures, either from disinclination or because overcrowded with work, this amendment will enable others, who are either more industrious or have more leisure, to secure action upon them.

[Here the hammer fell.]

Mr. OSCAR TURNER. I accept the amendment.

Mr. BLACKBURN. This is a very important amendment offered by my colleague, and I think it best that the House should see it in

print to see what is its scope and the bearing it may have. I do not want any hasty action taken in any matter relating to this revision of the rules. If this amendment is adopted I think it will be found in the first place it is not as carefully worded as my colleague would like to have it. If it is adopted I think it will work an absolute revolution probably away beyond the scope he or any member of this House would propose to give it.

For that reason, Mr. Chairman, I will move now that the committee rise in order that this amendment may be pending when we shall meet to-morrow or when we next meet for the consideration of this revision of the rules.

The CHAIRMAN. The Chair will state before the committee rises that the gentleman from Kentucky has indicated his acceptance of the amendment of the gentleman from Illinois, as a modification of his.

Mr. OSCAR TURNER. I have accepted it.

The CHAIRMAN. It is now moved by the gentleman from Kentucky that the committee rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had, according to order, had under consideration the report of the Committee on Rules, and had come to no resolution thereon.

FEBRUARY 24, 1880.

REVISION OF RULES.

The SPEAKER. The gentleman from Kentucky [Mr. BLACKBURN] moves that the House resolve itself into Committee of the Whole on the state of the Union; and pending that motion he moves that all debate on the pending amendment be closed in five minutes.

Mr. BLACKBURN. The pending amendment is that offered by the gentleman from Kentucky, [Mr. OSCAR TURNER.]

Mr. CONGER. The motion, as I understand it, does not cut off further amendment.

The SPEAKER. It cuts off neither amendment nor debate on such other amendments as may be offered.

The motion to limit debate was agreed to.

Mr. BLACKBURN moved to reconsider the vote just taken; and also moved to lay the motion to reconsider on the table.

The latter motion was agreed to.

The motion that the House resolve itself into Committee of the Whole on the state of the Union was agreed to.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, Mr. CARLISLE in the chair.

The CHAIRMAN. The Committee of the Whole resumes consideration of the report of the Committee on Rules, and by order of the House all debate on the pending amendment is limited to five minutes. The pending question is upon the amendment proposed by the gentleman from Kentucky, [Mr. OSCAR TURNER,] as modified at the suggestion of the gentleman from Illinois, [Mr. TOWNSHEND.]

Mr. OSCAR TURNER's amendment, as modified, was as follows:

Add to Rule XXIV the following:

When a public bill, resolution, or proposition shall have been referred to a standing or select committee of the House and no report has been made thereon for thirty days, it shall be in order for the member who introduced said bill, resolution, or proposition, on any Monday, immediately after the expiration of the morning hour, to offer a resolution or move to place said bill, resolution, or proposition on the proper calendar, which resolution shall then be considered, and, if decided in the affirmative, the bill, resolution, or proposition shall be placed on the Calendar, and the committee discharged from further consideration of the same.

Mr. OSCAR TURNER. I offer a modification of the amendment which I offered on Friday last.

The Clerk read as follows:

Add to Rule XXIV the following:

When a public bill, resolution, or proposition shall have been referred to a standing or select committee of the House and no report has been made thereon for thirty days, it shall be in order for the member who introduced said bill, resolution, or proposition, on any Monday, immediately after the expiration of the morning hour, to offer a resolution or move to discharge the committee from the further consideration of the same, which resolution or motion shall then be considered, and, if decided in the affirmative, the committee shall be discharged, and the bill, resolution, or proposition shall be placed on a proper calendar, unless a majority of the House shall determine then to consider the same.

Mr. OSCAR TURNER. Mr. Chairman, as I have before presented my views to the committee on this amendment, I shall not trespass further than to simply say that there can be no abuse of the privilege given a member under this amendment, because it is to the interest of every member that he shall have the benefit of the report of a committee in his favor on any bill, resolution, or proposition referred to a committee, and no member will ever exercise the right given him under this amendment if the committee is engaged in investigating the matter. It will never be resorted to except when a committee refuses to report the bill back to the House, either favorably or unfavorably. In that event the remedy afforded by this amendment not only guards the personal right of the member who offers a bill or proposition, but, sir, it guards the rights of the majority of this House, for it secures to them the right to pass a bill or resolution if a majority are in favor of it, or to put it upon the Calendar. If this amendment is not adopted the power is left in the hands of a com-

mittee to stifle and defeat the will of a majority by refusing to report back to this House a bill, resolution, or proposition that has been referred to it.

If this amendment is defeated you give up the power of this House to legislate or pass a bill that a majority is in favor of, simply because a committee will not report back the bill, either favorably or unfavorably, that this House is in favor of which has been referred to it; thus recognizing in a committee a power dangerous to the liberties and rights of the people by leaving it in the power of a few members on a committee to stifle and defeat the will of a majority of this House, for under these rules there is no remedy provided to force a committee to report back a bill which has been referred to them.

Mr. Chairman, I offered this amendment because I knew it was important, and would, if adopted, enable us to legislate for the interest of the people.

I yield the remainder of my time to the gentleman from Indiana, [Mr. MYERS.]

Mr. MYERS. The power of the committees of this House has reached a point startling to all lovers of democratic government, and smacks strongly of the star-chamber and secret doings of the privy council. Measures of "great pith and moment" are even, when backed by a strong support of the people's representatives on this floor, consigned to premature graves without examination or the slightest regard to the wishes of their authors; and the whole power of this House under the existing rules and those that are proposed by the committee are unequal to the task of rescuing from the fatal pigeon-hole bills of the utmost importance to our constituents. We have heard much of the abuses of the veto power by the Executive, and yet we find members of this body who are most turbulent in their frothy assaults, the most clamorous for conferring powers upon a single committee which far exceed those of the veto power. The Executive can do no more than return a bill with his objections to the House in which it originated; but your autocratic committee may refuse to notice them at all, and say to this House, "You shall not even consider these bills; we do not think it proper to trust you with such matters, and we know more about the welfare of the country than all of you put together." I need scarcely remind gentlemen on this floor that at the late extra session a bill known as the "Warner silver bill" passed this House by a large majority, nor call to mind the humiliation to which they were subjected by the refusal of the chairman of a single committee of the Senate to even report the bill. And yet that very Senator was more violent in his denunciation of Mr. Hayes for his use of the veto power than perhaps any member upon the floor of either House; a terrible thing is this one-man power in the hands of the Executive of the United States, but a charming constitutional democratic affair when in possession of the chairman of a committee, especially if he happen to be chairman of the Committee on Appropriations.

But, sir, I am far from charging that the chairman of this most potent committee is more arrogant and self-sufficient than others, for they all seem to be tarred with the same paddle and to think the rest of us who are sent here to represent our constituents are a mere set of supernumeraries to hoist or let down the curtain when they so direct.

I had the honor at an early day of this session to present for the consideration of this House a bill to substitute national Treasury notes for national-bank notes, as a measure in which my constituents and the whole people of my State feel the deepest interest, and upon which I am anxious to have the views of members from other sections of the Union. But in calling on the high dignitary, the chairman of the great Committee on Banking and Currency, I was coolly informed that he did not intend to report it at all, though he confessed that he had never examined the bill, and then quoted other distinguished members of the committee in connection with himself as being opposed to any legislation upon national banks more than the bill that was so ignominiously set down on a few days ago in this House; and for no other reason, as I verily believe, than that the previous question was demanded and a free, full, and fair discussion refused by the gentleman who had the bill in charge. Sir, if we are to have no other agency in framing the laws of our country than to record the acts of the chairman of a committee, why not let us supernumeraries go home and save the expense of remaining in Washington and the shame of so servile a position in the Capitol of the American nation.

Sir, the people of my State are jealous of the one-man power, and I fear it will be difficult to convince them that its exercise in the hands of the chairman of a Senate committee, though he be a distinguished Senator from the State of Delaware, or the chairman of the Committee on Appropriations or of Banking and Currency in this House, possibly not less famous than the Senator, will be less liable to abuse or more democratic in principle than if exercised by a republican Executive.

The haughty disdain with which members of this House who seek a hearing before some of these committees are treated by the arrogant assumption of those who chance to fill the important position of chairman should remind us of the stern necessity imposed by self-respect to clip their wings and teach them that we have not yet abdicated the rights conferred upon us by an enlightened constituency—nor do we intend to transfer to their hands the sole power of framing our legislation.

I shall heartily support the amendment offered by the honorable member from Kentucky, [Mr. OSCAR TURNER.]

I say this, sir, in sorrow rather than anger, for I cheerfully confess the great improvements made in the general code of rules reported by the distinguished committee who have had charge of the matter.

Mr. BLACKBURN. I desire to say simply that I have no authority to speak for the Committee on Rules upon the subject of the amendment offered by my colleague, [Mr. OSCAR TURNER.] The scope of the amendment is very broad; its effect will be very noticeable. After a careful consideration of it from our adjournment on Friday last until now, speaking for myself and disclaiming any authority to speak for the Committee on Rules or any other member of it, I will say that I believe the amendment is in the right direction and should be adopted by the House.

Mr. UPDEGRAFF, of Ohio. I move to strike out the last word. I desire but a few moments to call the attention of the members of the Committee of the Whole to a matter which has been under consideration within the last few days. There was a statement made on Friday last which it seems to me does great injustice to the Committee on Invalid Pensions, great injustice to this Congress, and still greater injustice to unpensioned soldiers of this country. I for one am not willing that that statement should go out unchallenged to the people of the country. My colleague from Ohio [Mr. WARNER] in the discussion at that time said:

If this House should do no other business from now until the end of the session—indeed, Mr. Chairman, if we should sit here from now until the first Monday of December next, and devote three hours a day every day to the consideration of the pension bills now pending before the two Houses of Congress and give ten minutes to each case we could not get through the list.

Well, he seemed to warm up a little with his own eloquence and got stronger before he went on much further, for he said:

Why, if we should give fair consideration—

Now, I do not know what he considers "fair consideration." What he said was:

If we give fair consideration to pension cases, give the time that it would seem ought to be given to them, we could not get through this session with the cases that are now on the Calendar from Pennsylvania alone.

Mr. WHITE. Who said that?

Mr. UPDEGRAFF, of Ohio. My colleague, [Mr. WARNER.] Now there is one of two things pretty certain, either my colleague has been more successful with his pensioners—

Mr. TOWNSHEND, of Illinois. I rise to a point of order.

The CHAIRMAN. The gentleman will state it.

Mr. TOWNSHEND, of Illinois. My point of order is that the gentleman is not debating the amendment under consideration.

The CHAIRMAN. Of course it is impossible for the Chair to say in advance the relation that the remarks of the gentleman may have to the pending amendment.

Mr. UPDEGRAFF, of Ohio. I am coming to that in a few minutes.

The CHAIRMAN. It is a very difficult matter always for a presiding officer to rule in advance that what a gentleman is saying or may say has no reference to the pending proposition.

Mr. TOWNSHEND, of Illinois. It is a very easy matter for the Chair to rule in this case.

Mr. UPDEGRAFF, of Ohio. The gentleman from Illinois [Mr. TOWNSHEND] seems to have the floor a good deal of the time in order and out of order.

The CHAIRMAN. The gentleman from Ohio [Mr. UPDEGRAFF] will proceed in order.

Mr. UPDEGRAFF, of Ohio. I will endeavor to do so. There is one thing pretty certain, that my worthy colleague from Ohio, [Mr. WARNER,] having been successful himself in his own pension case, either considers these matters are not worthy of attention or else he has got into some very wild fiat inflation arithmetic, what might be called metaphorical arithmetic. He says "we could not get through this session with the cases that are now on the Calendar from Pennsylvania alone."

Sir, I hold in my hand the Private Calendar of this House. On that Calendar there are only thirty-two pension cases from Pennsylvania. There are on it fifty-two pension cases reported by the chairman of the Committee on Invalid Pensions, [Mr. COFFROTH,] only thirty-two of which are from Pennsylvania. Now, sir, if this House has not time to consider thirty-two pension cases, after having wasted weeks and months on moonshine inflation financial doctrines, it is about time that we should commence holding longer sessions than three hours a day. A day's work for a Government employé is at least eight hours.

In my judgment Congress has no duty that is now so binding, so imperative upon it, and so important to the people of the country as the consideration of these pension claims. Besides, the gentleman has figured it down very fine. He says that there have been introduced into this House, or into Congress, between three thousand five hundred and four thousand bills granting pensions. Are all these bills to come up for consideration? In a great number of these cases there will be found three bills in the House and one in the Senate, sometimes two in the Senate and one in the House, for the identically same pension. Therefore it does not make that many different cases. Again, a large portion of the cases before the Pension Committee are cases which year after year, and by committee after committee, have been reported adversely upon, and they need not and will not claim

the attention of this House. So that a few hundred are really all the cases that need claim the time of Congress.

But I will not consent that the disabled and still unpensioned soldiers of the Union Army shall be told that there is no chance for their claims to be heard, and, if just, allowed; shall be told, if these claims by reason of some technical defect in the evidence are rejected by the Pension Office, that this Congress is too august a body or too busy discussing theoretical finance—on which it has wasted weeks—to hear the claims for simple justice of the men without whose sacrifices we would to-day have no Congress, no Government, and no Treasury.

Within the last year the Pension Office has granted ten thousand pensions, eight thousand have been increased, and fifteen thousand "arrears." Congress, since 1862, has granted, by special acts, relief to fourteen hundred sufferers, and now it would require but a few weeks to settle every case worthy of attention. It has no work which is so much its duty; a soldier's claim is not a mere money title. It is not only justice, but appeals alike to the nation's honor and its pride.

Eighty-six years ago day after to-morrow this Government, under Washington, inaugurated the plan of sending pension claims to a committee of this House organized for that purpose, and has followed it ever since. Forty-nine years ago a Committee on Invalid Pensions, as now organized, was regularly charged with its present duties.

My colleague says he has a better plan. If it be such I will gladly accept it. But while this is the only mode known to our Government let us go faithfully forward in it to do what little we may of justice to the men and the families of the men by whose valor and sacrifices the nation marched to victory and peace.

[Here the hammer fell.]

The CHAIRMAN. The time of the gentleman has expired.

Mr. UPDEGRAFF, of Ohio. Well, there was a word or two more, but I will write out the rest as others do. [Laughter.]

Mr. WARNER. I wish to reply only to the arithmetic of my colleague from Ohio, [Mr. UPDEGRAFF.] I assumed that the report that the number of pension bills pending before this House and the Senate was between three and four thousand was correct. If there are three thousand, and ten minutes be given to each bill, it would take as I figure it, thirty thousand minutes to consider these bills alone. That would be five hundred hours, and supposing three hours a day be given to them, it would take one hundred and sixty-six days, and giving twenty days to a month, which is as many days as the House is in session on the average, it would take something over eight months. My arithmetic, therefore, was right.

Mr. UPDEGRAFF, of Ohio. How many days in a month do you say there are?

Mr. WARNER. I am calculating on the basis of twenty days in a month as the average number the House is in session.

Mr. UPDEGRAFF, of Ohio. You said "every day."

Mr. WARNER. Twenty legislative days in a month. It would take then about eight months to go over or pass three thousand pension bills, giving ten minutes only to each case. And there will be twice three thousand bills here before this Congress terminates, if it is understood that the time of the House is to be taken up in this way.

Mr. WRIGHT. What arithmetic is the gentleman referring to?

Mr. WARNER. I suggest to my friend from Pennsylvania that when he gets home he quietly take up his paper and pencil and figure this out for himself. I suggest that my colleague do the same.

Mr. UPDEGRAFF, of Ohio. I have done it.

Mr. WARNER. Mr. Chairman, I have no desire to make reply to anything further; but I still insist—

Mr. FRYE. The gentleman will allow me to call his attention to an inaccuracy in his statement of the time it will take to pass pension bills. The Committee of the Whole the other day, on motion of the gentleman from Kentucky [Mr. OSCAR TURNER] inserted in these rules a provision that not a dollar shall be appropriated by this House without a call of the yeas and nays; so that under this rule, as amended, it is going to take an hour to read the report and call the yeas and nays on every pension bill presented here. I simply call attention to this because it seems to me the amendment must be voted out when we get into the House.

Mr. WARNER. The rule, as I understand, does not apply to private bills, but only to public bills.

Mr. FRYE. I do not so understand it. I think it applies to all.

Mr. OSCAR TURNER. This amendment has no application to pension bills.

Mr. WARNER. I am informed that the provision referred to applies only to public bills, not to private bills.

I still insist that the rule proposed here the other day would be entirely inadequate as a means to correct the evils complained of. This House is not the place to consider pension claims. A commission ought to be established, and I hope will be, to decide such cases under the law; and if my colleague will permit me—and I mean no personal offense—I will say further that all this talk about rushing pension bills through here is in my judgment mere demagogism—not action dictated by wisdom or sound policy, or even good common sense. The object too manifestly is to catch votes and not to promote the real interests of honest pension claimants.

Mr. UPDEGRAFF, of Ohio. If anybody understands the demagogue business, I think it is my colleague. [Laughter.]

Mr. WARNER. I did not hear the remark of the gentleman. [Here the hammer fell.]

Mr. UPDEGRAFF, of Ohio. I withdraw the *pro forma* amendment. Mr. GARFIELD. I move to amend by striking out the last word.

Mr. FRYE. If the gentleman will yield to me one moment I wish to say that I find, on examining the amendment adopted on motion of the gentleman from Kentucky, [Mr. OSCAR TURNER,] that I am strictly correct; that on every bill appropriating money or making any charge upon the people the yeas and nays must be called.

Mr. GARFIELD. I rose to say a word in regard to the pending amendment, which I hope gentlemen will look at carefully before they vote. I do not wish to delay action at all, but the amendment if adopted will throw the entire business of this House, as I think, into the utmost confusion. According to this proposition any bill, after having been in committee thirty days, may, by a majority vote of the House, be brought back here for action.

Now, there are scores of bills that cannot possibly be taken up, properly considered, and carried through a committee in thirty days. No one of the appropriation bills, except the smallest, can be run through committee with any kind of thoroughness in thirty days. Take the bill on commerce, which the Committee on Commerce has been engaged upon for two months and more; it is not ready. Take the bill relating to rivers and harbors; that we understand takes the whole winter to get it ready. Take a bill covering all the subjects of a tariff; no Ways and Means Committee, though it be the most industrious that ever sat here, can bring in a general tariff bill in less than three or four months. Yet here is a rule that would tumble any bill, however great, however voluminous, however complicated, back into the House, out of the hands of the committee, and put it upon its passage or send it to the Calendar instantly, whenever a majority can be obtained to support such a course. Under such a rule we should have heart-burnings between committees, plots against committees, plots between committees in all sorts of ways. I trust that gentlemen who desire to have the good order of this House preserved, to have legislation proceed with the conservative surroundings and protections we have always had, will vote against this proposed rule.

Mr. BLACKBURN. May I ask the gentleman a question?

Mr. GARFIELD. Certainly.

Mr. BLACKBURN. I ask the gentleman from Ohio, in the light of his long service and elaborate experience, to tell me why a majority of this House should not have the right to send to a Calendar or consider, if it please, any bill that has been introduced into the House in accordance with the rules and has remained in the committee-room for thirty days?

Mr. GARFIELD. Simply because, as I have shown, there are scores of great bills that cannot be perfected in thirty days by any committee, however industrious.

Mr. BLACKBURN. Then make it sixty days.

Mr. GILLETTE. I desire to ask the gentleman from Ohio if in his judgment this House is not worthy to be trusted to decide by a majority vote what business they will consider?

Mr. GARFIELD. I think the old conservative rule requiring two-thirds to suspend the rules so as to discharge a committee—to turn the committee with its back to the wall and tell them "you are unworthy"—is a good rule to follow; and we do not want to run in tariff legislation in this way just now—which is the purpose.

Mr. BLACKBURN. Mr. Chairman, I think that this discussion warrants the utterance I made here on Friday last when I said the amendment was so important and far-reaching in its consequences that it should be read in print and carefully considered by every member before being voted upon.

The gentleman from Ohio [Mr. GARFIELD] has not enlarged upon the effect of this amendment if it should be adopted. It will work almost a revolution in the business of this House. I am perfectly content to agree that thirty days be struck out and that we insert "sixty days during a long session of Congress, and thirty days during a short session." But I do insist (and I appeal to the experience of every member on this floor to bear out the assertion) that in too many cases the sending of a bill to a committee of this House, which committee chances to be adverse to the purposes of the measure, is equivalent to consigning it to the "tomb of the Capulets." No matter what the majority of this House may want to do in such a case, it has no opportunity under the present rules to do anything. It seems to be the very essence of conservatism (if indeed this be a popular government under which the majority should have a chance to rule) to afford that majority the opportunity which this rule proposes. After a reasonable time has elapsed, (whether thirty or sixty days,) and a committee of this House has refused to report back for determination a measure sent to it for examination, it seems to me to be but fair and right to give, not to any one member of the House but to a majority of the House, the right to call up the bill and send it to the Calendar, or, if that majority please, to pass upon it at the instant. I do not think any danger should be apprehended from the amendment now pending.

Mr. WEAVER. The gentleman from Kentucky [Mr. BLACKBURN] has voiced almost verbatim what I desire to say. I will submit this, however. It occurs to my mind that the criticism of the gentleman from Ohio [Mr. GARFIELD] on the amendment is a criticism upon

the House itself. If this House, Mr. Chairman, can be trusted on the final passage of a bill where a majority vote will pass it, certainly the judgment of the House ought to be trusted upon a question of this character. This is a popular government, or it is nothing. I hope we have not reached that stage in our history where it can be called anything else. And why it is that a bill of great public necessity and importance which has been consigned to a committee cannot be brought by a vote of a majority of this House back to the House to be considered I cannot comprehend. A two-thirds vote rarely can be obtained, and yet it might be perfectly true that a majority of the members of the House might desire to pass the measure, might desire it should become a law, but they are powerless under the two-thirds rule to pass it. It is a species of legislative legerdemain that ought to be discountenanced in this House, and I hope on the final vote on the amendment of the gentleman from Kentucky it will prevail. It would be a great stride in the direction of reform, in the direction of true and genuine popular government.

Mr. GARFIELD. Will the gentleman from Iowa tell me whether he thinks a two-thirds rule is ever wise? Should we have everything by a majority?

Mr. WEAVER. Hardly ever. [Laughter.]

Mr. GARFIELD. Then you do not believe in having anything but by a majority all the time?

Mr. WEAVER. I will answer, in my judgment—though it may be very crude, for I certainly claim no legislative experience, certainly none as compared with that of the gentleman from Ohio—but in my judgment a majority vote ought to determine everything in this House except the expulsion of a member.

Mr. TOWNSHEND, of Illinois, rose.

The CHAIRMAN. No further debate is in order on this amendment.

Mr. OSCAR TURNER. I rise to a parliamentary inquiry.

The CHAIRMAN. The gentleman will state it.

Mr. OSCAR TURNER. Have I the right to accept the suggestion of the gentleman from Kentucky?

The CHAIRMAN. The gentleman who offered the amendment, at any time before it is voted on by the committee, may modify it to any extent he pleases.

Mr. OSCAR TURNER. Then I accept the modification of the gentleman having charge of the report, of sixty days during the long and thirty days during the short session.

Mr. TOWNSHEND, of Illinois. Does the Chair decide that debate is not in order?

The CHAIRMAN. It is not until after this amendment has been disposed of.

Mr. TOWNSHEND, of Illinois. There is but one amendment pending, and I move to strike out the last word.

The CHAIRMAN. That amendment is now pending, made by the gentleman from Ohio.

Mr. GARFIELD. I withdraw it.

Mr. PAGE. I object to its being withdrawn.

The amendment to the amendment was not concurred in.

Mr. TOWNSHEND, of Illinois. I move to strike out the last two words for the purpose of correcting an impression which may follow from the remarks of the gentleman from Ohio.

This amendment is simply for the purpose of enabling the House by a majority vote to determine whether a bill shall be placed on the public Calendar or not. If the bill is not of that nature which would strike the majority of the House favorably, it would not be placed upon the public Calendar. Every bill introduced of a public nature and sent to a committee and retained there for thirty days does not necessarily go on the Calendar, but only those bills which, after lying for thirty days in committee, shall receive the approval of a majority of the House.

A word or two more and I am done. I am in favor of this amendment partly for the reason it gives opportunity here to those who by their industry and by their energy have framed bills of great benefit to the public to obtain some action by the House upon them. There are industrious men here who unfortunately are placed upon committees which really have no jurisdiction, and yet who have prepared carefully drawn bills which they desire the House to pass upon, but which are sent to one of the three or four of the important committees of the House which do monopolize the entire legislation, and there they are buried and never heard of again. My purpose is to give a fair hearing not to frivolous, not to unimportant bills but to important measures which shall receive the approval of a majority of this House. It is for that reason I advocated the amendment when it was last under consideration.

The House will remember that the only effect of the amendment is that public bills and public resolutions, not pension bills or private bills of any character, shall have an opportunity of coming before this House and the question being determined as to whether they shall go upon the Calendar or not. That is all there is in this amendment.

[Here the hammer fell.]

Mr. WRIGHT. I rise to oppose the amendment. I object to it, Mr. Chairman, and I will repeat again for the benefit of the House what I have had occasion to say before, but may not have been distinctly heard, that I begin to suspect in this amendment there is "a cat in the meal-tub," and that a concealed effort is made on the question of a protective tariff. I do not want to put myself in the posi-

tion of attacking protective measures in detail, as has been the custom of this House to do of late. In the last Congress there was a bill passed taking the duty off of quinine, and the duty was taken off on the ground that it would benefit the poor. I am told that the price of quinine is much larger now than when we removed that duty, and an inferior article thrown upon the market. Now, in the present session a very plausible measure was brought forward by my friend from Missouri, [Mr. HATCH,] making salt free—good enough if it did not interfere with other matters of greater moment.

There is another attack in detail upon the great protective principle in several matters, which are not now developed. It is also suggested that the tariff on steel rails will be removed as the next objective point; and now, if we adopt the amendment as proposed by my friend from Kentucky, we put it in the power of the House to bring out of the committee any bill in detail that may be desired. And yet I think the protective principle is in better keeping now, in the hands of the proper committee, than it would be if the plan suggested here were adopted. Heaven knows where we might land if the plan suggested by my friend were adopted.

There are certain features of his amendment that are worthy of our sanction, that are all-proper and commendable. Reform is demanded. In the last Congress I was some ten months watching an opportunity to get before the House a supplement to the land bill I proposed. I reported that bill to the House at the commencement of this session of Congress. Three months have already expired and there is no way that I can pursue, no device that I can adopt, no strategy I can resort to, to get it before the House. I defy any member to obtain a hearing on any bill he may offer, public or private. Under this system of rules there is a worse tyranny than our people protested against in the days before the American Revolution. They fought for liberty then, and there are some of us here who might fight for liberty under these rules until we die, while the whole power of the House is locked up in the hands of the committee, or of two or three committees. They hold us in dead-lock. We are powerless in their hands. And should this be the rule of American legislation? Such it is.

While it is not my desire to force measures placed in the hands of committees out of them, and thus endanger great and important questions which affect our revenue laws, still it may be possible that we may, by permitting other great measures to be pigeon-holed, do a greater injury. In my judgment, a protective tariff is of vast moment to the prosperity of our whole country. I would rather see the tariff go to the bottom of the sea than adopt such measures as would destroy and kill other great measures which affect the entire body-politic. While I am an open and avowed protective-tariff man, I will not permit the pursuit of this idol to absorb other matters of secondary importance. It is the bane of our legislation that important measures which demand the attention of Congress should be placed in the hands of a committee every man of which might be its bitter and unrelenting enemy.

I believe that two hundred and ninety-three men are quite as capable of judging of a measure of public policy as thirteen or fifteen men. I believe further that any Representative on this floor who proposes a measure of legislation has a right to demand a test vote upon it. Let him answer to his constituents for the responsibility of the measure. The gag-law rule should have no existence in the American Congress. The amendment perplexes me. I am half inclined to support it, and yet there are reasons why I should not—a fair idea, however, as to the double text of the warp and woof of your legislation. Have we reached that time in our legislative history, Mr. Chairman, when a great measure of public policy may be locked up in committee, and when we dare not call the matter back to the House for the fear some other measure of equal interest to the country may be the subject of attack in detail and thus destroyed? A strange state of affairs, truly!

Mr. TOWNSHEND, of Illinois. I withdraw the amendment.

Mr. COX. I renew the amendment. I renew it for the purpose of saying this, that if no other man in this House interposes a protest to the speech just made by the gentlemen from Pennsylvania, I should feel under obligation myself to make it.

Mr. WRIGHT. What is that? Say that again. [Laughter.]

Mr. COX. The gentleman from Pennsylvania talks to us about liberty, and yet he would break down the liberty of buying and selling all around our star wherever we please. He would crush out the liberty of trade and would have our farmers, who are the potential elements of the prosperity of this country, taxed to death by these infamous tariffs which put hundreds of millions into the pockets of Pennsylvania and a few men at the expense of the whole country. Ay, he would put not twenty-five millions into the Treasury, but a thousand millions into the pockets of a few favored classes. The gentleman thinks the farmer people do not study this. I know this goes beyond mere party. I remember in a contest on the tariff in 1872, when General Schenck led that side of the House, we did make an advance and reform to the amount of \$40,000,000 with the aid of Senators LOGAN and ALLISON, republicans, who had the grace and pluck to fight for their western constituency.

I believe, sir, in making any modification of this rule which will take from the Committee of Ways and Means their control over tariffs.

I want tariffs sent to that committee sent back to this House for

the action of a majority. When the gentleman from Ohio [Mr. GARFIELD] sat down I was near him and I heard him say this rule was intended for reform of the tariff. I did not know that was the object of my friend from Kentucky, but the moment I found that was the object I said I would vote for it because I am in favor of free land and free trade.

For what avail
The plow or sail,
Or land or life,
If freedom fail?

Freedom to go around the world as we please with our magnificent surplus productions; freedom to buy where we please in the cheapest market, and to barter and exchange as we please. And I hail with satisfaction this effort on the part of Kentucky, which has only a little tariff on hemp, I believe, of 12 per cent.; and I hope there will be at least hemp enough to hang protection when that question is brought into this House.

What I desire now by amendment of the rules is that you may bring in your salt, that you may bring in your quinine, if you please, that you may bring in your steel rails for the safety of human life, for the transportation of your produce cheaply to the seaboard, and for the extension of your agricultural productions; so that we may indeed have that privilege and freedom of trade which have belonged to the American people ever since they put forth their declaration of independence from the protection of Great Britain.

Mr. WRIGHT. I desire to make an inquiry of the gentleman from New York.

The CHAIRMAN. The time of the gentleman from New York has expired.

Mr. HAWLEY. I rise to oppose the amendment offered by the gentleman from New York [Mr. COX] and to oppose the proposed addition to the rule.

Mr. Chairman, as I listen to the gentleman from New York I am almost persuaded that it would be well to abolish the tariff entirely. As I listen to others I am satisfied that the tax on whisky ought to be taken off. As I listen to others I am satisfied that the tax on tobacco might well be removed. And I come, then, in general, to the conclusion that the most economical and just way to administer this Government is to abolish the tariff and taxes and to pay the expenses from the Treasury.

But I did not rise to discuss the tariff question. I am opposed to the pending amendment. It gives the majority of the House a right after thirty days to call back from a committee any bill whatever and place it on the Calendar.

A MEMBER. Sixty days.

Mr. HAWLEY. Some one says sixty days. I do not care which it is. It is obvious under that rule, if it should be adopted, it would be entirely in order after thirty days or after sixty days to bring back every single bill which had been referred, at least every public bill, and there cannot be less than two thousand public bills now pending. And these motions are to be privileged motions. There would then be on the first Monday occurring after the expiration of thirty days two thousand privileged motions to discharge committees, each of which motions would be debatable under the rule. It would take us some time, doubtless, to call the roll two thousand times, and we should have a respectable Calendar with two thousand public bills upon it. And then with the other rule, which requires that every bill appropriating any money whatever should have the yeas and nays called upon it, I believe we should rather divide ourselves into three hundred Congresses and endeavor thereby to get through the business.

I regard the rule as mischievous and utterly impracticable. But if it is to pass I desire an opportunity to move a slight amendment. It is not in order now I believe because there is an amendment to an amendment pending, but I will seek an opportunity to offer it.

The CHAIRMAN. The amendment to the amendment is a merely formal one. Does the gentleman from New York [Mr. COX] withdraw the formal amendment?

Mr. HAWLEY. I ask the attention of the gentleman from New York. Will he permit me to offer a substantial amendment by withdrawing the formal amendment which is now pending?

Mr. COX. I withdraw the formal amendment.

Mr. HAWLEY. I offer the following amendment to the amendment:

Insert after the word "shall" and before the words "be discharged" the word "within ten days."

So that after a majority of the House shall have ordered the measure to be returned in order to place it on the Calendar the committee having it in charge may have time to perfect it. I would have the committee not return it in an entirely crude state but would give it some days to put it in shape. If the amendment is to pass, I think what I now offer will be an improvement.

Mr. BLACKBURN. That is right.

Mr. TOWNSHEND, of Illinois. Let the amendment be now reported as it will read if amended.

The Clerk read as follows:

Add to Rule XXIV the following:

When a public bill, resolution, or proposition shall have been referred to a standing or select committee of the House and no report has been made thereon for sixty days during a long session and for thirty days during a short session of Congress, it shall be in order for the member who introduced said bill, resolution, or

proposition, on any Monday immediately after the expiration of the morning hour to offer a resolution or move to discharge the committee from the further consideration of the same, which resolution or motion shall then be considered, and if decided in the affirmative, the committee shall within ten days be discharged and the bill, resolution, or proposition shall be placed on a proper calendar, unless a majority of the House shall determine then to consider the same.

Mr. HARRIS, of Virginia. I desire to suggest that the amendment of the gentleman from Kentucky [Mr. OSCAR TURNER] contemplates that the identical bill should come back before the House as it went to the committee. Now the amendment of my friend from Connecticut [Mr. HAWLEY] anticipates that when it gets before the standing committee that committee may amend the measure or make a substitute for it.

That would not reach what is contemplated by the amendment of the gentleman from Kentucky. His proposition is to bring back the identical bill which was referred to the committee. The object of the ten days' time is to allow the committee an opportunity to amend the bill before reporting it, which would be inconsistent with the object of the amendment proposed by the gentleman from Kentucky.

Mr. FINLEY. I would like to ask the gentleman from Connecticut [Mr. HAWLEY] whether his amendment enlarges the power now given under the proposed Rule XXVIII; whether what is claimed for his amendment cannot be obtained under Rule XXVIII, providing for suspensions of the rules on Monday?

Mr. HAWLEY. I do not see anything about this matter in Rule XXVIII. I will correct what I think is a misapprehension of my friend from Virginia, [Mr. HARRIS.] I think the object of those who favor this proposed new rule is not so much to get back the original bill literally as to get a report upon it, for whatever the committee may report the introducer of the bill will have a right to move as a substitute for the bill reported that which he originally introduced. If the object is to get back a bill as originally introduced, then why refer it at all?

Mr. FRYE. As the gentleman from Connecticut [Mr. HAWLEY] seems to be the one perfecting this absurd proposition, I want to suggest one other point that needs perfecting. There is no provision here for an extra session. In these modern days extra sessions are quite frequent; and will not the gentleman from Connecticut provide for the extra sessions?

Mr. HAWLEY. "The gentleman from Connecticut" has already suggested a remedy; that is, that we divide ourselves into three hundred different Congresses and sit perpetually.

The question was taken upon the amendment of Mr. HAWLEY to the amendment, and it was not agreed to.

The question was then taken upon the amendment moved by Mr. OSCAR TURNER; and upon a division there were—ayes 78, noes 92.

Before the result of the vote was announced,

Mr. TOWNSHEND, of Illinois, called for tellers.

Tellers were ordered; there being 42 in the affirmative, (more than one-fifth of a quorum;) and Mr. OSCAR TURNER and Mr. FRYE were appointed.

The committee again divided; and the tellers reported that there were—ayes 80, noes 108.

So the amendment was not agreed to.

Mr. WHITE. I move to amend Rule XXIV by adding as a new clause what I send to the Clerk's desk.

The Clerk read as follows:

On the first and fourth Fridays of each month, the Calendar of private bills shall be called over, (the chairman of the Committee of the Whole House commencing the call where he left off the previous Friday,) and the bills to the passage of which no objection shall then be made shall be first considered and disposed of. When a bill is again reached, after having been once objected to, the committee shall consider and dispose of the same, unless it shall again be objected to by at least five members.

Mr. WHITE. Members of the Committee of the Whole, who have listened to the reading of this proposed amendment, have discovered that it is the present existing rule of the House, known as Rule 129. By this amendment I propose to renew what we know as "objection day" upon the Fridays indicated therein. I think it is quite proper that the sense of the House shall be tested upon the propriety of retaining the original rule for the consideration of bills upon the Private Calendar.

If the proposed rules now under consideration shall be adopted by the House, all the old rules will be abrogated; and then on every recurring Friday the House will be rushed into the immediate consideration of bills on the Private Calendar, about which members may never have previously heard.

When the existing rule upon that subject was adopted, as far back as 1839, if I recall rightly the history of legislation, the aggregate number of bills introduced during a Congress was not over two hundred, and they were generally of a public character, or relating to something of general interest. We know now that our files are swollen from two hundred bills in 1839 to some six thousand or seven thousand for a term of Congress in each House. Now, if I have read rightly the record, the number of bills already pending in this House, having been introduced by its several members, is about five thousand, three-fourths of which relate entirely to private matters.

The criticism that is made against the existing rule for objection day is that it puts it in the power of one member to exercise his whim and his caprice against any particular bill by objecting to its consideration. Now, I have too high a regard for the discretion and for

the fairness of individual members of this House to charge any one with being influenced by a purpose of that kind. On the contrary, an objection properly made to the immediate consideration of a private bill which proposes to appropriate a large amount of money from the Treasury gives the member and the committee and the country an opportunity to ascertain its actual merits; and if it has merits it will pass, and if it has not it will fail as it should fail.

In answer to this it is said that each of these bills before it gets on the Calendar has received the consideration of a committee of this House. Yet we very often see bills which have received the consideration of committees, and have been placed upon the Calendar upon insufficient evidence, and a judicious objection made to their consideration on objection day has enabled members to discover subsequently that a bill of entirely fraudulent character has been imposed upon the House. I favor the old rule.

[Here the hammer fell.]

Mr. BLACKBURN. I sincerely trust that the amendment of the gentleman from Pennsylvania [Mr. WHITE] will not be adopted. It simply means to re-establish the present rule as it now exists, providing for what is known as "objection day." The Committee on Rules intended, and so stated in their report, to do away with objection day. I defy the gentleman from Pennsylvania [Mr. WHITE] or anybody else to assign one single reason in support of its continuance or maintenance.

What reason is there for continuing a practice which allows any bill on the Private Calendar to be passed over because of a single objection, when if by chance or luck it comes up on the next Friday it is not amenable to that objection at all? Under the proposed amendment one Friday is objection day and the next Friday is consideration day; and just by mere chance, as a bill happens to be reached on that Calendar on objection day, the interposition of a single arbitrary objection suffices to prevent its passage for the time.

Mr. WHITE. Will the gentleman allow me?

Mr. BLACKBURN. I hope the gentleman will not make another speech.

Mr. WHITE. Not at all. Has not the gentleman known bad bills killed by objections?

Mr. BLACKBURN. No, sir.

Mr. WHITE. Well, I have.

Mr. BLACKBURN. I know that these bills never go to the Private Calendar unless they have been reported favorably by standing committees of the House. I take it for granted that until one of the standing committees of the House has carefully considered a bill and recommended its passage it cannot get to the Calendar. When it goes there, a *prima facie* case at least is made out that the bill is entitled to consideration, if not to passage. I would rather have the judgment of one of the standing committees of this House as to the merit or equity of a matter specially committed to it than to have the single unsupported opinion of any member on this floor. Besides, sir, two-thirds of the standing committees of this House report these bills which go to the Private Calendar. I say that if you intend to reinstate "objection day" you should make it apply to every Friday, and not leave it to chance or fortune whether a bill shall be reached upon an objection Friday when the objection of a single member will prevent its consideration, though if the bill had been fortunate enough to have been reached on the Friday before or the Friday after, that objection would have been powerless. The rule as it stands to-day stands without a reason to support it. There is nothing to be urged in its behalf. The Committee on Rules have proposed to strike it down, and to put every bill on the Private Calendar upon an equal footing with every other bill. That is the whole object of the amended rule as embraced in this revision.

The question being taken on the amendment of Mr. WHITE, it was not agreed to, there being—ayes 8, noes not counted.

Mr. STEVENSON. As an amendment to Rule XXIV I submit the following, which I will state is the same proposition as that offered by the gentleman from Kentucky, [Mr. OSCAR TURNER,] except that I have inserted the words "pertaining to revenue."

The Clerk read as follows:

Add to Rule XXIV the following:

When a public bill, resolution, or proposition pertaining to revenue shall have been referred to a standing or select committee of the House and no report has been made thereon for thirty days, it shall be in order for the member who introduced said bill, resolution, or proposition, on any Monday, after the call of the States and Territories for bills and joint resolutions, to offer a resolution or move to place said bill, resolution, or proposition on the proper calendar, which resolution shall then be considered; and, if decided in the affirmative, the bill, resolution, or proposition shall be placed on the Calendar, and the committee discharged from further consideration of the same.

Mr. HAYES. Is not this the same as the proposition of the gentleman from Kentucky which the Committee of the Whole has already voted down?

The CHAIRMAN. The proposition of the gentleman from Kentucky related to all bills of a public nature. This amendment, as the Chair understands, is confined to bills pertaining to revenue.

Mr. STEVENSON. I have no concealments, Mr. Chairman, as to my motive in offering this amendment. I desire that this House, when a majority of its members so desire, may at any time be brought to a vote upon the tariff. Many bills have been introduced and are now pending before the Committee of Ways and Means, looking to radical reforms in the present tariff. But, sir, as we know by sad experi-

ence, these bills are doomed to "that sleep that knows no waking." Notwithstanding the burdens imposed upon the people by the iniquitous and unjust tariff legislation upon our statute-books, we find our hands tied by the rules of this House when we attempt reformation. Bills looking to a removal of these restrictions upon trade, looking to a removal of some of the burdens imposed upon the producing classes by unwise legislation, are doomed to the oblivion of the committee room.

True, sir, a majority of this House may desire to remove the tariff from salt; may desire to place on the free list printing-paper and the chemicals used in its manufacture; may desire, as I do, that all laws of a purely protective character, laws which protect eastern manufacturers at the expense of western producers, shall be repealed. But, sir, what are the facts? As every gentleman knows, these bills are not reported. Day after day, year after year passes, and the people are still doomed to bear the burdens imposed upon them, not in the interest of the Government, but for the benefit solely of a few manufacturers. I repeat, sir, I have no desire to deprive the Government of all necessary revenue. But "where protection begins revenue ceases." Every line upon our statute-book placed there in the interest of protection is at the expense of the producing and other great industries of this country.

Mr. Chairman, at the last session of Congress, by suspension of the rules, we were enabled to pass the bill of the gentleman from Kentucky [Mr. MCKENZIE] placing quinine upon the free list. The country has realized already some of the benefits resulting from that legislation. To accomplish that reform it was necessary to suspend the rules of which we so justly complain. At the present session the gentleman from Missouri [Mr. HATCH] moved the suspension of the rules and the passage of a bill removing the duty upon salt. That bill failed to pass, two-thirds failing to vote for it, notwithstanding its passage was favored by a majority of this House.

Mr. Chairman, under the present rules, if the Committee of Ways and Means are hostile to tariff reform, the majority finds itself powerless. The amendment I have proposed places it within the power of the majority of the House, under wise restrictions, to inaugurate legislation without awaiting the slow or hostile action of a committee. To this end I have offered the pending amendment. As I have said, I have no desire to conceal my purpose. Let this amendment be adopted, and there is hope for those who desire reform in our tariff legislation. I appeal, then, to every gentleman upon this floor who opposes legislation designed to benefit the few at the expense of the many, to stand by the pending amendment.

I have no hesitation, Mr. Chairman, in saying that I greatly prefer the amendment proposed by the gentleman from Kentucky [Mr. OSCAR TURNER] to the one now pending. His amendment was of broader scope. I regret, and I think the majority of this House will hereafter regret, having rejected it. Under that amendment to our rules it would have been within the power of the majority, without reference to the action of committees, to inaugurate wise and salutary legislation. Under that, measures pertaining to reform in tariff and finance could be brought before this House for action. A vote could be secured in this House upon bills looking to financial reform, bills which some of us deem of importance, but which, because of the non-action of the Committee on Banking and Currency, have not been, possibly never may be, reported. There is no way to bring them before the House for action except in the manner suggested in the amendment. If a majority of the members of this House are hostile to them, well and good; but at least, sir, let us have a vote upon them.

One word more, Mr. Chairman. Under the rule proposed, it would have been possible for the majority of this House to have passed the bill equalizing the bounties of soldiers, without reference to the action which may be taken by the committee before whom that bill is now pending. In short, Mr. Chairman, that rule would have given this House at all times the control of its legislation. I trust, sir, that the amendment I have proposed, looking as it does to reform in some of the departments of legislation, may receive the sanction of this House.

[Here the hammer fell.]

Mr. DUNNELL. Mr. Chairman, it seems to me the adoption of the amendment proposed by the gentleman from Illinois [Mr. STEVENSON] would work, as has been already suggested, a very great revolution in our methods of doing business. We have committees appointed for a very worthy purpose—for the careful investigation of questions of legislation. A given question may grow out of thirty or forty bills which have been introduced and referred to a committee. Take this very question of a tariff. Forty, fifty, or sixty bills may have been referred to the committee. With those bills as a basis the committee propose a harmonious and systematic revision of the tariff; with those bills the committee can make such a revision. But if this rule be adopted, then right in the midst of the investigation, when, perhaps, the committee have only half completed the work of revision, any one of these bills may be taken out of the hands of the committee, brought into the House, and put upon its passage. It seems to me that the adoption of a rule of this kind would cripple very many of the committees of the House. They would be uncertain how long a bill was to remain in their hands.

It is said here that this is a democratic government, and it is true.

Mr. LOWE. No; this is an oligarchy of committees.

Mr. DUNNELL. But here in the House of Representatives we are

called upon to legislate under some rules. If a majority may at any time step in and cut short in this way the deliberations of a committee we shall have wrought a great revolution.

Mr. STEVENSON. The amendment proposes to allow a committee ten days in which to perfect a bill after the resolution directing it to be reported has been adopted.

Mr. DUNNELL. Mr. Chairman, that very concession on the part of the gentlemen is an argument against the adoption of the amendment. Take, for instance, some questions which have been before the Committee of Ways and Means. Take the reduction of the tariff on steel rails. That question came before us while we were investigating the tariff upon sugar. We were unable to complete the investigation in ten days whether there should be a reduction of tariff on steel rails. One question follows another; one is linked with another; and it is impossible to get through every question in the short space of ten days.

[Here the hammer fell.]

Mr. BAYNE. I move to strike out the last word.

Mr. Chairman, the effort of the amendment of the gentleman from Illinois is perfectly apparent. It is to take up our present tariff system, item by item, and to strike that system down. That is the purpose of it. The amendment proposed by the gentleman from Kentucky [Mr. OSCAR TURNER] had merit in it, because there doubtless are bills presented in this House entitled to consideration. There are bills withheld by committees which should come before the House for consideration, and were it not for the fact that the tariff system of the country is confronted by a party which largely favors its reduction or perhaps its extinction, I would have voted for the gentleman's amendment, because I am in favor of the freest and fairest consideration of all measures which may be proposed in this body.

But while I favor that, it must be borne in mind there exist in this country two parties. One party has constantly gone forward in the work of building up and the other of them is distinguished but for one great characteristic, and that is for tearing down. The republican party has built up the institutions of this country. The democratic party is making efforts in every direction to tear those institutions down. It wants to restrict the authority of the United States in every direction. It is desirous of doing it in the tariff system. It is desirous of doing it in reference to courts, and every effort is directed toward the grand achievement of taking away power from the Federal Government and vesting it in the States. This is one of the measures to facilitate and promote that scheme.

It is particularly pernicious when applied to the system to which the gentleman from Illinois particularly applies it, for if there be one thing which should be considered deliberately and fully by the Committee of Ways and Means it is the tariff system.

Look what we did by passing under a suspension of the rules what is called the quinine bill. We permitted quinine in its manufactured state to come in free, and yet we imposed upon many of the articles entering into the composition of quinine a duty, thus discriminating in a double sense against the people of this country and the men engaged in the production of that article. I say, sir, that any rule which will permit the party whose object is not to build up facilities for promoting such legislation on this floor is dangerous, and should not receive the support of this House.

[Here the hammer fell.]

Mr. SIMONTON. I desire to say only a word, Mr. Chairman, and will detain the committee but a moment. It appears to me the gentlemen by raising the cry that this amendment is intended to attack the tariff are about to prevent that modification of our rules which it seems to me just and fair legislation demands. When committees are formed they are the servants of the House by which it accomplishes legislation. That is their legitimate purpose; that is what they are for; and it never was intended they should turn around and be the masters of the House. They are the arms by which it works, by which it effects its purposes, and this is intended only to so curtail the power of committees, so that when they act in direct violation of the will and the wish of the majority of the House they shall be compelled to attend to that legislation which the House wants to effect. It is only under such circumstances this legislation should apply. It never was intended to grant power to obstruct the legislative will of the House.

[Here the hammer fell.]

Mr. BAYNE, by unanimous consent, withdrew the *pro forma* amendment.

Mr. WEAVER. I offer the following amendment:

After the word revenue insert "or finance," so it will read:
"When a public bill, resolution, or proposition appertaining to revenue or finance shall be referred to a standing or select committee," &c.

Mr. Chairman, it is a well-known fact that a majority of the members of this House were elected upon their professed devotion to the doctrine that the Government should issue the currency, and that it should not be issued by or through the banking corporations of the country. And yet it is also true that as the committees of this House are at present constituted it is absolutely impracticable, ay, it is impossible, to get a bill before this House substituting Treasury notes for national-bank currency.

I desire, sir, to offer this amendment in the spirit of fairness, and to test the sincerity of the professed soft-money men of this House. I offer it with all sincerity, and I wish to put gentlemen if not upon

the record at least upon their vote on this proposition, to see if there is any substance in their profession of devotion to this doctrine, or whether it be for the mere purpose of hoodwinking the people at home that they may betray them in this House. I ask my democratic friends on my left and I ask my republican soft-money friends on my right to unite with the party of the center in this amendment now pending.

Mr. STEVENSON. I am in favor of the proposition of the gentleman from Iowa; but I think it better to have a vote on his amendment and a separate vote on the amendment I have offered.

The CHAIRMAN. The first question is on the amendment of the gentleman from Iowa to the amendment of the gentleman from Illinois.

The House divided; and there were—ayes 42, noes 55.

Mr. KENNA demanded tellers.

Tellers were ordered; and Mr. WEAVER and Mr. HUMPHREY were appointed.

The House again divided; and the tellers reported—ayes 77, noes 71. So the amendment to the amendment was agreed to.

The question next recurred on the amendment of Mr. STEVENSON as amended.

Mr. STEVENSON. I call for tellers.

Tellers were ordered; and Mr. STEVENSON and Mr. FRY were appointed.

The House divided; and the tellers reported—ayes 75, noes 101.

So the amendment was rejected.

The Clerk read as follows:

MISCELLANEOUS RULES.

RULE XXV.

PRIORITY OF BUSINESS.

All questions relating to the priority of business shall be decided by a majority without debate.

RULE XXVI.

PRIVATE BUSINESS.

Friday in every week shall be set apart for the consideration of private business, unless otherwise determined by a majority of the House.

Mr. BAYNE. I offer the following amendment:

The Clerk read as follows:

Insert after the word "business," in the second line of Rule XXVI, the following:

And pension bills and bills for the relief of soldiers and sailors shall have precedence until the Private Calendar shall have been cleared of them.

So that if adopted the rule will read:

"Friday in every week shall be set apart for the consideration of private business, and pension bills and bills for the relief of soldiers and sailors shall have precedence until the Private Calendar shall have been cleared of them, unless otherwise determined by a majority of the House."

Mr. BAYNE. I shall not detain the committee but a moment, as I have but a word to say in reference to this amendment. It will enable the House to take up and to dispose of pension bills and bills for the relief of soldiers without unnecessary delay. It is well known to every member of this House that it often occurs that private bills have to yield precedence to some political questions which take up the whole of the day's session, and as a necessary consequence no action can be had upon the private bills, while at the same time it is due to the members on this side of the House as well as to gentlemen upon the other side to say that there is no hesitancy whatever in acting with all reasonable dispatch upon cases where the rights of the soldiers are involved. All parties agree in their efforts for the passage of bills relating to the pensions of soldiers or for their relief, but other matters get into the House and prevent the consideration of pension bills for days and days at a time—bills which ought to be allowed to go forward to the Calendar for prompt consideration.

It will not prevent the suggestion of my colleague, the Speaker of the House, that a particular night might be set apart for the consideration of these pension bills, but this amendment, if adopted, will simply facilitate the consideration of these bills, and give the House an opportunity to get rid of them and then pass to the consideration of other matters. Without taking up any more time, I will simply say I hope the amendment will be approved by the House.

Mr. RANDALL, (the Speaker.) I rise to a question of order.

The CHAIRMAN. The gentleman will state it.

Mr. RANDALL, (the Speaker.) Is not this substantially the amendment which was voted down before?

The CHAIRMAN. This includes sailors as well as soldiers, which is the only difference the Chair perceives.

Mr. RANDALL, (the Speaker.) I will only say in this connection that I think claimants for pensions are better off now in the House than if this amendment was adopted, because on Fridays the motion to adjourn is constantly made, preventing the transaction of any business, and often, in many cases, it might be difficult to secure a quorum. I believe that pension bills can be passed through this House at any time, and that it is better for the pensioners to leave the rule as it is now.

Mr. BLACKBURN. I wish to ask the gentleman from Pennsylvania a question before he takes his seat.

Mr. RANDALL, (the Speaker.) Certainly.

Mr. BLACKBURN. I want to ask the gentleman whether a prop-

osition is not now pending, which comes up on next Monday first on the list for recognition to suspend the rules, to set apart two evenings for the consideration of pension bills?

Mr. RANDALL, (the Speaker.) It is not on any list, but it is pending.

Mr. BAYNE. I would like to ask my colleague from Pennsylvania a question. Will the adoption of this amendment preclude such action as is proposed to be taken here—that is, to set apart certain evenings for the consideration of pension bills?

Mr. RANDALL, (the Speaker.) If you take all the pension bills from the Private Calendar and give them two or three or four nights, if necessary, there is no occasion for this rule at all. And if I know the temper of this House we will give every night that is necessary in every session to dispose of all the pension bills before the House.

Mr. WARNER. I oppose this amendment for the reason that I think all this pension business should be taken out of the House and referred to a commission; and the chairman of the Pension Committee, as I understand, introduced a bill yesterday looking to this end, which I think will have the early consideration of the House. This House is not the place to consider such bills.

The CHAIRMAN. The question is on the amendment of the gentleman from Pennsylvania, [Mr. BAYNE.]

Mr. WILSON. I ask that the amendment be again read. The amendment was again read.

Mr. BROWNE. I move to strike out the last line.

When this amendment was proposed by the gentleman from Pennsylvania [Mr. BAYNE] I intended to give it my support. But upon the assurance of gentlemen on both sides of the House that pending pension claims shall have at least a night or two during the session, I think perhaps the amendment should not be urged. I notice, however, that when the proposition was made the other day for an evening session to consider pension bills gentlemen objected, and by calling for the yeas and nays on a motion to adjourn prevented even a vote of the House on the question. If that policy is to be pursued, then, as one feeling some interest and some sympathy with the soldiers of this country, I am disposed to vote for any rule that will give them an opportunity of being heard.

I ought to say a word to my friend from Ohio, [Mr. WARNER.] It strikes me that it is too late in the day to raise the question of consideration of private pension bills in the Congress of the United States. This Congress has been acting upon those bills constantly for fifteen years. The question has never arisen as to the impropriety of such action until it has been raised during the present session of this Congress.

These are not properly appeals from the Commissioner of Pensions. There are many cases in which the Commissioner of Pensions could not allow the claims under existing law that so strongly address themselves to the sympathy of the representatives of the people that we are willing to pass them by means of private bills. Hundreds of such cases occur, and many of them are on the Calendar of this House to-day, cases in which the Commissioner of Pensions could not, under existing law, give a pension, and yet, by reason of the peculiar circumstances of the case, it is eminently proper that this House should act upon them.

Gentlemen say it is expensive. Why, we pass two or three hundred claims of this kind, perhaps, during a Congress, and the sum appropriated or taken from the Treasury by those bills is insignificant in comparison with the \$29,000,000 that are paid upon the general pension-roll in cases passed by the Department of the Interior.

More than that; the ordinary regular pension list is constantly being diminished by the death of the soldiers, and this diminution will increase from day to day and from month to month; and the cases that we substitute by the action of the Pension Committee and of this House will not increase the aggregate of the money we take out of the Treasury for the payment of these claims. But I am for giving to those who may be entitled to them the pittance they may receive under this action of the House even if it should increase the expenses of the Government.

[Here the hammer fell.]

Mr. WEAVER. Will the gentleman from Indiana allow me to ask him a question?

Mr. BROWNE. Certainly, if the Chair will indulge me so far.

Mr. WEAVER. Did the gentleman from Indiana not vote against the amendment of the gentleman from Kentucky, [Mr. OSCAR TURNER?]

Mr. BROWNE. I did.

Mr. WEAVER. Under that amendment would it not have been possible to have brought in after thirty days the bill offered by me for the relief of the soldiers, known as the soldier bill? The gentleman's professed devotion to the interests of the soldier seems to come in too late after his voting against that amendment.

Mr. BROWNE. Does the gentleman refer to the bill introduced by himself as the peculiar bill of the soldier?

Mr. WEAVER. I do.

Mr. BROWNE. Then I want to say to the gentleman, for I may not have the opportunity of putting myself on the record by my vote, that I should vote against that bill most cheerfully and I ask to be so recorded now.

Mr. WEAVER. I will ask the gentleman further, is his name not on a petition to this House wound around a corn-stalk, on which there

are 828 names—General BROWNE's being one of them—in favor of the passage of that bill?

Mr. BROWNE. It is quite likely, sir.

Mr. WEAVER. It is altogether true.

Mr. BROWNE. That only proves that which the gentleman may live long enough to learn, namely, that we have more sense now than we had yesterday.

Mr. WEAVER. It proves this, that the gentleman can profess one thing at home and be another thing here in Congress.

Mr. BROWNE. The gentleman is mistaken. I do not fear the record. The gentleman will find he is mistaken.

The question being taken on Mr. BAYNE's amendment, it was not agreed to.

Mr. DUNNELL. I offer the amendment which I send to the desk. The Clerk read as follows:

Strike out the words "majority of the House" and insert the words "two-thirds of the members present and voting," so that, if amended, the rule will read: "Friday in every week shall be set apart for the consideration, of private business, unless otherwise determined by a two-thirds vote of the members present and voting."

Mr. DUNNELL. Under these proposed rules the business of all the other days of the week but Friday cannot be dispensed with except by a two-thirds vote. I simply desire to put Friday, which we dedicate and set apart for private business, on the same footing and protected in the same way that the business of other days of the week is protected. I trust the Committee of the Whole will not object to this amendment. We devote but one day in the week to the consideration of private business, and it seems to me that that day should be protected by a two-thirds vote.

Mr. SPRINGER. If the gentleman will yield me the remainder of his time—

Mr. DUNNELL. I will do so.

Mr. SPRINGER. I hope this amendment will be adopted. The vast amount of private business now pending in the House is entitled to have one day in the week set apart for its consideration. At present the delay in the consideration and passage of private measures by this House is such that it amounts to an almost absolute denial of justice to all persons interested in such measures. It is well known to every member here that we have now on the Calendar of this House something like three thousand or four thousand bills of various kinds for relief to private parties.

Mr. TOWNSHEND, of Illinois. Not on the Calendar.

Mr. SPRINGER. I mean pending before committees of the House and on the Calendar. The parties interested in these bills have no place to go to but to this House for relief. I regret that. I have introduced, and there is now pending before the Committee on the Judiciary, a constitutional amendment prohibiting this House from passing any private bill on any subject, so that if that shall become the law of the land it will force us to provide by general law for the disposition of all such cases. In my judgment that is the proper course. But while there is no general law on the subject, parties cannot obtain redress except by coming to this House. In my judgment this House is the worst tribunal in the world for the settlement of private claims, and it is injustice to the claimants as well as to the Government to force these claims to be brought here. But under the embarrassing circumstances surrounding them I think private claimants should have one day in seven for the consideration of their business.

Mr. BLACKBURN. So do I, unless the majority of the House shall determine otherwise. I hope the amendment will not be adopted.

The question was taken upon the amendment of Mr. DUNNELL; and upon a division there were—ayes 68, noes 56.

Mr. BLACKBURN. I will not ask for tellers, but I give notice that I will in the House call for the yeas and nays on this amendment.

No further count being called for, the amendment of Mr. DUNNELL was agreed to.

Mr. WHITTHORNE. I desire to offer as an independent rule, to come in after Rule XXVI, that which I send to the Clerk's desk.

The Clerk read as follows:

Thursday in every week shall be set apart for the consideration of business on the House Calendar, unless otherwise determined by a majority of the House.

Mr. WHITTHORNE. I offer this as an independent rule, just now, as the Speaker of the House is present, more for the purpose of obtaining his construction of the rules as they are here reported.

For instance, what opportunity for the consideration of business on the House Calendar will there be under the operation of these proposed rules? In other words, if the House is from day to day to go into Committee of the Whole for the consideration of appropriation bills and revenue bills, what opportunity will there be given for the consideration of bills administrative or reformatory in their character on the House Calendar?

In my opinion it will be found that unless the opportunity is given as proposed by the independent rule which I have submitted, there never will be, under the administration of these rules, an opportunity of reaching business upon the House Calendar, so called. I propose by this independent rule simply to put the public business of the country on the same level with the private business under the rule which has just been passed.

Mr. RANDALL, (the Speaker.) I do not propose to give a construction to any rule until it is enacted into a rule. I suppose, how-

ever, that the manner of reaching business on the House Calendar will be within the power of the majority of the House.

Under these proposed rules, after the motion to proceed to business on the Speaker's table shall have been disposed of, the first motion in order will be a motion that the House resolve itself into Committee of the Whole House on the state of the Union to consider, first, bills raising revenue and general appropriation bills, and then other business on the Calendar; that is, other bills appropriating money. After that has been disposed of, or if a majority of the House shall vote down the motion to proceed to the consideration of that character of business, it will then be in order to proceed to the consideration of business on the House Calendar. It will be noticed that under the proposed rules the power of the majority of the House is always paramount as to what business shall be considered, except in a few cases where a two-thirds vote is required.

Mr. WHITTHORNE. Begging pardon of the committee, it is just to that point that I wish to call attention. Under these proposed rules measures which take money from the Treasury are to be first in order and to have precedence in consideration. Private bills appropriating money are to have a special day, Friday, set apart for their consideration.

Now, I desire that one day shall be set apart for the consideration of business on the House Calendar, and that that business shall be placed in such a position that if, for instance, it is desired to reform the bank laws of the country, or the judiciary laws of the country, or if we want to enter upon any reformatory or amendatory legislation whatever, we shall not be confronted with the ruling of the Speaker, properly made under these rules, that the consideration of bills appropriating money is first in order. Upon one day at least out of the legislative days of the week let those of us who are interested in the consideration of public administrative questions have the right to move to proceed to the consideration of the Calendar on which they are placed rather than to proceed to the consideration of other business. In other words, my object is to put the public business of the country on precisely the same footing as you have put private business.

Mr. BLACKBURN. Is that what the gentleman proposes by this amendment, when Rule XXIV already provides the order of business, and puts it within the power of a majority of the House at any time to go to the House Calendar, but, anterior to that, if a majority shall so determine, to go into Committee of the Whole House on the state of the Union to consider, first, bills raising revenue, then bills appropriating money? Having gotten through with these, a majority of the House goes to the House Calendar. Now, if the amendment of the gentleman from Tennessee be adopted, it will give to the House Calendar equal rights with bills raising revenue and general appropriation bills on every day of the week, besides an exclusive privilege on Thursdays. One class of public business, the most important of all public business—bills for the raising of revenue and the disbursement of public money—will be refused equal rights, or any rights at all, on Thursdays.

The CHAIRMAN. The Chair will remind gentlemen that debate is exhausted.

Mr. RANDALL, (the Speaker.) It is best that we should understand this matter.

The CHAIRMAN. If the point is not made the Chair will indulge gentlemen.

Mr. RANDALL, (the Speaker.) I would like to refer the gentleman from Tennessee to Rule XIII, which creates the calendars. The first clause specifies exactly what shall go to the Committee of the Whole House on the state of the Union: First, bills raising revenues; second, general appropriation bills; third, bills of a public character directly or indirectly appropriating money or property. Now, the reason these bills are included in this clause is because under another rule bills raising revenue or appropriating money must receive their first consideration in Committee of the Whole on the state of the Union.

The second clause of Rule XIII provides a "House Calendar." What bills go to that? "All bills of a public character not raising revenue nor directly or indirectly appropriating money or property." These bills need not go to the Committee of the Whole at all for consideration; they are not subject to a point of order and can be considered in the House.

These rules are not subject to the criticism made by the gentleman from Tennessee, that we have given undue advantage to private bills over public. Whenever the motion to go into the Committee of the Whole on the state of the Union is made a majority of the House, if they wish to reach the House Calendar, have only to say, "No, we will not go into Committee of the Whole on the state of the Union to consider bills raising revenue or appropriating money; we want to get to the House Calendar to consider general public business." The motion to go into Committee of the Whole on the state of the Union being negatived, the next motion is to consider the House Calendar, which is thus readily reached. It will be seen, therefore, that the thirteenth rule and the twenty-fourth rule are in exact harmony, one creating the Calendars, the other specifying the order of motions with reference to business on the Calendars.

Mr. WHITTHORNE. If I can have the attention of the House for a moment I propose to follow the order of proceeding under these rules. Upon Tuesday, Wednesday, Thursday, and Saturday we follow a regular order of business, which cannot be suspended except by a

two-thirds vote. The first thing in order is business on the Speaker's table. The next thing (mark it) is the motion—

That the House resolve itself into the Committee of the Whole House on the state of the Union to consider, first, bills raising revenue and general appropriation bills, and then other business on its Calendar; second, to proceed to the consideration of business on the House Calendar.

Now I submit that under this language the Speaker will hold that the motion to go into Committee of the Whole on the state of the Union is first in order, and until that is disposed of the motion to proceed to business on the House Calendar cannot be entertained. Now I propose that there shall be one day of the six on which this order will be reversed; that on Thursday it shall be first in order to move to go to the House Calendar for the consideration of general measures of reformatory legislation.

Mr. RANDALL, (the Speaker.) Mr. Chairman, the gentleman says that on Thursdays he wants to reverse the order of these motions. Now, I wish to say that under the first clause of the rule there is but a single motion—to go into the Committee of the Whole House on the state of the Union. When in Committee of the Whole House the Chairman is to recognize, first, any member moving to consider a revenue bill; next, any member desiring to consider a general appropriation bill; thereafter, any member proposing to consider in their order the various bills that may be on the Calendar appropriating money. The House, if it wishes to reach the House Calendar directly on Tuesday, Wednesday, Thursday, or Saturday, has but to vote down the proposition to go into Committee of the Whole House on the state of the Union; and the very next motion is to proceed to the consideration of business on the House Calendar.

Mr. WHITTHORNE's amendment was rejected.

The Clerk read as follows:

RULE XXVII.

UNFINISHED BUSINESS OF THE SESSION.

After six days from the commencement of a second or subsequent session of any Congress, all bills, resolutions, and reports, which originated in the House, and at the close of the next preceding session which remained undetermined, shall be in order for action, and all business before committees of the House at the end of one session shall be resumed at the commencement of the next session of the same Congress in the same manner as if no adjournment had taken place.

Mr. BLACKBURN. Mr. Chairman, before moving the committee rise, I wish to ask unanimous consent for the Committee on Rules to return to Rules XXIII and XXIV in order to offer thereto certain amendments which were agreed to by the committee, and which would have been offered when those rules were under consideration but for the fact the clerk of that committee was necessarily absent during that day. They are not material, but they are valuable in the judgment of the committee, and I ask unanimous consent for the committee that it may return to these two rules to submit such amendments as have been unanimously agreed to.

A MEMBER. And no other amendment.

Mr. BLACKBURN. Yes, sir; and no other than those agreed to by the Committee on Rules. I will state for the information of the committee, neither one of those amendments has yet been offered or considered by the House.

The CHAIRMAN. The Chair will suggest if the amendments are now ready it will be better to let them be read.

Mr. BLACKBURN. I will ask the five amendments be printed in the RECORD to-morrow morning.

Mr. CLYMER. I reserve the point of order.

The CHAIRMAN. Does the gentleman reserve the point of order on the right of the committee to go back?

Mr. CLYMER. I do. I am perfectly willing they should be printed, but I desire to see or hear them before I consent to their being offered.

Mr. BLACKBURN. I withdraw the request, and, in my own right and under instructions of the Committee on Rules, will offer them in the House.

Mr. CLYMER. The gentleman will understand I do not wish to antagonize the Committee on Rules.

Mr. BLACKBURN. Then I cannot understand the action of the gentleman at all. I move the committee rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had, according to order, had under consideration the proposed revision of the rules reported from the Committee on Rules, and had come to no resolution thereon.

FEBRUARY 27, 1880.

REVISION OF RULES.

The motion of Mr. BLACKBURN was then agreed to.

The House accordingly resolved itself into Committee of the Whole on the state of the Union, Mr. CARLISLE in the chair.

The CHAIRMAN. The House is now in Committee of the Whole for the further consideration of the report of the Committee on Rules. The Clerk will read,

The Clerk read as follows:

RULE XXVIII.

CHANGE OR SUSPENSION OF RULES.

No standing rule or order of the House shall be rescinded or changed without one day's notice of the motion therefor, and no rule shall be suspended except by a vote of two-thirds of the members present, nor shall the Speaker entertain a motion to suspend the rules except on every Monday after the call of States and Territories shall have been completed, and during the last six days of a session.

Mr. RANDALL, (the Speaker.) The Committee on Rules have agreed upon certain amendments to be proposed to this rule. Those amendments were placed in the charge of the gentleman from Maine, [Mr. FRYE,] but I do not see him in his seat at this time.

Mr. BLACKBURN. I will ask that the amendments referred to by the gentleman from Pennsylvania [Mr. RANDALL] be allowed to be offered hereafter.

Mr. HARRIS, of Virginia. I have an amendment to offer to this rule.

The CHAIRMAN. The Chair will first entertain the amendments recommended by the Committee on Rules.

Mr. RANDALL, (the Speaker.) I see that the gentleman from Maine [Mr. FRYE] is now in his seat.

Mr. FRYE. I am instructed by the Committee on Rules to propose the amendment which I send to the Clerk's desk.

The Clerk read as follows:

Strike out the words "every Monday" and insert in lieu thereof the words "the first and third Mondays in each month," and after the word "completed" insert the words "preference being given on the first Monday to individuals and on the third Monday to committees;" so that it will read:

"No standing rule or order of the House shall be rescinded or changed without one day's notice of the motion therefor, and no rule shall be suspended except by a vote of two-thirds of the members present, nor shall the Speaker entertain a motion to suspend the rules except on the first and third Mondays in each month, after the call of the States and Territories shall have been concluded, preference being given on the first Monday to individuals and on the third Monday to committees, and during the last six days of a session."

Mr. FRYE. It will at once be seen what this amendment will effect if adopted. It will leave all the Mondays but two in each month for useful business and legislation. Under the present rule motions for suspension of the rules can be made on every Monday. Now, few gentlemen in this House have failed to see what the effect of such a rule as that has been. After the States and Territories have been called on Monday for the introduction of bills for reference, motions to suspend the rules have been in order. And since I have been in Congress the result has been that two-thirds of the time on each Monday has been utterly and entirely wasted.

In the first place, it is understood that any gentleman under the present rule may bring before the House any resolution he may see fit, and compel us to vote upon it. Political resolutions are in order, and to prevent their being offered to the House every now and then we adjourn immediately after the call of States has been completed, and the remainder of that Monday is wasted.

During this session of Congress the gentleman from Iowa [Mr. WEAVER] has been endeavoring to get a resolution before this House. Four or five times the House has adjourned on him, and finally the Speaker, exercising a right which he has the authority to exercise, and performing a duty which I think he ought to have performed, has given the floor for motions to suspend the rules to committees who have unanimously made such a request rather than to individuals. In that way three or four committees have been able to get propositions before the House for consideration. But all the rest of the Monday after the morning hour has been wasted. That will be the history of Mondays during this whole session of Congress unless a change is made in the rule.

It seems to me that we have been sent here for some useful purpose, to do some good, not to be compelled to go upon the record on foolish propositions, on propositions the majority of which are mere humbug propositions—simply, thin attempts at demagoguery. That is true of two-thirds of the individual resolutions which have been offered on Monday.

The Committee on Rules propose to give to individuals one Monday in every month, and to committees one Monday in every month for motions to suspend the rules. In that way the gentleman from Iowa [Mr. WEAVER] will at any rate have one Monday in a month when his resolution would be in order, and the committees would have another Monday. The Committee on Rules have recommended this amendment in the interest of legislation.

Mr. HARRIS, of Virginia. I will ask the Clerk to read an amendment which I have prepared, and which I think will accomplish the very purpose referred to by the gentleman from Maine, [Mr. FRYE.] His argument goes to show that the House ought not to be compelled to entertain propositions that do not look to actual legislation. We have all witnessed the scenes to which he has referred. The House of Representatives, almost like a parcel of school-boys, meet and adjourn again and again, because some gentleman entitled to the floor proposes to offer a resolution expressing a mere opinion, a mere catch resolution, proposing no legislation if it shall pass. To avoid that the House has presented the spectacle to the country of adjourning in order to prevent members from being called upon to vote on a proposition which when voted upon would amount to nothing, and if adopted would be only an expression of opinion and can result in no practical legislation.

I have prepared an amendment which will cut off on every Monday these resolutions looking alone to mere expression of opinion, and not leading to any useful legislation for the country.

Mr. STEVENSON. I would like to ask the gentlemen whether it is not proper for the House of Representatives to express an opinion upon questions of public interest, even if no legislation is contemplated?

Mr. HARRIS, of Virginia. I think the House of Representatives has no business to express opinions which neither influence any one nor instruct any one. We have a right to call for information from those who can give it; my amendment would not cut off such resolutions. And we have a right to adopt practical resolutions which look to practical results in legislation. But that Congress should erect itself into a body to express opinions, not in the form of law, is, I think, conducive to no public good and certainly no private interest. For this reason I propose the amendment which I have sent to the desk.

The Clerk read as follows:

But the Speaker shall not entertain a motion to suspend the rules on Monday to consider a resolution or proposition merely expressing the opinion of the House upon the question proposed.

Mr. HARRIS, of Virginia. I shall offer this amendment at the proper time.

The CHAIRMAN. It would not be in order now. The question is on the adoption of the amendment proposed by the gentleman from Maine [Mr. FRYE] by instruction of the Committee on Rules.

Mr. RANDALL, (the Speaker.) The Committee on Rules are unanimous in favor of the amendment of the gentleman from Maine.

The amendment of Mr. FRYE was agreed to.

Mr. HARRIS, of Virginia. I now offer the amendment which has already been read.

Mr. FRYE. If the gentleman will withhold his amendment for a moment—

Mr. HARRIS, of Virginia. I will do so.

Mr. FRYE. I have two amendments which I am instructed to offer by the Committee on Rules, and which, if adopted, may do away with the necessity for the amendment of the gentleman from Virginia. I move to insert the following as clause 2 of Rule XXVIII:

All motions to suspend the rules shall, before being submitted to the House, be seconded by a majority by tellers, if demanded, as in the case of the previous question.

A rule similar to this was adopted in the Forty-Third Congress, I believe. Why it was given up I do not know. I remember that it worked well during that Congress.

The CHAIRMAN. The Chair will take the liberty of suggesting that these new rules, if adopted, will not require the previous question to be seconded by a majority.

Mr. RANDALL, (the Speaker.) Let the concluding words of the amendment, "as in the case of the previous question," be struck out.

Mr. FRYE. I modify the amendment in that way.

Mr. McMAHON. Mr. Chairman, I concur in a great deal that has been said about "buncombe" resolutions offered on Monday, but I think this House had better be a little careful before it deprives itself of an important power. I do not speak now particularly of the present Congress or the committees of the present Congress. I acknowledge that in this Congress and in the last Congress the committees have been liberal, and have in many cases reported bills adversely in order to get them before the House, even when the committee did not concur in the opinion of the proposer of the bill.

Mr. RANDALL, (the Speaker.) The gentleman will allow me to suggest that an adverse report does not prevent a bill from coming before the House.

Mr. McMAHON. The Speaker does not understand my proposition. Take the case as it was in the Forty-fourth Congress. If any one thing was plain in the course of the Forty-fourth Congress, it was that committees "sat down" upon public measures and private measures—gave the House no opportunity to vote even when two-thirds might be in favor of a particular measure.

Now, I for one despise the mere political part of the proceedings of Monday; but as a Representative I would like to see this House preserve to itself, untrammelled by too many votes, (and this proposition brings in another vote,) the right to instruct a committee as the sense of the House to report at an early day some bill which is pending before the committee. We ought not to create any restriction in this respect.

Mr. RANDALL, (the Speaker.) If a majority cannot be obtained to second a proposition for suspension of the rules, of course a two-thirds vote for suspension cannot be obtained.

Mr. McMAHON. But the point is this: when you have a count by tellers, motions to adjourn, &c., you waste the only day in a whole month upon which individuals can have an opportunity to present these propositions. I want gentlemen to consider whether we ought not to preserve to ourselves the right to have one day in a month on which we can take the sense of the House—not merely for purposes of political effect but for the purpose of expressing the opinion of the House upon a question of legislation, or for the purpose of instructing a committee to report a bill which the committee may be disposed to smother.

Mr. RANDALL, (the Speaker.) Mr. Chairman, the excuse hereto

fore given by committees for the omission to report has been a just one—that they have not had the opportunity. The committees, in other words, have been but rarely called during the morning hour because it has been consumed in debate, as we have seen has been the case recently. Now, the Committee on Rules in this revision have proposed an alteration in this respect. They have recommended that the morning hour be confined to the presentation of reports from committees. Under the operation of this rule, in my judgment, no committee of this House will fail to have an opportunity to report the measures submitted to its judgment. This is an immense advantage.

As to this suspension of the rules on Monday, if a majority vote cannot be obtained to second the motion, of course two-thirds will not vote for the suspension. Hence in the judgment of the Committee on Rules it appeared proper that a proposition on which a two-third vote is required should first be seconded by a majority vote on a count by tellers before the question on suspension, requiring a two-third vote, should be taken.

Mr. DAVIS, of North Carolina. I rise to a parliamentary inquiry. The gentleman from Maine [Mr. FRYE,] from the Committee on Rules, has offered an amendment which has been adopted. Now, suppose any member should desire to offer an amendment to come in at the end of that amendment, will he be precluded by the course pursued in yielding to members of the Committee on Rules to submit amendments.

The CHAIRMAN. The Chair would not, unless instructed by the committee, exclude gentlemen from offering amendments to this, because the practice has been always to take the question first on amendments offered by the committee.

Mr. RANDALL, (the Speaker.) The committee does not desire to restrict any amendment in any way.

Mr. GILLETTE. I would like to inquire whether this privilege of moving suspensions of the rules on Monday does not also include the privilege of moving suspension of the rules for the introduction of individual bills as well as for the introduction of resolutions?

Mr. RANDALL, (the Speaker.) Anything, of course.

Mr. GILLETTE. So I understand it. I would like to inquire whether this is not the only door open, if it is open, to an individual who is in the minority in this House and wishes to bring some measure before this body for action—whether this is not the only opportunity he can have to do it, unless some committee is willing to report his measure to the House?

The CHAIRMAN. That is not a question addressed to the Chair.

Mr. GILLETTE. Will the Chair let me address the question to our honorable Speaker?

Mr. RANDALL, (the Speaker.) It is a plain case. The committee were unanimous in giving the opportunity on one of these Mondays to individuals to present measures for suspension, motions for suspension to pass a bill, or to consider it, or to adopt a resolution or opinion, or anything else, if they can get the proper vote in the House to do it. The object, really, of the committee is to give always two Mondays to general legislation, and in the months where there are five Mondays we, of course, gain another Monday.

Mr. GILLETTE. This last proposed amendment simply takes one more step, puts one more impediment in the way of an individual who has not the opportunity of reaching the House through committees—prevents his getting any measure before the House, whether resolution or bill. And I protest, in the interest of districts which are in the minority, whose Representatives have no opportunity through committees to reach this House—I protest, I say, against any measure which in the least impairs this one day in the month and prevents an individual member from getting his business brought forward.

Mr. RANDALL, (the Speaker.) Under the practice of having individuals recognized individuals might not get one day in the month, but the committee have opened the door so they shall have one Monday in the month.

Mr. BRAGG. I move to strike out the last word. I have not endeavored to enlighten this House on the subject of these rules during the last two months, but I have listened to the discussion of the rules with some interest; and now that we have come to the consideration of this rule I see, from my little experience, a great evil from the legislation which has grown up under it. I have seen that evil admitted on this floor this morning, and admitted by the Committee on Rules. But instead of giving it heroic treatment, they are endeavoring to compromise with it and still let the root of the evil live.

One gentleman has objected to the rule authorizing suspension of the rules because it propounds to this House suddenly political conundrums, having no effect except to embarrass the members of the House who are to vote on them. Another gentleman, representing the Committee of Claims, has protested the suspension of the rules because it permitted demagoguery to come in.

Now, sir, I protest against this rule and the suspension of the rules under it, not only as applicable to Monday but as applicable, and more particularly so, to the last six days of the session. My objection is in the interest of good, sound, conservative legislation. In my judgment, no matter ought ever to be presented to the consideration of this House for its vote, unless it be such a matter as has been first considered, digested, canvassed, and weighed by a committee of this House. I have seen, and I think every member of this body has seen

that if you will in the last six days of a session allow two-thirds of a quorum to pass bills which have never been considered in any committee at all, it requires but a very little consultation among those who are remaining to secure the passage of a series of bills which are more damaging as legislative matters than any other legislation which takes place during the entire session. And, therefore, sir, I propose to offer an amendment to this bill which shall dispose of the question of demagoguery which the gentleman from Maine spoke of, and the conundrums the gentleman from Virginia spoke of, by simply letting the rule stand as it is and adding at the end thereof "and then only," meaning the House shall suspend the rules or the Speaker shall entertain a motion to suspend the rules on the Monday and on the last six days of the session "and then only for the consideration of a bill or resolution favorably reported by a committee of the House;" or, to give the case suggested by the gentleman from Ohio, when a committee that is hostile to a bill seeks to suppress it and will not give the House an opportunity to vote on it, to instruct a committee of the House. So, with my amendment adopted, there is left a power in the House to instruct by a suspension of the rules a committee of the House on any Monday, and a prohibition on any Monday, or on the last six days of the session, to foist legislation upon the statute-books that is not respectable enough to receive the favorable consideration of the committee.

Mr. BLACKBURN. The history of this rule, Mr. Chairman, shows that a reduction has been made in the number of days on which a suspension of the rules can be had. It was originally fixed at ten days instead of six days that motions were in order to suspend the rules. That rule was adopted in 1820. It stood so until 1874. In 1874 the time was reduced from ten days to six days preceding the close of the session of Congress. The Committee on Rules, so far as that limit of time is concerned, have left it just as they found it in the original rule, the shortest period known in the history of Congress.

Now, the amendment submitted by the member from Maine on the Committee on Rules, and agreed to by this Committee of the Whole, limits the right to suspend the rules on Monday to one-half when compared with what it was under that existing arrangement, for it is only upon two Mondays in the month that this motion can be submitted. Upon one of these only can it be made by a member individually, and upon the other Monday in each month it can only be moved by authority and direction of a committee. I think, sir, the Committee on Rules and the amendment offered by the gentleman from Maine, which has been agreed to, have certainly gone a good long way toward restricting the power of which the gentleman complains.

Mr. HAWLEY. Did the gentleman from Wisconsin offer an amendment?

The CHAIRMAN. Not yet.

The question was taken upon Mr. FRYE's amendment; and it was agreed to.

Mr. FRYE. Mr. Chairman, I now offer the following amendment to clause 3.

The Clerk read as follows:

When a motion to suspend the rules has been seconded, it shall be in order, before the final vote is taken thereon, to debate the proposition to be voted upon for thirty minutes, one-half of such time to be given to debate in favor of and one-half to debate in opposition to such proposition.

Mr. FRYE. That explains itself. It is simply to give members generally a chance to explain the reasons for their action, and place themselves upon the record.

Mr. BLACKBURN. It only carries, as I understand it, debate to thirty minutes, to be divided equally between the sides.

Mr. FRYE. That is all.

The amendment was agreed to.

Mr. HARRIS, of Virginia. I move to insert the following as a separate clause.

Mr. FINLEY. I hope the gentleman from Virginia will wait a moment, as I desire to offer an amendment to the first clause.

Mr. HARRIS, of Virginia. I am willing to hear it read.

Mr. BRAGG. I desire to ask a parliamentary question. The amendment which I propose to offer was to come in at the end of the rule. I understand now the proposition is to add a distinct and separate clause to the rule, as stated in the report of the Committee on Rules.

The CHAIRMAN. The Chair did not understand the gentleman from Wisconsin to send his amendment for immediate action, but with a view to having it inserted at the end of the rule, which would seem to be the most appropriate place for it, as it states the purpose for which the rules might be suspended.

Mr. BRAGG. The form of the amendment, as I have drawn it, is to add it at end of the rule.

The CHAIRMAN. Then this is a separate clause which is offered here; and it is proper that the amendment of the gentleman from Wisconsin should come in after action is taken upon this or any other matter which may be added to the rule, since his proposed amendment is a limitation upon the purpose for which the rule can be suspended.

Mr. HAWLEY. Are we going back to the first clause of the rule?

The CHAIRMAN. The Chair has announced that having entertained the amendments offered by the Committee on Rules, he will

give other gentlemen the privilege of offering amendments to this rule.

Mr. HAWLEY. I understand that the committee has perfected the rule and made three clauses. Now, do we go back and begin at the first clause?

The CHAIRMAN. The Chair will entertain amendments to the first clause.

Mr. FINLEY. I offer the following as an amendment.

Mr. HARRIS, of Virginia. I only yield to allow the proposed amendment to be read.

The Clerk read as follows:

After the word "Monday" insert "or on the first and third Tuesdays if no session is held on Monday."

Mr. FINLEY. That is pertinent to the first clause of the bill.

Mr. HARRIS, of Virginia. I ask the Clerk now to read my amendment.

The Clerk read as follows:

But the Speaker shall not entertain a motion to suspend the rules on Monday to consider a resolution or proposition merely expressing the opinion of the House on the question proposed.

Mr. HARRIS, of Virginia. My amendment is offered as an addition to the rule offered by the gentleman from Maine, [Mr. FRYE.] It is very narrow. It does not interfere with legislation. It does not interfere with a joint resolution in the nature of a bill. It does not interfere with a resolution of instruction to a committee. It does not interfere with a resolution of inquiry addressed to any of the Departments. It does not interfere with practical legislation or with the expression of opinion of the House on any practical question before the House or before either body. But it simply prevents the Speaker from entertaining a motion to suspend the rules to express an opinion upon a mere abstract question; the vote upon which, if unanimous, amounts to nothing but an expression of opinion. It interferes with no call for information. It interferes with no demand for a committee to report; for that is practical legislation. A resolution instructing a committee to report would not be covered by that amendment.

As the matter now stands, while the committee have tried to restrict this thing that we witness every Monday to only two Mondays in the month, you will find practically that has not been done. There is a provision in the amendment just adopted that a majority shall second the motion. Now, what will be the effect if gentlemen do not want to vote on the question? Suppose my friend from Iowa [Mr. WEAVER] should offer his resolution and demand tellers under this new rule. If the motion were seconded, then at once some gentleman would move that the House adjourn, to get rid of voting on the question. We would have the same scenes over again that we have witnessed here from time immemorial.

Therefore I think my amendment should be adopted, in the interest of economy of time, and in the interest of legislation, and to put a stop to this constant system of introducing resolutions, whether for buncombe or for personal motives or for what not; resolutions at least that do not amount to business of a practical character for the interests of the country.

Mr. BRAGG. I offer as a substitute for the amendment of the gentleman from Virginia what I send to the desk.

Mr. LOWE. I have risen to oppose the amendment of the gentleman from Virginia.

The CHAIRMAN. The Chair will give the gentleman from Alabama an opportunity to be heard in due course. The Clerk will report the amendment offered by the gentleman from Wisconsin.

The Clerk read as follows:

Amend Rule XXVIII by adding the following:

But the Speaker shall entertain no motion to suspend the rules except for the consideration of a bill or resolution favorably reported by a committee of the House, or to instruct a committee of the House.

Mr. HAWLEY. I do not see that the amendment offered by the gentleman from Wisconsin necessarily conflicts with that offered by the gentleman from Virginia. I think it should rather be offered as a separate clause. I do not see the necessity of substituting it for the amendment offered by the gentleman from Virginia. They are quite independent of each other.

I rose, however, to say, Mr. Chairman, that I had drawn a separate clause, which I propose to offer as an addition to the rule, covering very much the same ground as that covered by the amendment offered by the gentleman from Wisconsin, or perhaps a little more. I propose to offer a clause like this:

No motion to suspend the rules and pass a bill shall be entertained, unless the bill shall have been referred to a committee, reported therefrom, printed and distributed to the members at least one legislative day before the motion for suspension be made.

Now, I care less about so much of that as calls for a reference to a committee and a report therefrom as I do about that part which calls for a printed copy of the bill. That part of it I should strenuously urge.

I comprehend the feelings of the gentleman from Iowa, [Mr. WEAVER,] who, in a minority on some topics, is anxious to be heard. But I would suggest to the gentleman from Iowa that he can be heard practically by offering amendments to bills as they are in progress through the House. If he has ideas that he thinks of importance to the country it is hardly worth while to spend an hour calling the roll

upon them unless he can get a majority of the House to embody his views in practical legislation. But if he desires simply to test the sense of the House he can do so equally well by offering an amendment to some bill which may be under discussion in the House.

I sympathize with the honest purpose of a small minority to get an expression of their views, but I do very much object to bringing in a bill here in manuscript on Monday and rushing it through. I do not know whether I shall refer to a particular case or not. But let us suppose that a bill has been before a committee in one Congress and could get no report in its favor; that it has been brought before another committee in a second Congress and could not get any report in its favor, and then in a third Congress it has been brought before a committee which no one would ever suspect had charge of such a measure, and then it was brought before the House in manuscript and carried through under a suspension of the rules. That is what I object to.

Mr. McLANE. Will the gentleman permit me to ask him how, in the case he supposes, the gentleman from Iowa [Mr. WEAVER] could get his views submitted to the House by an amendment?

Mr. HAWLEY. What I said upon that point was merely a side remark. The purpose I have in view is that no bill, unless it has been referred to a committee and reported therefrom, and unless it has been put in print and distributed, shall be allowed to take up time on Monday. And, by the way, that clause is in the new constitution of Pennsylvania, which is supposed to be a model document. That constitution provides that no bill shall be passed under a suspension of the rules, or in any other way, unless it be referred to a committee and reported therefrom.

If the gentleman from Wisconsin [Mr. BRAGG] is content to have added the idea of printing and distributing bills, he and myself might wait and submit the proposition as a separate clause. I will not submit it now, but will defer it for the present.

Mr. LOWE. I am opposed to the amendment of the gentleman from Virginia [Mr. HARRIS] because I think that in itself and of itself it reflects upon this House. He seems to think that certain members of the House have two platforms concealed about their persons, and that they are unwilling that any bill of discovery or search warrant in the nature of a resolution on Monday should go through their political consciences and show the people that they talk one way at home and act another way here. Now, sir, in the consideration of these proposed rules we have been drifting day by day farther and farther from individual responsibility to the people. The House is no longer democratic; it is an oligarchy of rules, dominated by the Speaker, and such a thing as individual responsibility is unknown here. The committees are responsible, the majority of the members of the House is responsible; but the individual is lost in the action which results from the organization of the House.

What are you afraid of? Is it the banks, or the railroads, or the protectionists? Do you dread the syndicate or the corporations? Shades of Jefferson and Jackson! Where is the honesty and courage which once characterized your party? It has gone, and we have nothing but trickery and truculence.

Now, I am like every man who is in a minority; I exalt personal liberty, and oppose the powers that be. I do it in sheer self-defense. I do not want to be ignored or suppressed. I represent here a constituency as honest and as intelligent as any other constituency. And I want an opportunity under the rules to test the sense of this House upon questions that are before the country. I have no sentiment or opinion here which I seek to conceal or hide away from the people at home. And I have no sympathy or feeling in common with the demagoguery and cowardice which hopes to escape responsibility by evasion and silence.

Heretofore we have had the right, each member, to bring his views before the House and the country; but lately, under the practice of the Speaker, we have been denied that right. And we now understand that under the rules of the House, to be deliberately adopted for that express purpose, individuals are to be suppressed or ignored, and nobody is to be heard here upon any politico-economical question during this session pending the presidential election. That is the whole of it, and we want the country to so understand it.

Mr. HARRIS, of Virginia. One word in reply to my friend from Alabama, [Mr. LOWE.] I assure him and the committee that I had not the slightest reference to persons or to parties. My amendment was wholly in the interest of economy of time and practical legislation.

Mr. WEAVER. Will the gentleman allow me to ask him a question?

Mr. HARRIS, of Virginia. Certainly.

Mr. WEAVER. I understand the gentleman to say that he has not the slightest reference to either persons or parties. Now, I ask him if he did not mention my name in his remarks?

Mr. HARRIS, of Virginia. I mentioned the gentleman's name for the reason that it had been before referred to to illustrate the proposition that the House had adjourned in order to avoid voting on a certain question. Now, I am willing to vote on that question.

Mr. WEAVER. Does the gentleman think that more time would be lost by voting on the resolution than would to adjourn?

Mr. HARRIS, of Virginia. If the gentleman will introduce a bill for action, instead of a mere clap-trap or buncombe resolution, he will not find me unwilling to vote on it.

Mr. WEAVER. The clap-trap and buncombe come in on the stump in the gentleman's district, and in other districts where members express one thing and then in this House act another.

Mr. HARRIS, of Virginia. If such a resolution as the gentleman refers to should pass it would amount to nothing more than a resolution adopted by a town meeting in his district. I am opposed to taking up the time of this House in discussing and voting on a resolution which, if adopted, will amount to nothing. If the gentleman wants to have a law passed on the currency question, let him bring in a bill that can be voted upon, and which, if passed, will have the effect of law. It is to avoid voting on this sort of stuff which is brought before the House that members adjourn, and to prevent the necessity for that I have offered my amendment.

Mr. WEAVER. I move to strike out the last word. It is well understood by the gentleman from Virginia [Mr. HARRIS] and by this entire House, and it is becoming well understood by the country, that it is not a bill that he wants or that this House wants, for there are several bills pending before committees of this House, introduced by myself and others, which do bring up that very question. But the committees are so managed that those bills are smothered and cannot be brought to the light of day. The gentleman well understands this, and so does the whole country.

And then when I seek or any other member of this House seeks to introduce a resolution in order to present the very principle which is contained in these bills, and in which the country takes the deepest interest, such a resolution is called clap-trap. Sir, the clap-trap is used before the people on the stump to make them believe that a particular member is in favor of one thing, and then when he comes into this House he is found to be in favor of tabooing that very principle by indirection through the machinery of a committee of this House. I am astonished to hear such gentlemen claiming to represent the democracy of this country, when it is well known that ninety-nine out of every hundred of the democratic party west of the Alleghany Mountains are in favor of the principles contained in the resolutions which have so frightened this House for five weeks, and which I now send to the Clerk's desk to have read as a portion of my remarks. [Laughter and applause.] I want the country to understand that these gentlemen, when these resolutions are sought to be brought before this House, call them clap-trap and humbug; but they are the soundest doctrine imaginable at home on the stump.

The Clerk read as follows:

Resolved, That it is the sense of this House that all currency, whether metallic or paper, necessary for the use and convenience of the people, should be issued and its volume controlled by the Government, and not by or through the bank corporations of the country; and when so issued should be a full legal tender in payment of all debts, public and private.

Second. Resolved, That in the judgment of this House, that portion of the interest-bearing debt of the United States which shall become redeemable in the year 1881, or prior thereto, being in amount about \$792,000,000, should not be refunded beyond the power of the Government to call in said obligations and pay them at any time, but should be paid as rapidly as possible, and according to contract. To enable the Government to meet these obligations the mints of the United States should be operated to their full capacity in the coinage of standard silver dollars, and such other coinage as the business interests of the country may require.

Mr. WEAVER. Now I can well understand why it is that the leaders of the democratic party, being in the East for hard money and in the West for soft money, do not wish to be put on record upon resolutions of this kind on the eve of a presidential election. I understand that very well. But these resolutions are now before the country, and I shall be found standing here inserting the thorn in the flesh every Monday from now until the adjournment of Congress, unless sooner gratified, seeking recognition. I am determined that gentlemen in this House shall be put upon the record on those resolutions and their public professions tested.

Mr. HARRIS, of Virginia. Will the gentleman tell us whether he voted for the amendment of the gentleman from Texas [Mr. MILLS] providing that all propositions touching coinage and currency might be put on appropriation bills as "riders?"

Mr. WEAVER. I will answer that question. I stand here as an humble representative of the greenback party, opposed to putting any "riders" on appropriation bills, whether State-rights "riders" or greenback "riders." [Applause.] I want every bill to come up on its merits. The gentleman and his political associates had better recede from their idea of putting political "riders" on appropriation bills, or there will not be enough of the democratic party left after the next election to form a corporal's guard. [Laughter and applause.] It is neither true democracy nor wise legislation.

Mr. RANDALL, (the Speaker.) Now I suggest that we go on with the rules. The pending question was upon the amendment of Mr. BRAGG to amend Rule XXVIII, by adding the following:

But the Speaker shall entertain no motion to suspend the rules except for the consideration of a bill or resolution favorably reported by a committee of the House, or to instruct a committee of the House.

The amendment was not agreed to.

The question recurred on the amendment of Mr. HARRIS, of Virginia, to add to the pending rule the following:

But the Speaker shall not entertain a motion to suspend the rules on Monday to consider a resolution or proposition merely expressing the opinion of the House upon the question proposed.

The amendment was not agreed to, there being ayes 14, noes not counted.

The CHAIRMAN. The gentleman from Ohio [Mr. FINLEY] sent to the desk some time ago an amendment, which is now in order, and will be read.

The Clerk read as follows:

After the word "Monday" insert "or on the first and third Tuesdays, if no session is held on Monday."

Mr. FINLEY. I ask that the Clerk read the rule as it will stand if this amendment be adopted.

The Clerk read as follows:

No standing rule or order of the House shall be recinded or changed without one day's notice of the motion therefor, and no rule shall be suspended except by a vote of two-thirds of the members present, nor shall the Speaker entertain a motion to suspend the rules except on the first and third Mondays of each month, preference being given on the first Monday to individuals, and on the third Monday to committees; or on the first and third Tuesdays, if no session be held on Monday, after the call of the States and Territories shall have been concluded, and during the last six days of the session.

Mr. FINLEY. I desire to say only a word upon this amendment. Under the rule as now amended the Speaker is not at liberty to recognize motions to suspend the rules except on two Mondays in each month. Now, it occurs to me that when there is no session of the House on Monday we should not by that fact be deprived of the benefits of the rule.

The question being taken on the amendment of Mr. FINLEY, it was not agreed to; there being—ayes 16, noes 54.

Mr. SCALES. I move to amend by inserting the following at the end of the first clause:

But the Speaker shall not at any time, except during the last six days of a session, entertain a motion to suspend the rules and pass a bill making appropriations for the improvement of rivers and harbors, or any general appropriation bill.

I do not think it necessary, Mr. Chairman, to discuss this amendment. I believe it explains itself; and I hope it will commend itself to the House.

Mr. DAVIS, of North Carolina. I move to amend the amendment of my colleague [Mr. SCALES] by adding thereto the following:

And no bill appropriating money to the amount of \$5,000 or more shall pass under a suspension of the rules, except upon the call of the yeas and nays upon the passage of such bill.

Mr. Chairman, it was objected the other day that if an amendment which was offered by me at that time proposed substantially what is now sought to be obtained should pass, the House might not on some occasion have time to get through with its business. I desire to say, sir, that any measure that ought to pass this House ought to be considered, and if we have not time to consider it fairly, then we ought not to be allowed time to pass it. I think one of the greatest evils which has attended our legislation has resulted from the passage of bills involving millions of money, passed through this House under a suspension of the rules, when there was no time to consider, no time to amend, and when the yeas and nays were not allowed to be called. The gentleman from Alabama will have an opportunity, if this amendment passes, of having it known to the country who it is who votes "ay" and who it is who votes "nay" on any bill involving the appropriation of money to the amount of \$5,000 or more.

It is not objectionable on the score of economy of time, inasmuch as small bills involving the appropriation for pensions and the like, less than \$5,000, may still pass under a suspension of the rules; but wherever the amount exceeds \$5,000 cannot, if this amendment is adopted, and in my judgment ought not pass.

Mr. HAWLEY. I suggest to the gentleman that perhaps his object is already attained if he will reflect the Constitution of the United States beyond and above our rules secures to one-fifth of the members present the right to have the yeas and nays called on any question. If this House cannot be trusted with that it cannot be trusted at all. If a bill goes through here without men enough to call the yeas and nays the supposition is it is a matter of great general necessity and propriety. One-fifth can always have the yeas and nays called.

The amendment to the amendment of Mr. DAVIS, of North Carolina, was rejected.

The question recurred on Mr. SCALES's amendment.

The committee divided; and there were—ayes 18, noes 52.

So the amendment was rejected.

Mr. TUCKER. I move the following amendment, to come in after clause 3 of the proposition of the gentleman from Maine.

The Clerk read as follows:

And the same right of debate shall be allowed whenever the previous question has been ordered on any proposition on which there has been no debate.

Mr. TUCKER. The object of the amendment is to follow to its logical result the proposition of the gentleman from Maine that where a motion is made to suspend the rules in order to pass any proposition there shall be debate allowed of fifteen minutes to each side for explanation.

So when the previous question is called on any proposition before the House upon which there has been no previous debate, the same amount of time for explanation of a measure should be allowed.

Mr. WARNER. I suggest that the time of each member should not be limited.

Mr. TUCKER. I believe the same rule adopted in reference to the suspension of the rules should be adopted on my amendment.

The CHAIRMAN. The time is divided between the opponents and advocates of the measure.

Mr. RANDALL, (the Speaker.) If I understand the object of the gentleman it is to reach a case of this sort: where the previous question has been demanded on a proposition and no debate has been had upon it, then there shall be, on the demand of any member, fifteen minutes allowed for and fifteen minutes against.

Mr. HASKELL. I only wish to say a word. I do not wish to antagonize the amendment if it is a wise one; but I suggest that we pass many and many a bill by unanimous consent where nobody cares to have any debate. We put through a dozen or fifteen in an afternoon, and if on every one of these little simple measures like pension bills or bills for increase of pension we allow anybody in the House to get up and exhaust fifteen minutes of time for and fifteen minutes of time against, I say there will be members in this House who will be willing to do it. The proposition which the gentleman contemplates is perfectly harmless might be so in case of half a dozen bills, and yet it would be exceedingly cumbersome when applied to twenty in a single afternoon.

Mr. TUCKER. I will say to my friend from Kansas that nobody need indulge in debate if he does not want to. This provides only there shall be the right on the part of the opponents of a measure to fifteen minutes of explanation, and to its advocates of fifteen minutes of reply.

Mr. HASKELL. The gentleman cannot submit a bill for passage in this House, however simple it may be, that there will not be enough of men in the House who will wish to say a word upon it. If it be a resolution like that of my friend from Iowa, [Mr. WEAVER,] of course there will be debate. There will be enough members here who will be sure to take advantage of the opportunity to debate. So under this amendment gentlemen will find that every single bill offered will take thirty minutes of time to pass it.

Mr. TUCKER. That is the reason I think the amendment should be adopted. I believe in free debate, and I do not believe in a practice which has prevailed in this House ever since I have been here and under which I have suffered with other gentlemen. I do not believe in forcing a vote on a measure without the liberty to every man, if he wants to say a word in opposition or advocacy of it, to be heard.

The amendment was agreed to.

Mr. HAWLEY. I move the following as an additional clause.

The Clerk read as follows:

4. No motion to suspend the rules and pass a bill shall be entertained unless the bill shall have been referred to a committee, reported therefrom, printed, and distributed to the members at least one legislative day before the motion for suspension is made.

Mr. HAWLEY. Individually, I am in favor of the whole of it, but I am less strenuous as to that part which requires a reference to and report from a committee, though I would not strike it out. But as to the other, I am earnestly in favor of it. I think it wrong and dangerous to permit manuscript bills to come in here without any notice whatever, and to go through under a suspension of the rules without having the bill before us for examination. This amendment requires the shortest possible time—a single day's notice.

Mr. VALENTINE. I would like to ask the gentleman from Connecticut a question. If that amendment had been in force yesterday, how would it have affected the substitute which passed here?

Mr. HAWLEY. I will answer the gentleman; I would just as lief answer it as not. We should have had to wait another day. That would not have killed anybody. But we did not pass that bill under a suspension of the rules; it was simply a substitute for a pending bill.

Mr. FRYE. I would like to have that amendment read again.

The amendment was again read.

Mr. VALENTINE. I move to strike out the words "reported therefrom."

Mr. FRYE. The gentleman means to apply that to the last six days of the session as well as to Monday.

Mr. HAWLEY. It makes no exception.

The question recurred on Mr. VALENTINE'S amendment to the amendment.

The committee divided; and there were—ayes 17, noes 7.

So the amendment to the amendment was agreed to.

Mr. SAPP. I suggest an amendment to the amendment by inserting the word "public" to bill, so that it will not apply to private bills, which cannot be printed until reported from the committee.

The committee divided; and there were—ayes 26, noes 21.

So the amendment to the amendment was agreed to.

The question then recurred on the amendment of Mr. HAWLEY as amended.

The committee divided; and there were—ayes 46, noes 20.

So the amendment, as amended, was agreed to.

Mr. HOUSE. I offer the following as an independent rule, to come in after the rule which has just been adopted.

The Clerk read as follows:

When a bill, resolution, or proposition of a public character has been referred to a standing or select committee of the House, and the committee shall fail for fifty days to make any report to the House thereon, it shall be in order on any Monday immediately after the expiration of the morning hour to move to discharge a committee from the further consideration of the same, which motion shall then be considered; and if decided in the affirmative, the bill, resolution, or proposition shall be placed on the proper calendar unless the majority of the House shall determine then to consider the same.

Mr. HOUSE. The proposition embodied in the rule I have just proposed is similar to the one offered a few days ago by the gentleman from Kentucky, [Mr. OSCAR TURNER.] I think, Mr. Chairman, under the present rules of the House the committees of this House have a power that they should not have in a representative government. A committee of this House, under the rules as they stand, can defeat the consideration of any measure, although a majority of the House and a majority of the American people may be in favor of that measure. They can defeat it by refusing to report upon it. Why, we heard but the other day from the chairman of the Committee on Commerce that a measure before that committee of great importance to the entire country, a measure which I believe would receive a large majority of the votes of this House—we were informed, I say, by him that he was denied the privilege in that committee of making even an adverse report upon it to the House.

Now, sir, I wish to know if the representatives of the people here intend to perpetuate a rule which prevents them from acting upon the wishes of a majority of the House. Ought any committee of this House to have that power? Ought any committee to be able to deprive the entire members of this House of their right to act upon any proposition? Suppose the people of this country want a measure passed and a majority of their Representatives here are willing to vote upon it: Now under such circumstances should a committee of this House have the right or the power to withhold from them that privilege?

It think not, Mr. Chairman. I do not believe that any gentleman here is prepared to surrender his right as a Representative in that way. We all know that measures of vast importance are frequently intrusted to these committees, and that week after week and month after month goes on and no report comes from them, perhaps none during the entire Congress.

Now, I propose that every measure shall be given a fair opportunity before this House, so that the members can express their views upon it at least by their votes. There can be no inconvenience or evil resulting from the adoption of this rule. When a motion is made to discharge a committee from the further consideration of a measure on which they have failed for fifty days to report, if the House votes down the motion, well and good. This only gives them that privilege. But if a majority of the House want to consider the measure, notwithstanding the failure of the committee to report it, they ought to have the power, and no man who represents the people here ought to put himself down as opposed to such a proposition.

Sir, it ought to pass, and I hope it will pass.

The CHAIRMAN. The question is on the adoption of the amendment offered by the gentleman from Tennessee, [Mr. HOUSE.]

Mr. WRIGHT. I move to amend the amendment by striking out "fifty days" and inserting "thirty days."

The CHAIRMAN. That would not be in order, the committee having already rejected a proposition embracing the thirty days.

Mr. WRIGHT. I move to strike out "fifty" and insert "forty." I offer the amendment upon this principle, that that is time enough for the consideration of any subject that may be brought before any committee of this House. During my long service in the Congress of the United States I have seen, in my judgment, more wrong arising from sending measures to a committee and smothering them there than from any other thing connected with legislation. I know at the present Congress, when measures have been sent to a committee, the threat has been made that those measures would never again come out of the committee.

I think, sir, that a majority of the members of this House ought to have the control of any subject of legislation which is brought before the House. They ought not to refer a measure to an inferior number than the members who compose the House and give that inferior number the power to conceal the measure. It is sent to a committee for the purpose of being considered; and why is it necessary that there should be more than thirty days for the consideration by a committee of any subject that may be sent to it?

I hope, therefore, the amendment I have offered will be adopted. If the Committee of the Whole will not agree to that I will vote then for the proposition offered by my friend from Tennessee. I am willing to take a fixed time. I will take forty days. I will take fifty days. If we cannot fix upon fifty I will take sixty days. But let us fix upon a time when a matter sent to a committee shall come out of that committee. Let it not be a place to bury up matters. A measure is sent to a committee to be investigated and examined, not suppressed. It surely ought not to be the object and purpose of a committee of any legislative body to regard itself as an instrument for suppressing measures of legislation instead of acting upon them.

Mr. RANDALL, (the Speaker.) A general provision of this sort, if made, would be impracticable of execution. If the gentleman from Tennessee wants to get any particular description of legislation out from a committee let him include in this proposition revenue measures, for example, or finance measures. But let us not make a general provision that when a committee has had possession for thirty or fifty days of a bill it shall come out of that committee. Take, for instance, the Judiciary Committee. This proposition if adopted might bring every bill out of that committee. I know exactly what the gentleman wants to reach. He wants to reach revenue measures relating to the tariff, and finance measures relating to the currency of the country; and if he would confine his proposition to those two subjects then it would be less objectionable than making it a general

coop to include every description of legislation. I agree, however, in the general principle the gentleman suggests, that measures of legislation should have a hearing in the House.

Mr. TOWNSHEND, of Illinois. I do not want to open the way to throw this House into confusion, or to do anything that would result in any unwise legislation. My one object is to procure a consideration by the House of wise and meritorious measures.

The bill referred to by the gentleman from Tennessee, [Mr. HOUSE,] the bill in regard to interstate commerce, is one, in my judgment, of more merit than any which has been submitted to the Forty-sixth Congress. And I believe to-day, if it could be submitted to the popular vote in this country, it would receive a larger majority than any measure which has been brought into this Congress. I am satisfied further, Mr. Chairman, that notwithstanding a majority of the Committee on Commerce has obstructed the will and has seriously injured the interest of the vast majority of the people of this country—I am well satisfied a large majority of the members of this House are in favor of a measure of that nature.

What has been the result? Because that committee has a majority hostile to that measure we are deprived of the opportunity and the people are deprived of the privilege of being heard upon it. What I want to do is to get some sort of rule adopted by which we can put aside the majority of that committee and allow the majority of this House to have something to do with regard to the legislation of the country. That is my object.

Now one word further. We do not propose here to send to the public Calendar all measures that have been introduced and referred to committees. We propose to give ample time to the committees to consider the measures coming before them. But if the committees will not consider those measures after fair and full opportunity we then want the opportunity for a majority of the members of this House to consider them. Gentlemen who oppose this amendment argue, it seems to me, that a majority of a committee are wiser than a majority of this House. I have more faith in the judgment of the majority of this House than I have in the judgment of a majority of any committee composed by it. And for that reason I simply desire to have the way opened by which we can obtain the opinion of this House upon important measures. We do not propose to bring these bills back without having the will of the House expressed. The amendment, as I understand, contemplates that after the expiration of fifty days the question shall be submitted to the House as to whether the bill shall go upon the public Calendar or not. And I would rather trust—I say in conclusion, as I see the hammer in the Chairman's hand about to fall—I would rather trust the collective wisdom of the majority of this House than I would the collective wisdom of any committee of this House.

[Here the hammer fell.]

Mr. HASKELL. I do not oppose the object stated by the friends of this measure at all. It ought to be in the power of this House to take from an unwilling committee a valuable bill. There is no doubt about that. It ought to be in the power of this House to take from a committee a bill that a few men upon that committee may desire to throttle, but which the great majority of this House may desire to pass.

But the amendment which has been proposed will reach infinitely further than the very wise and discreet purpose of the supporters of that amendment. Suppose that you give twenty days' or forty days' time for a committee to consider a bill. A committee cannot perfect any important bill that comes before this House in twenty days. Many of the bills will not be perfected by committees in forty days.

And what then will be the result? Suppose that a bill has been introduced into the House and sent to a committee. Toward the end of a session, not long before the final adjournment, when an uneasy and feverish minority happen to be in this House, perhaps a bare quorum of members present, that minority of the House will insist upon taking that bill out of the hands of the committee, although the committee may be willing to report it as soon as it can prepare it properly for reporting. Yet under this proposed rule that bill may be taken from the committee and dragged before the House in a half-baked condition. I take it that the disadvantages which would arise under the practical operation of such a rule will more than offset any advantage which gentlemen seek to gain by it.

Again, this proposed rule will open the door to a flood of subsidiary questions. Every uneasy man in this House, who feels that his bill is not being considered by a committee, every man who fancies that he has a grievance against a committee, will come before the House and make a motion to discharge that committee. Some of the members of the committee will oppose it and some will favor it. Toward the close of the session you will in that way occupy half of the time of the House upon these propositions to discharge committees.

The tendency of a majority of the amendments offered here this afternoon is to multiply subsidiary propositions, to multiply opportunities for debate, to multiply opportunities for speeches, without any real practical gain of time for the consideration of business. That I think will be the effect of this amendment.

Mr. YOUNG, of Tennessee. Mr. Chairman, in my judgment this is the most important amendment offered to the report of the Committee on Rules during the entire time that report has been under discussion and I do not think it should be lightly or hurriedly disposed of. It is designed to remedy an evil of long existence, and which, it

seems, can be reached in no other way. The proposed amendment may, like all other rules of a general character, be open to some objection, and I am willing to concede that it is. The strongest objection which has or, I think, can be offered has just been presented by the gentleman from Kansas, [Mr. HASKELL;] but even this can, I think, be easily answered.

Admit it to be true, as he claims, that bills frequently go before committees which cannot be examined and reported upon advisedly within thirty, or even sixty days; yet, if the committee having any such bill in charge were to state to the House that they had not had sufficient time to report upon it, there can be no question that more would be cheerfully granted; and if any such bill should be placed upon the Calendar under the operation of the proposed amendment, and the committee from which it was taken should signify a desire for further time in which to consider and make a report upon it, a motion to recommit would scarcely fail to take it from the Calendar and send it back to the committee. So there need be no apprehension that any very objectionable bill could be passed into a law over the opposition of a committee that had had it in charge. Only such measures as would commend themselves to the judgment of the House and the popular approval of the country would be at all likely to pass under such circumstances.

To my mind, there are reasons why this amendment should be adopted which very far outweigh any and all objections which have or can be urged against it. Some of them have been very strongly and forcibly presented by my colleague, [Mr. HOUSE.] He has just given us a most suggestive illustration of the evil it is intended to remove, in the statement he has just made, and which was previously known to the House, that on a very recent occasion the distinguished chairman of the Committee on Commerce declared himself unable to report either favorably or adversely the most important measure that has, in my judgment, been offered to the House during the present session; a measure that would undoubtedly pass by a most decided majority, and for the enactment of which the whole country has been clamoring for years. If a measure thus approved by the members of this House and thus demanded by every expression of the popular will which has reached us, can be defeated by a majority of a single committee, and that, too, over the constant and vigorous efforts of an able and fearless chairman to have it acted upon, it can easily be seen what may be the fate of other measures equally meritorious. Everybody here knows that an overwhelming majority of the people of this country desire the passage of the bill to which I refer, and yet in contempt and defiance of the clearly expressed popular will it has been defeated thus far by the action of a single committee and the House deprived of all opportunity to vote or even to be heard in its advocacy.

This is not the only instance in which a like action has been had and the will of the people and that of a majority of their Representatives on this floor been disregarded and set at defiance. The bill to remove the duty upon quinine slumbered in a committee for months, though there was a constant demand for its passage, and it would most likely have been there yet had not the gentleman from Kentucky [Mr. MCKENZIE] had the address to get it before the House and secure its passage by a two-thirds vote, under a suspension of the rules.

During my service in Congress I have seen more than a score of bills urgently demanded, as I thought, by the public interest strangled in committees without giving the House an opportunity to act upon them, so that practically the whole legislation of the country has been placed in the hands of a very few members of this body, and the remainder of them had almost as well have been at home as to be here without the power of acting upon measures which they deemed important to the public interest. Every member of this House who has been here any length of time has learned something of the agencies and appliances which have been and can be brought to bear for the purpose of influencing public legislation. If these agencies and influences are ever of an improper character they can much more easily be brought to bear upon a few than a large number of members. The lobbyist can reach a committee with less difficulty than they can the entire House. So to avoid vicious legislation that may by any possibility be secured by improper agencies, it would be safer to vest the legislative power of the country in as great a number of hands as possible, in order to increase and magnify the obstacles which these agencies would have to encounter.

The tendency of our legislation is growing more and more toward centralism and the concentration of power in the hands of the few to the exclusion of the many, and that feature is as objectionable in the rules governing this House as it is elsewhere. Legislation in a government like ours should represent the popular will, and anything which defeats that object is subversive of the highest legislative aim and duty. I warn gentlemen from two of the great sections of this country, the South and the West, that they are sacrificing the highest interest of their constituents if they defeat this amendment, for they are placing themselves completely in the power of those whose interests are antagonistic to theirs, and the time will soon come when they will be compelled for self-protection to demand the adoption of some such rule as this. A bill was introduced only yesterday by the gentleman from Illinois [Mr. MORRISON] to remodel in some measure our tariff schedule, and I desire to inform him that under existing rules and the present organization of this House he will be hoary with age before that bill ever leaves the committee to

which it was referred. I think, sir, that the most pernicious legislation of past years has found its way upon the statute-books by the faulty construction of our system of rules as they have heretofore existed, while measures of the highest importance and greatest public interest have been defeated by the same machinery, and I feel confident that the people will soon compel us to change it.

The question being taken on the amendment of Mr. WRIGHT to amend the amendment of Mr. HOUSE by striking out "fifty" and inserting "forty," it was not agreed to.

Mr. WARNER. Mr. Chairman, I move to strike out the last word. [Cries of "Vote!" "Vote!"] If I did not believe that an important principle was involved in this amendment I should not detain the committee a single moment. The whole question is, shall this House retain control over the business brought before it, or turn it over to its several committees with plenary power to determine what shall be done with it?

When we refer to the several committees matters that are introduced here, I do not understand that it is for final disposition; it certainly ought not to be. Measures are sent by the House to the committees for consideration, investigation, and report. Committees are to weigh, digest, and formulate, but ought not to have power to finally determine anything—certainly not to say a measure shall not have consideration in the House because a majority of the committee may be against it, while a majority in the House may be for it. I do not want to surrender to committees that power. I do not want to put it out of the power of the House to take up an important measure because a committee has decided not to report it back. That act of a committee ought not to preclude after-consideration in the House, provided a majority of the House, after a sufficient time has been given to the committee for action, decide to bring up the subject for review and final determination in the House. The action of a committee ought not to bar this House from the consideration of any question which a majority desire to consider. An important principle seems to me to be involved here. In making rules for the House, I do not see how we can consistently vote to give to committees the power to decide finally measures which the whole House only ought to decide. I hope, therefore, the amendment of the gentleman from Tennessee will be adopted. [Cries of "Vote!" "Vote!"]

Mr. HENDERSON. Mr. Chairman, I have no objection to the amendment offered by the gentleman from Tennessee, [Mr. HOUSE.] I want, however, to reply to a remark which the gentleman made in advocating his amendment, and which, in my judgment, is calculated to do great injustice to the Committee on Commerce. It was stated by him as a reason why such a rule as this ought to be adopted, that the Committee on Commerce—perhaps he did not name the committee, but that was undoubtedly his meaning—had the other day refused to allow the chairman of that committee to make an adverse report to the House.

Mr. HOUSE. I understood the chairman of the Committee on Commerce to so state on the floor.

Mr. HENDERSON. I do not object to his statement. I desire to say that if it is stated here or elsewhere that the majority of the Committee on Commerce have acted in any improper manner in regard to the bill referred to, or any other, I deny the imputation. I voted myself with the chairman of the committee to report his bill to the House; but when the majority of the committee voted against reporting it the question before the committee was not disposed of and the committee was certainly not prepared to make any report at that time, and no report whatever should have been made at that time upon the subject. In the first place there were several bills upon the same subject before the committee, and when the vote was taken upon one bill and the result was unfavorable it did not dispose of the other bills before the committee. It was but just and right that the committee should take action upon the several bills before any report should be made to the House.

I do not think the chairman of the Committee on Commerce has ever intended to charge any wrong upon the majority of the committee who voted against him at that time. If so, I regret it; for certainly the action of the committee was in no manner improper, and was such that it can be defended here on the floor of this House or elsewhere.

[Here the hammer fell.]

Mr. FERNANDO WOOD rose.

The CHAIRMAN. Debate is exhausted.

Mr. WARNER. I withdraw my *pro forma* amendment.

Mr. FERNANDO WOOD. I renew the amendment of the gentleman from Ohio. Mr. Chairman, if I understand the purport and object of this amendment, it proposes to enable a majority of this House to discharge any committee from the further consideration of any bill after that bill has been before the committee for fifty days, and to bring the measure before the House for reference to the appropriate calendar, or for immediate passage. I have no doubt, Mr. Chairman, that the mover of this amendment and the gentlemen who favor it are actuated by a sincere desire to facilitate legislation, but I very much apprehend that if the amendment be adopted and the attempt be made to put it into practical execution, gentlemen will discover, when too late, that they have made a very serious mistake.

The chief defect in the proposition lies in its failure to make any distinction as to the character of measures referred to the various committees. There are committees of this House that may be in con-

stant session for five or six days in a week; and to such a committee may be referred a measure so important that it would be utterly impossible to do justice to it and present it to the House in proper and intelligible form within the time limited. Take, for instance, the Committee of Ways and Means, which has been in almost constant session from the 1st of December last, but has been unable to consider one-third of the bills referred to it by the House.

Mr. TOWNSHEND, of Illinois. Will the gentleman yield for a question?

Mr. FERNANDO WOOD. Certainly.

Mr. TOWNSHEND, of Illinois. In view of the statement of the gentleman, might it not be well to relieve the Committee of Ways and Means by dividing among several committees the work which now falls upon the Committee of Ways and Means alone?

Mr. FERNANDO WOOD. I am coming to that. The gentleman makes a very pertinent inquiry. The House refers to the Committee of Ways and Means measures which should go to other committees. One-third of the bills before us are private claims, so that every member of the committee is charged with considering, investigating, and reporting upon private claims, many of them involving important principles, which require a great deal of study and care for their proper disposition.

When these bills are before us we have either to ask the House to discharge us from further consideration of them or to report upon them at once. We have the funding bill, we have the tariff question, and we have very many important measures involving great detail, and we have patiently and laboriously to the best of our ability given all our time and all our energies to the consideration and elucidation of those questions. Now for the House to step in and in the midst of our consideration—and the same may be said of the Committee on the Judiciary or the Committee on Appropriations or the Committee on Commerce or any one of the other leading committees of the House—for the House, I say, to step in in the midst of our deliberation on those bills, when members have given the greatest care and attention for the purpose of understanding them, to take them from them and bring them before the House without discussion, without deliberation, without that proper investigation which all subjects ought to require, to take them, bring them before the House and act on them or send them to the "tomb of the Capulets" where they never can be heard of, is certainly not what this House intends to do. Under these circumstances, therefore, I hope the House will pause before it takes any such step as we propose by the adoption of the amendment moved by the gentleman from Tennessee.

Mr. McMAHON. Mr. Chairman, the country and the House cannot regret this discussion. All the time we spend on this point is well spent, for I concur in the motive which suggested the amendment of the gentleman from Tennessee, although I do not agree in the amendment itself. I hope this House will be impressed with the idea that to conceal or suppress a public measure simply and purely because a committee is not favorable to it will be regarded by every member of this House and every member of any future House as a crime against the House and the country itself.

But while we may bring the House to that judgment, the question occurs whether we are in a condition to adopt the rule the gentleman suggests, and I think if looked at from a practical stand-point it cannot be done. Why? The fundamental objection to all our legislation is this: The Congress of the United States continues in session for two years, and one is a long session and the other a short session. The result of that is necessarily in every Congress we begin legislation, but, like Sisyphus of old, when we have almost rolled the stone to the top of the hill the session comes to an end and it goes over to the next session, and, like Sisyphus, we have to begin the work again of rolling the stone up the hill, and so on. Until we can have a term of Congress for three years, to extend over three years, the Senate going out in six years and the House in three, having three long sessions, if it be desirable the Congress of the United States shall legislate, we can then legislate, but never can legislate before.

What have we to do? We have to apply the doctrine which holds in natural history, the doctrine of the survival of the fittest, and the fittest must come to the front and it cannot be helped. Who is to determine? Who had better determine? We are always supposed to be honest and upright men, to have no jobs—it is not a violent supposition although it may fail in particular cases—and that when these things go into committee they are considered, taken up, those of the greatest public importance first, and those of the least left to be taken up afterward. What is the result? Take the Judiciary Committee, of which I was a member in the last House. I can give you one public measure which cannot be considered by that committee in less than six months' time. There is before that committee now the question of the Geneva award, and I say they cannot in less than six months give it the consideration it ought to have. I do not say that is the most important bill before that committee, but suppose it was the most important. If that committee was considering that for fifty days, what is the result? When brought before the House it does not go to the head of the Calendar. The fifty days having expired, it comes into the House. In the mean time, unimportant measures, more for individual interest than for their constituents at large, have been brought into the House and put on the Calendar, and all that business precedes it and has first to be disposed of.

Mr. YOUNG, of Tennessee. I want to ask my friend from Ohio

whether he does not believe if the Committee on the Judiciary, for instance, were to come into the House after a bill had been considered, brought before the House and put on the Calendar, and ask to have that bill recommitted, this House would not in every instance grant the request of that committee. If the bill were of any importance could it pass the House over the opposition of the committee which had been considering it?

Mr. McMAHON. How is the Judiciary Committee to get the floor to move that a certain bill on the Calendar shall be recommitted?

Mr. TOWNSHEND, of Illinois. The Committee on the Judiciary has the privilege to report at any time.

Mr. McMAHON. Not at all; I beg your pardon. Oh, no; you must consider in regard to these rules which have been changed in the House of Representatives, have been adopted because this is a great and cumbersome body. You must adopt that rule which enables you to put before the country that which the committees of the House think most important; and yet I do not want my friend from Tennessee to understand for one moment I consider a committee of this House should have the power, at any time, simply because it does not favor a bill to suppress it. I think that is a crime against the House of Representatives. I am in favor of fair and due consideration, but I do not wish to see bills come before the House unless they have been considered by a committee and favorably reported.

Mr. HOUSE. In the eighth line of the amendment after the word "considered" I move to insert "without debate;" and I wish simply to say a word in addition to what I have already said on this subject. I have heard no objection urged against this measure by any gentleman who has spoken upon the question. I have heard nothing excepting what I may term the fancies of gentlemen.

In reply to the gentleman from Ohio and the objection which he has made to it, when he says that the Geneva award bill would occupy the committee more than fifty days for its consideration, I would simply say that is a question which no gentleman would be likely to make the motion to take from the committee—the motion that is required to be made by the amendment which I have suggested. And if any gentleman was to make the motion to discharge the committee from the consideration of such a measure as that, how many votes would he get here?

A MEMBER. Not a majority.

Mr. HOUSE. He could not get anybody.

Mr. ATKINS. Will my colleague allow me to ask him a question?

Mr. HOUSE. Certainly.

Mr. ATKINS. I wish to ask my colleague if he does not think the object which he has in view would be defeated by not applying his amendment exclusively to bills of a public character? It would be necessary to get rid of a great many unimportant bills which might be upon the Calendar before the important bills could be reached, and if my colleague would confine his rule to the great important questions that he refers to, for instance revenue matters, finance matters, and internal improvement matters, then perhaps he could effect the reform which he seeks, but by applying it to all public matters indiscriminately I think he defeats his object.

Mr. BLACKBURN. Now, unlike the gentleman from Ohio who has just addressed the committee, I do deprecate this discussion. I think I am in sympathy with a fair majority of this House when I enter a protest against consuming this whole day in passing over less than six lines of this report. I think the majority of this House is in full sympathy and accord with me when I enter a protest against consuming two months in the consideration of this report of the Committee on Rules.

Mr. ATKINS. I desire to say to the gentleman that this is the first minute of time that I have occupied during this discussion.

Mr. BLACKBURN. I do not apply my criticism to the gentleman from Tennessee at all; but I merely desire to say that unless we can have unanimous consent for immediate action upon the pending rule I shall move that the committee rise for the purpose of limiting debate to one minute.

The question recurred upon the amendment of Mr. HOUSE.

The House divided; and there was—ayes 61, noes 75.

Mr. HOUSE demanded tellers.

Tellers were ordered; and Mr. HOUSE and Mr. BROWNE were appointed.

The House again divided; and the tellers reported—ayes 65, noes 94. So the amendment was rejected.

The Clerk proceeded to read Rule XXIX.

Mr. THOMAS TURNER. Mr. Chairman, I desire to offer the following amendment, which is in substance the same as that which was offered by the gentleman from Tennessee which has just been disagreed to, with the exception that it refers exclusively to measures affecting commerce, revenue, finances, and internal improvements.

The CHAIRMAN. The committee has already passed from the consideration of the rule to which the gentleman now refers.

Mr. THOMAS TURNER. I attempted to get the floor for the purpose of offering this amendment, but the Clerk commenced to read the next rule. I tried to get the eye of the Chair for the purpose of offering this amendment.

The CHAIRMAN. Of course, if the gentleman states that he rose for that purpose the Chair will now recognize him. The Clerk will read the amendment offered by the gentleman from Kentucky.

The Clerk read as follows:

When a bill or proposition of a public nature affecting commerce, revenue, finance, or internal improvements has been referred to a standing committee of the House, and such committee shall fail for fifty days to make any report to the House thereon, it shall be in order on any Monday immediately after the expiration of the morning hour, to move to discharge the committee from the further consideration of the same; which motion shall then be considered without debate, and, if decided in the affirmative, the bill or resolution shall be placed on the proper calendar, unless a majority of the House shall then determine to consider the same.

The amendment was not agreed to.

The Clerk read as follows:

RULE XXIX.

CONFERENCE REPORTS.

The presentation of reports of committees of conference shall always be in order, except when the Journal is being read, while the roll is being called, or the House is dividing on any proposition.

Mr. WILLIAMS, of Wisconsin. I offer the following as an amendment to the rule which has just been read.

The Clerk read as follows:

And such reports, instead of referring by number to the amendments or propositions agreed to in conference, shall be so written out as to inform the House from the reading of the report what effect such amendments or propositions will have upon the measures to which they relate.

So that, if adopted, the rule will read as follows:

"The presentation of reports of committees of conference shall always be in order, except when the Journal is being read, while the roll is being called, or the House is dividing on any proposition; and such reports, instead of referring by number to the amendments or propositions agreed to in conference, shall be so written out as to inform the House from the reading of the report what effect such amendments or propositions will have upon the measures to which they relate."

Mr. BLACKBURN. Let me suggest to the gentleman from Wisconsin, speaking for myself, and I doubt not the Committee on Rules, that there is no objection to the proposed amendment except in this: it must of necessity be effected by incorporation into the joint rules of the two Houses. This House has no power by any action which it may propose to bind the conferees on the part of the Senate; so that, to accomplish the purpose which the gentleman's amendment seeks to reach, there must be a provision made in the joint rules between the two Houses that will bind the conferees of both. Of course the same conference report made to this House must be made to the Senate, and we cannot bind the Senate through its conferees to anything unless we do it by a general rule. I am in favor of the gentleman's proposition.

Mr. RANDALL, (the Speaker.) There is force in what the gentleman from Kentucky [Mr. BLACKBURN] states, that this ought to be provided for by a joint rule. But joint rules are not likely to be agreed upon. For myself I maintain, and always have maintained, they are still in force until the same power which made the joint rules should vacate them. But the Senate chooses not to subscribe to that view. This proposition in itself has great merit. There ought to be no conference report brought into this House for its consideration unless the House by the reading of it is thoroughly informed as to its effect upon the bill proposed to be passed. I myself would prefer to have the proposition go into these rules, even although it only went there with the force of a recommendation to our conferees on the part of the House, so that this provision shall be in the future binding, at least in a suggestive way, upon our conferees.

Mr. WILLIAMS, of Wisconsin. I am obliged to the honorable Speaker for making the very suggestion which I had risen a moment ago to make, namely, that this is a preliminary step, in which I have no doubt the House will be followed in its action by the Senate.

Mr. BLACKBURN. Will the gentleman from Wisconsin allow me to suggest an amendment which has been suggested to me by the remarks of the gentleman from Pennsylvania? A conference report must be a report of the two Houses, and must be identical in word and line and syllable. But if the gentleman by his amendment will simply require that the members of the conference on the part of the House shall append that statement to their conference report, I will support it.

Mr. WILLIAMS, of Wisconsin. I very gladly accept the suggestion of the gentleman from Kentucky.

The CHAIRMAN. What is the modification of the amendment suggested by the gentleman from Kentucky?

Mr. BLACKBURN. It is that the amendment be altered so as simply to require the House members of a committee of conference to append to their conference report a statement of the points covered by the numbers of the amendments which the conference report embraces.

Mr. CANNON, of Illinois. I hope it will not be said, "append to their report," but that the statement will be included in the report to the House. Then the House conferees, in obedience to the House rule, would not consent to a report until the information the rule requires is embodied in the regular conference report, the duplicates respectively for the House and for the Senate being the same.

Mr. BLACKBURN. We cannot coerce the Senate by a rule of this House.

Mr. CANNON, of Illinois. I am speaking of what would be the practical working of such a rule.

Mr. BLACKBURN. A conference report means the report of the

conference committee of the two Houses. The reports to the two Houses must be duplicates, the one of the other. There cannot be a syllable in the conference report made to this House that is not embraced in the report made to the Senate. We cannot compel the Senate to do what is here suggested; but I pledge myself I will use my best endeavor as a member of the Committee on Rules and of the Joint Committee on Rules to have this incorporated into a joint rule to govern the two Houses. While assenting to the idea of the gentleman from Wisconsin, I am in favor of so modifying his amendment as to require the House members of the committee of conference to furnish with each conference report an explanation, by a statement in detail of the points in controversy covered by such report.

Mr. KEIFER. I think it well we should understand this question. I am not entirely satisfied with the suggestion of the gentleman from Kentucky. I would be afraid that the House members of the committee of conference would undertake to report something in addition to the conference report, understanding they were required to do this by the new rule. That would be a very great anomaly.

The terms of the amendment offered by the gentleman from Wisconsin, as I understood by the reading, do not require the committee of conference to report *verbatim* the amendments to which their report refers, but requires them merely to state the substance, the effect, of what is proposed to be done by and through the conference report. Now, it is suggested by the gentleman from Kentucky that by adopting such a rule we would appear to be compelling or coercing the conferees on the part of the Senate. To a certain extent that is true. But I would like to inquire how it happens this very vicious system has grown up at the conference meetings between the two Houses; how the system has grown up of drawing conference reports in the way in which we have been in the habit of having them presented in the past.

I remember that we have had some of the most important things done here in the last two years by conference reports. The whole matter of post-office legislation was put into a report here on one occasion and passed in the Forty-fifth Congress, leaving out a great many things that had been passed upon and adopted in this House in committee. And that was passed through the House without half a dozen members outside of the committee of conference knowing what was in the report at all. There were merely certain numbers referred to.

Now I want to state, as there seems to be a great deal of unanimity about this, there can be no danger of adopting an amendment which would at least operate as a suggestion to the Senate. And they have no more right to say to us, "We shall have our conference reports drawn up merely by members as to the matters to be amended," than we have to insist that the substance of the report shall be stated.

Mr. HAYES. In view of what the gentleman from Kentucky [Mr. BLACKBURN] has said, that the two reports to the two Houses must be identical, I would ask the gentleman from Ohio, would this rule, if adopted, have any binding force on the joint committee of conference?

Mr. KEIFER. I understand the reports must be identical, and that is the reason why I do not want to modify this rule so as to require the House members of the committee to state something in addition to the report.

Mr. HAYES. The House members of the committee of conference could not live up to this rule in case it should be adopted.

Mr. BLACKBURN. Will the gentleman allow me to ask him a question?

Mr. KEIFER. Certainly.

Mr. BLACKBURN. I will say to the gentleman that I do not see anything inexplicable or difficult of comprehension in the suggestion I have made. Does not the gentleman know as well as he may know anything, that there is under general parliamentary law no power given to a committee of conference to inject anything into a conference report that is not already in dispute between the two Houses?

Mr. KEIFER. Let me answer the question by asking the gentleman if he does not know that in a conference report made to a former Congress a whole body of legislation, amounting to a long bill, amounting to pages of print, as it appeared afterward, in reference to postal matters, was introduced into a conference report, because there was a little dispute about some post-office matter? Does not the gentleman know that the whole matter of postage on different classes of mail matter was reorganized in a conference report, although up to that time we had not heard anything of it?

Mr. BLACKBURN. I do not know to what the gentleman refers, unless it be the Brazilian mail feature; if so, that was lost.

Mr. KEIFER. Yes, that was lost; it was adopted in the Senate and lost in the conference; but that is not what I refer to.

Mr. BLACKBURN. I have only this to say: the gentleman from Wisconsin [Mr. WILLIAMS] and myself understand each other. I am in favor of requiring the House members of every conference committee to accompany every conference report with an explanatory statement, showing exactly what points are covered by that report. I am in favor of putting that in the rules of the House, if the gentleman will consent to so modify his amendment.

Mr. WILLIAMS, of Wisconsin. Allow me to make a single suggestion. My amendment goes simply to the matter of form rather than to that of substance. It requires that the conference committee

shall use apt and proper words instead of numbers in their report. Now, can there be any doubt in the world that if we adopt a rule requiring the members of our committee of conference to adopt a certain form of report, the members of the conference committee on the part of the Senate will accept it? I am willing to accept any amendment which the gentleman may propose, if it will accomplish the purpose I have in view.

Mr. RANDALL, (the Speaker.) Then accept his modification.

Mr. WILLIAMS, of Wisconsin. I will accept it.

Mr. ATKINS. Allow me one question?

Mr. WILLIAMS, of Wisconsin. Certainly.

Mr. ATKINS. Does the gentleman design by his amendment that this statement or explanation of the various items in the conference report shall constitute a part of the report itself, or that it shall be a statement to simply accompany the report?

Mr. WILLIAMS, of Wisconsin. Simply a statement, independent of the report.

Mr. ATKINS. If it is to be a simple statement to accompany the conference report, I have no objection to it.

Mr. BLACKBURN. That is all.

Mr. DUNNELL. I ask that the amendment be read.

Mr. FRYE. Has the amendment been modified?

Mr. WILLIAMS, of Wisconsin. My design is to accept the modification suggested by the gentleman from Kentucky, [Mr. BLACKBURN,] if he will put it in form.

Mr. BLACKBURN. I will do so in one moment.

Mr. BRIGGS. A single word. It seems to me that this proposition, which commends itself to nearly every member of this House, was in a proper shape when submitted by the gentleman from Wisconsin, [Mr. WILLIAMS.] Let us see what will be the practical operation of it. A conference committee is appointed; that committee agrees upon matters of substance, and they also must agree upon matters of form. If the members of the House on that committee insist upon having the substance of their report fully explained in the report before they will assent to it, then you will have accomplished all that the gentleman desires. And that, I think, is reached by his original amendment.

Mr. BLACKBURN. I will furnish my modification to the Clerk in one moment. [After a pause.] I now send up to the Clerk the modification which I suggest.

The CHAIRMAN. The Clerk will read the amendment of the gentleman from Wisconsin [Mr. WILLIAMS] and the modification proposed by the gentleman from Kentucky, [Mr. BLACKBURN.]

The Clerk read the amendment of Mr. WILLIAMS, of Wisconsin, which was to add to Rule XXIX the following:

And such reports, instead of referring by number to the amendments or propositions agreed to in conference, shall be so written out as to inform the House from the reading of the report what effect such amendments or propositions will have upon the measures to which they relate.

The amendment of Mr. BLACKBURN was to substitute for the amendment of Mr. WILLIAMS, of Wisconsin, the following:

And there shall accompany every such report a detailed statement sufficiently explicit to inform the House what effect such amendments or propositions will have upon the measures to which they relate.

Mr. WILLIAMS, of Wisconsin. I will accept that in lieu of my amendment.

The question was taken upon the amendment as modified, and it was agreed to.

Mr. HOUSE. I offer as a separate rule that which I send up to the Clerk's desk. I do not want to debate it, and will simply state that it is identical with the proposition which I offered a few moments ago, except that I have modified it so as to relate alone to bills for raising revenue and reducing taxation.

The Clerk read as follows:

When a bill, resolution, or proposition relating to the raising of revenue or the reduction of taxation shall be referred to a standing or select committee of the House, and the committee shall fail for fifty days to make any report thereon, it shall be in order on any Monday, immediately after the expiration of the morning hour, to move to discharge the committee from the further consideration of the same, which motion shall then be considered without debate, and if decided in the affirmative the bill, resolution, or proposition shall be placed on the appropriate calendar, unless a majority of the House shall determine then to consider the same.

The question being taken on the amendment of Mr. HOUSE, it was not agreed to; there being—ayes 51, noes 65.

The Clerk read as follows:

RULE XXX.

SECRET SESSION.

Whenever confidential communications are received from the President of the United States, or whenever the Speaker or any member shall inform the House that he has communications which he believes ought to be kept secret for the present, the House shall be cleared of all persons except the members and officers thereof, and so continue during the reading of such communications, the debates and proceedings thereon, unless otherwise ordered by the House.

RULE XXXI.

READING OF PAPERS.

When the reading of a paper other than one upon which the House is called to give a final vote is demanded, and the same is objected to by any member, it shall be determined without debate by a vote of the House.

Mr. BOWMAN. I move to amend by inserting at the end of the rule last read the following:

Reports which have been printed shall not be read unless such reading shall be called for by vote of the House.

[Cries of "Vote!" "Vote!"]

I do not know whether the committee object to this amendment. I am sure I shall be pardoned if by taking a few minutes now I can save days or hours hereafter. It is within my limited observation that if there is any one thing which more than another (not even excepting "filibustering") uselessly consumes the time of this House, it is the reading of reports. We frequently see presented here the spectacle of a clerk going on for half an hour, three-quarters of an hour, or longer, reading voluminous reports while members are immersed in their newspapers or correspondence. No one ever dreams of listening to the reading of a report. A member, if he wants to be informed upon a subject, prefers to take in the substance of the report through his eyes rather than his ears; and he sends a page for the document.

In some of the State Legislatures we never think of having a report read; such a thing is unknown. The reading is utterly useless, or, if necessary in any case, my amendment proposes that it shall be subject to the control of a vote of the House.

Under our present practice when a proposition is made to dispense with the reading of a report a member jumps up and says, "I call for the reading of the report;" then all business must stop and nothing be done until the reading is concluded, not because the House wants to hear the reading, but because one single member demands it and no one cares to bring the question to a vote.

Mr. Chairman, we have been in session three months, and when a member of this House is asked, "What have you done?" he is obliged to pause and cannot give any answer. He cannot tell what business has been accomplished. It does seem to me—and I appeal to the Committee on Rules whether it is not true—that the reading of reports consumes uselessly more time in this House than any other thing.

Mr. RANDALL, (the Speaker.) I disagree with the gentleman from Massachusetts [Mr. BOWMAN] in his view that the reading of reports is of no particular use to the House. It seems to me the best possible way of getting information. While in many cases the great body of the House may not listen to reports, it is within my experience that there are always some members who do listen carefully, and thus are enabled in many instances to decide whether a bill should be passed or not.

Mr. BOWMAN. Let me ask why it is not safe to leave the House to say by vote whether it wants to hear reports or not?

Mr. RANDALL, (the Speaker.) Because every member who is called upon to vote on a measure recommended by a committee ought to have the privilege of knowing the reasons which influenced the committee in reaching the result they recommend.

Mr. BLACKBURN. The Committee on Rules have sought to reserve the right of every member in his individual capacity to demand the reading of any paper upon which he is called upon to give a vote. Apart from this the rules leave the question of the reading of papers to be determined by a vote of the House without debate. Whenever objection is made to the reading of a paper other than one on which a vote is to be taken, the House can determine by a vote of the majority and without debate whether the paper shall be read. I think that the amendment of the gentleman from Massachusetts would be, to say the least, mere surplusage.

The amendment of Mr. BOWMAN was not agreed to.

The Clerk read as follows:

RULE XXXII.

DRAWING OF SEATS.

1. The Clerk shall, at the commencement of each Congress, place in a box the name of each Member and Delegate of the House of Representatives, written upon a separate slip of paper, and, at an hour to be fixed by the House, shall proceed in its presence to draw from said box, one at a time, the said slips of paper, and as each is drawn shall announce the name of the Member or Delegate thereon, who shall thereupon choose his seat for the present Congress.

Mr. BLACKBURN. By the direction of the Committee on Rules I move to amend by striking out before the last word of this paragraph the words "the present" and inserting in lieu thereof the word "that;" so as to read: "for that Congress."

The amendment was agreed to.

Mr. REAGAN. I move to amend by inserting after the word "box," in line 2, clause 1 of Rule XXXII, the following:

Sufficiently large to admit of mixing the names; and after the names shall have been thoroughly mixed, the names of the members shall be put into the box separately, in alphabetical order, and.

I will explain the object of this amendment. If the box used for this purpose is small, as it generally is, and if the names be put in by States, I do not see how they can ever be mixed so as to comply with the spirit of the rule. My amendment proposes that the names be put in alphabetically instead of by States.

Mr. ATKINS. Does the gentleman propose that names beginning with A, B, and C, shall be in the bottom of the box?

Mr. REAGAN. It has been suggested to me to modify my amendment by inserting after the word "members" the word "delegates." I make that modification.

Mr. STEELE. I move to substitute for the first clause of the thirty-second rule what I send to the desk.

The CHAIRMAN. The proposition of the gentleman will be read

for information; but the vote must first be taken on the proposed amendment to the text.

The Clerk read as follows:

Strike out clause 1 of Rule XXXII, and insert:

At the commencement of each Congress the Clerk shall place in a box prepared for that purpose a number of small balls of marble or other material equal to the number of Members and Delegates, which balls shall be separately numbered and thoroughly intermingled, and at such hour as shall be fixed by the House for the purpose the Clerk shall, by the hands of a page, draw said balls one by one from the box, and announce the number as it is drawn, upon which announcement the Member or Delegate whose name on the numbered alphabetical list shall conform to the number of the ball shall advance and choose his seat for the term for which he is elected.

Mr. STEELE. Mr. Chairman, I have hitherto forbore engaging in the discussion of the rules to be adopted for the government of the House. My main reason for that perhaps, outside of my modesty, was that it was a subject totally incomprehensible to me, and I have never had any great ambition to figure in the CONGRESSIONAL RECORD upon matters I did not understand. [Laughter.] I do not say anybody else has not done the same. Now, it will be recollected by every member of this House that at the opening of the Forty-sixth Congress, when the names of members were called out to enable them to choose their seats, in one instance the names of five members from the same State were called consecutively, showing conclusively there could not have been a proper intermingling of the slips of paper placed in the box. Indeed, it is thoroughly impracticable to do it. And the only means by which a fair drawing of seats can take place is, according to my opinion, by the operation I have suggested. It is quite as simple, and secures absolute fairness in the selection of seats.

Mr. REAGAN. By consent of the House I will withdraw my amendment.

The CHAIRMAN. The question then recurs on the amendment of the gentleman from North Carolina as a substitute for the first clause of the rule as reported.

The amendment was adopted.

Mr. BLACKBURN. I give notice that in the House I shall demand the yeas and nays on that amendment moved by the gentleman from North Carolina, [Mr. STEELE.]

The Clerk read as follows:

2. Before said drawing shall commence, each seat shall be vacated and so remain until selected under this rule, and any seat having been selected shall be deemed forfeited if left unoccupied before the call of the roll is finished, and whenever the seats of Members and Delegates shall have been drawn, no proposition for a second drawing shall be in order during the same Congress.

Mr. BLACKBURN. I am instructed by the committee to move a verbal amendment:

In the last line strike out the words "the same" and insert "that;" so it will read: "during that Congress."

The amendment was adopted.

Mr. VALENTINE. There seems a considerable portion of the latter part of the clause just read, since the adoption of the substitute of the gentleman from North Carolina, is wholly unnecessary. I allude to that part about seats becoming vacant where the party leaves them.

Mr. FRYE. Oh, no!

The Clerk read as follows:

RULE XXXIII.

HALL OF THE HOUSE.

The Hall of the House shall be used only for the legislative business of the House, and for the caucus meetings of its members, except upon occasions where the House by resolution agree to take part in any ceremonies to be observed therein; and the Speaker shall not entertain a motion for the suspension of this rule.

Mr. CASWELL. I move to insert after the word "therein," in the fourth line, the following:

And the corridors and lobbies of the Capitol, so far as the House has control of the same, shall not be occupied by lunch-tables or parties offering for sale articles of merchandise other than newspapers and other printed matter usually kept for sale at news-stands.

[Cries of "Vote!"]

Mr. CASWELL. Very well, let there be a vote.

The committee divided; and there were—ayes 55, noes 60.

Mr. CASWELL demanded tellers.

Tellers were ordered; and Mr. MCGOWAN and Mr. BLACKBURN were appointed.

Mr. STEELE. Mr. Chairman, in this obscure corner of the Hall we do not hear anything that takes place at the Clerk's table, and I ask that the amendment be again read.

The CHAIRMAN. The Chair has made every effort to keep order in the Hall, but without effect.

The amendment was again read.

The committee again divided; and the tellers reported—ayes 37, noes 86.

So the amendment was rejected.

The Clerk read as follows:

RULE XXXIV.

OF ADMISSION TO THE FLOOR.

The persons hereinafter named, and none other, shall be admitted to the Hall of the House or rooms leading thereto, namely: The President of the United States

and his private secretary, judges of the Supreme Court, members of Congress and members-elect, the Secretary and Sergeant-at-Arms of the Senate, heads of Departments, foreign ministers, governors of States, the Architect of the Capitol, such persons as have, by name, received the thanks of Congress, ex-members of Congress who are not interested in any claim pending before Congress, and clerks of committees, when business from their committee is under consideration; and it shall not be in order for the Speaker to entertain a request for the suspension of this rule.

Mr. BLACKBURN. I am not directed by the committee, but I offer the following amendment, which I think will meet the approval of the House.

The Clerk read as follows:

Strike out in line 3 the following words, "of the United States and his private secretary," and insert in lieu thereof "and Vice-President of the United States and their private secretaries."

Mr. BLACKBURN. That admits to the floor of the House the Vice-President of the United States and his private secretary, which is simply a return for the courtesy extended to the private secretary of the presiding officer of this House.

Mr. BREWER. I move a substitute for that.

Mr. BLACKBURN. I hope my amendment will not be encumbered, but will be voted on by itself. There are a number to come in, I see.

Mr. BREWER. I move my substitute.

The CHAIRMAN. The substitute will be read, but will not be voted on until the text has been perfected.

The Clerk read as follows:

Insert after the word "Secretary," in line 3, the words "ex-Presidents and Vice-Presidents, Cabinet officers, Senators." Also insert after the word "Congress," in line 7, these words, "also ex-Vice-Presidents, ex-Senators."

Mr. BLACKBURN. I wish to call the gentleman's attention to the fact, of which he does not seem to be aware, that there is not an ex-member of this House to-day who is allowed to go upon the floor of the Senate Chamber. I have already taken occasion to call the attention of the gentlemen of the Committee on Rules to that fact as a want of reciprocity on the part of the Senate.

Mr. BREWER. I will strike out the word "ex-Senators."

Mr. BLACKBURN. I think it would be premature and hasty.

Mr. FRYE. Senators are covered by members of Congress, for Senators are members of Congress.

Mr. BLACKBURN. The Vice-President is not a member of Congress.

The CHAIRMAN. The first question is on the amendment of the gentleman from Kentucky.

Mr. WRIGHT. I want to say to the gentleman from Kentucky that an ex-President of the United States is excluded from the floor. While the President is in office he may come upon the floor, but after his term of office expires he is excluded by this rule.

Mr. BREWER. I offered my amendment as a substitute for the amendment of the gentleman from Kentucky, and not as a substitute for the whole section.

Now, I desire to make a suggestion. The proposition of the gentleman from Kentucky is entirely correct. There is no doubt about that. But it seems to me we should not only allow the Vice-President and President but ex-Presidents as well the privileges of the floor. The rule proposed by the committee does not allow that, or does not even allow Cabinet officers or Senators, except under the construction suggested by the gentleman from Maine. If that construction is correct, and it is understood that the term "ex-members of Congress" also includes ex-Senators, I do not wish to change that portion of it. But I think we ought to make it more explicit by including Cabinet officers and Senators.

Mr. HUTCHINS. I would like to ask the gentleman from Kentucky a question. Does the proposed amendment exclude members of the press from the room in the rear of the Speaker's seat?

Mr. BLACKBURN. No, sir; that is not contemplated in the rule.

The CHAIRMAN. Does the gentleman from Michigan desire to retain the word "Senators?"

Mr. BREWER. No; I am willing to strike that word out.

Mr. FRYE. Cabinet officers are necessarily heads of Departments.

The question recurred on the amendment of Mr. BREWER.

The committee divided; and there were—ayes 23, noes 73.

So the amendment was not agreed to.

The question next recurred on the amendment of Mr. BLACKBURN.

The amendment was agreed to.

Mr. TALBOTT. I propose to strike out all after the word "consideration" in the ninth line, and insert the amendment which I send to the Clerk's desk.

The Clerk read as follows:

And such persons as may be admitted by a resolution of the House upon the request of a member.

The amendment was not agreed to.

Mr. DUNNELL. I offer the following amendment.

The Clerk read as follows:

Add to the rule the following:
Or to present from the Chair the request of any member for a suspension of the rules.

Mr. DUNNELL. That is not now covered fully. The rule as it stands says "it shall not be in order for the Speaker to entertain a request for the suspension of this rule." Now, that rule is avoided

at the present time by having the request presented by the Speaker from the chair, and I want the rule to absolutely shut off the possibility of anybody getting upon the floor, excepting those admitted in express terms.

Mr. RANDALL, (the Speaker.) Say the Speaker shall not entertain a question by unanimous consent.

Mr. DUNNELL. That is covered by the amendment.

Mr. RANDALL, (the Speaker.) Let it be read.

The proposed amendment was again read by the Clerk.

Mr. RANDALL, (the Speaker.) Strike out "suspension of the rule" and insert "unanimous consent."

Mr. DUNNELL. I accept the amendment.

The question recurred upon the amendment of Mr. DUNNELL.

The committee divided; and there were—ayes 84, noes 21.

So the amendment was agreed to.

Mr. GEDDES. I present the following amendment to Rule XXXIV to be inserted in the sixth line after the word "Capitol."

The Clerk read as follows:

The Librarian of Congress and his assistants in charge of the law library.

Mr. RANDALL, (the Speaker.) I ask for a division of that question so that we can vote between the Librarian and his assistants.

The question was taken upon the first branch of the question, namely, "the Librarian of Congress."

The amendment was agreed to.

The question recurred on the second branch of the amendment, namely, "and his assistants in charge of the law library."

The amendment was agreed to.

Mr. BAKER. I offer an amendment to come in after the word "Departments," in line 5. It is simply for this purpose: The Commissioner of Indian Affairs, the Commissioner of Patents, the Commissioner of Pensions or any other bureau are absolutely needed here on the floor on the passage of appropriation bills.

Mr. RANDALL, (the Speaker.) I want to say but a word on this question. I think the Committee on Rules have gone far enough in this matter of admissions to the floor.

Mr. MCGOWAN. I rise to a point of order. No motion is before the committee.

The CHAIRMAN. The Clerk will read the amendment proposed by the gentleman from Indiana.

The Clerk read as follows:

In line 5, after the word Departments, insert the words "and of bureaus."

Mr. RANDALL, (the Speaker.) I hope that will not prevail. I think we have gone far enough. We have witnessed in our past experience the efforts of bureau officers to come in here and control Congress. I hope the amendment will not be adopted.

Mr. FRYE. I ask the attention of the chairman of the committee. It has been suggested to me that the Chief Clerk and the disbursing clerk of the House ought to be admitted. I leave the matter to the chairman of the committee.

Mr. BLACKBURN. Personally, I have no objection to such an amendment, but I have no authority to accept it.

Mr. FRYE. I will offer that amendment after the pending one is disposed of.

The question being taken on Mr. BAKER's amendment, it was not agreed to.

Mr. FRYE. I now offer the following amendment:

After the words "law library" insert "Chief Clerk and disbursing clerk of the House."

The question being taken on the amendment, there were—ayes 26, noes 62.

So (further count not being called for) the amendment was not agreed to.

Mr. WARNER. I offer the following amendment:

After the word "claim," in line 8, insert "or directly in any bill."

So that it will read:

Ex-members of Congress who are not interested in any claim or directly in any bill pending before Congress.

Mr. BLACKBURN. That is all right.

The amendment was agreed to.

Mr. ROBINSON. I offer the following amendment:

After the word "elect," in the fourth line, insert the following:
Contestants in election cases during the pendency of their cases in the House.

Mr. BLACKBURN. That is right.

The amendment was agreed to.

The Clerk resumed the reading of the report and read as follows:

RULE XXXV.

OF ADMISSION TO THE GALLERIES.

The Speaker shall set aside a portion of the west gallery for the use of the President of the United States, the members of his Cabinet, justices of the Supreme Court, foreign ministers and suites, and the members of their respective families, and shall also set aside a portion of the same gallery for the accommodation of persons to be admitted on the card of members. The southerly half of the east gallery shall be assigned exclusively for the use of the families of members of Congress, in which the Speaker shall control one bench, and on request of a member the Speaker shall issue a card of admission to his family, which shall include their visitors, and no other person shall be admitted to this section.

Mr. OSCAR TURNER. I offer the amendment which I send to the desk.

The Clerk read as follows:

Add to Rule XXXV the following:

And on the request of any member the Speaker may issue a card of admission to the family of said member to the new room adjoining the Hall of the House of Representatives and in the rear of the Speaker's seat.

Mr. OSCAR TURNER. I desire to say that when the families of members come here and take their seats in the galleries they frequently find the atmosphere very oppressive; and it would cause no inconvenience to allow their admission to this large and magnificent hall behind the Speaker's seat. I have offered the amendment at the request of the wives of many members; and I can see no impropriety in their having the privilege of going into the large room adjoining the Hall.

Mr. COX. I hope that will be adopted.

The question being put on Mr. OSCAR TURNER'S amendment, there were—ayes 48, noes 78.

So (further count not being called for) the amendment was not agreed to.

Mr. CONGER. I ask that that part of the rule which relates to the giving of cards for the admission of the families of members be again read.

The Clerk read as follows:

And on request of a member the Speaker shall issue a card of admission to his family, which shall include their visitors, and no other person shall be admitted to this section.

Mr. CONGER. Is it intended that for each day such a card shall be required?

Mr. BLACKBURN. It is not.

Mr. CONGER. It would be a very great inconvenience if we had to go every day and get such a card.

Mr. McMAHON. Get a season ticket.

Mr. RANDALL, (the Speaker.) It will last for a Congress.

Mr. DUNNELL. I offer the following amendment:

Strike out in line 2 the words "or rooms leading thereto."

Mr. BLACKBURN. I make the point of order that we have passed that rule.

Mr. DUNNELL. I think not.

Mr. BLACKBURN. The gentleman's amendment is to Rule XXXIV, and we have been considering Rule XXXV.

Mr. DUNNELL. I withdraw the amendment. [Laughter.]

The Clerk resumed the reading of the report, and read as follows:

RULE XXXVI.

OFFICIAL AND OTHER REPORTERS.

1. The appointment and removal, for cause, of the official reporters of the House, including stenographers of committees, and the manner of the execution of their duties, shall be vested in the Speaker.

2. Stenographers and reporters, other than the official reporters of the House, wishing to take down the debates and proceedings, may be admitted by the Speaker, to the reporters' gallery over the Speaker's chair, under such regulations as he may, from time to time, prescribe; and he may assign two seats on the floor to Associated Press reporters, and regulate the occupation of the same.

Mr. HUTCHINS. I ask the chairman of the committee what is the necessity of the word "down" in second clause of Rule XXXVI. Would it not be sufficient to say "wishing to take the debates and proceedings." Why must they be taken "down"?

Mr. RANDALL, (the Speaker.) I do not suppose any member is to be "taken down." [Laughter.]

The Clerk resumed the reading of the report and read as follows:

RULE XXXVII.

PAY OF WITNESSES.

The rule for paying witnesses summoned to appear before the House, or either of its committees, shall be as follows: For each day a witness shall attend, the sum of \$3; for each mile he shall travel in coming to or going from the place of examination, the sum of five cents each way; but nothing shall be paid for traveling when the witness has been summoned at the place of trial.

Mr. DUNNELL. I offer the following amendment:

In the third line of Rule XXXVII strike out "three" and insert "two," so that it will read:

"For each day a witness shall attend, the sum of \$2."

This House after long debate and deliberate discussion, declared that witnesses before the United States courts should be paid \$2 a day. In view of that fact, witnesses ought not to be paid \$3 a day here.

Mr. BLACKBURN. That is right.

The amendment was agreed to.

The Clerk read the following:

RULE XXXVIII.

PAPERS.

The clerks of the several committees of the House shall, within three days after the final adjournment of a Congress, deliver to the Clerk of the House all bills, joint resolutions, petitions, and other papers referred to the committee, together with all evidence or testimony taken by such committee, under the order of the House, during the said Congress.

Mr. FRYE. I desire the attention of the gentleman in charge of this report. I am informed that there are quite a number of committees whose clerks leave before the Congress ends, and that there are special committees whose clerks are discharged long before the close of Congress. In regard to them this rule would really be impracticable, and I suggest that it be amended so as to read as follows:

The Clerk of the House shall, within three days after the final adjournment of

a Congress, take into his keeping all bills, joint resolutions, petitions, and other papers referred to committees, together with all testimony taken by committees under the order of the House.

It seems to me that that is better than the rule which has been reported from the committee.

Mr. BLACKBURN. I am myself cognizant of the difficulty suggested by the gentleman from Maine, [Mr. FRYE,] and I think some provision should be made to remedy it.

Mr. RANDALL, (the Speaker.) Would it not be better to add that as an independent clause?

Mr. FRYE. I prefer it as a substitute for Rule XXXVIII.

Mr. HAWLEY. Then you should add to it that the Clerk of the House shall be charged with the duty of collecting such papers.

Mr. McMAHON. What would you do with those clerks who are annual clerks?

Mr. CLAFLIN. If the gentleman would add his amendment to the proposed rule I think he would accomplish his object.

Mr. FRYE. If gentlemen prefer it I have no objection to making it clause 2 of this rule.

Mr. RANDALL, (the Speaker.) I think it had better be added as an independent clause, rather than to interfere with the rule as reported.

Mr. FRYE. I will move it, then, as an additional clause.

The amendment of Mr. FRYE was agreed to.

The Clerk read the following:

RULE XXXIX.

WITHDRAWAL OF PAPERS.

No memorial or other paper presented to the House shall be withdrawn from its files without its leave, and if so withdrawn therefrom certified copies thereof shall be left in the office of the Clerk; but when an act may pass for the settlement of a claim the Clerk is authorized to transmit to the officer charged with the settlement thereof the papers on file in his office relating to such claim, or may loan temporarily to the officer or bureau of the Executive Departments any papers on file in his office relating to any matter pending before such officer or bureau, taking proper receipt therefor.

Mr. HAWLEY. I desire to call the attention of the gentleman from Kentucky [Mr. BLACKBURN] to the first part of the rule which has just been read. It reads:

No memorial or other paper presented to the House shall be withdrawn from its files without its leave, and if so withdrawn therefrom—

That is, withdrawn without its leave.

Mr. BLACKBURN. Strike out the word "so" before "withdrawn."

Mr. HAWLEY. Very well; that will do.

The amendment was agreed to.

The clerk resumed and concluded the reading of the report of the Committee on Rules, as follows:

RULE XL.

BALLOT.

In all other cases of ballot than for committees, a majority of the votes given shall be necessary to an election, and where there shall not be such a majority on the first ballot, the ballots shall be repeated until a majority be obtained; and in all balloting blanks shall be rejected and not taken into the count in enumeration of votes or reported by the tellers.

RULE XLI.

MESSAGES.

Messages received from the Senate and the President of the United States, giving notice of bills passed or approved, shall be entered in the Journal and published in the RECORD of that day's proceedings.

RULE XLII.

EXECUTIVE COMMUNICATIONS.

Estimates of appropriations, and all other communications from the Executive Departments, intended for the consideration of any committees of the House, shall be addressed to the Speaker and by him submitted to the House for reference.

RULE XLIII.

No person shall be an officer of the House, or continue in its employment, who shall be an agent for the prosecution of any claim against the Government, or be interested in such claim otherwise than as an original claimant; and it shall be the duty of the Committee of Accounts to inquire into and report to the House any violation of this rule.

RULE XLVI.

JEFFERSON'S MANUAL.

The rules of parliamentary practice comprised in Jefferson's Manual shall govern the House in all cases to which they are applicable, and in which they are not inconsistent with the standing rules and orders of the House, and joint rules of the Senate and House of Representatives.

RULE XLV.

These rules shall be the rules of the House of Representatives of the present and succeeding Congresses unless otherwise ordered.

Mr. REAGAN. I move to amend Rule XLV by adding that which I send to the Clerk's desk.

The Clerk read as follows:

Provided, That the adoption of these rules shall not be construed to interfere with special orders of this House heretofore made on pending bills.

Mr. COX. I would like to have that explained.

Mr. RANDALL, (the Speaker.) That ought to be the action of the House; it is hardly a matter to be incorporated in the rules.

Mr. BLACKBURN. I suggest to the gentleman from Texas [Mr. REAGAN] that these rules are yet to be adopted by the House. When

we go out of the Committee of the Whole and come into the House, that will be the time for the gentleman to move the proviso he now offers.

Mr. REAGAN. I would then labor under this difficulty: as soon as this is reported from the Committee of the Whole the previous question will be ordered upon it.

Mr. BLACKBURN. I will give the gentleman an opportunity to offer his amendment if it is deemed necessary.

Mr. RANDALL, (the Speaker.) It should be a resolution of the House, not a provision of a rule.

Mr. REAGAN. Very well, then; I will withdraw the amendment.

Mr. BLACKBURN. I move to amend Rule XLV by adding to it the following:

Provided, That Rule 85 (of the present rules) shall continue in force during the present Congress.

The new rules discontinue absolutely one of the committees of this House. Of course it is not proposed or intended to strike down that committee during the present Congress, but to leave it as appointed in full force and effect.

Mr. KEIFER. That had better be done by a resolution of the House.

Mr. BLACKBURN. I would as soon do it in that way as to have it incorporated in these rules; and I will therefore ask the Clerk to hold it, and I will not offer it at present.

Mr. GILLETTE. I offer as a substitute for Rule XLV that which I send to the Clerk's desk.

The Clerk read as follows:

These rules shall be the rules of the House of Representatives of the present Congress, and of succeeding Congresses only when adopted by them. And no Speaker shall be authorized to construct the committees of any future Congress without direct authority by vote of the House of Representatives.

Mr. GILLETTE. Mr. Chairman, we have some of us used our best efforts to amend these rules so as to protect the country at large from discriminations against individual members, from actual usurpation by a few of the powers and privileges of this whole House. Thus far those efforts have failed. While most of the rules presented are well enough and do not militate against the rights of individual members, a few are so bad, so antagonistic to every principle of justice and freedom that language too severe cannot be used in their condemnation. The most dangerous are those by which this House farms out to *one member* the right to appoint all the committees of this body, and then accords to those committees power to suppress any and all the bills referred to them.

Only yesterday it was charged that one member of the Committee on Commerce accused the Speaker of having packed the committee to kill a certain bill. I mention this only to show how naturally suspicions attach to the Speaker whenever measures considered important are suppressed by a committee, and not to reflect upon our Speaker.

During the consideration of these rules there have been ten amendments introduced to enable a majority of this House to demand a bill not reported by a committee after abundant time had passed for its consideration, but the leading members of both old parties have joined hands to protect the committees in any efforts to stifle the bills referred to them although desired by this House for their action.

These rules make an autocracy of this government, inasmuch as they give to the Speaker, who controls the floor of this House, the practical control of his appointees, the various committees, and make it impossible to get a solitary measure before the House unless by the favor of these committees. It makes no difference how worthy the Speaker may be. There is no man in the nation or in any nation to whom such powers over legislation should be granted. The United States Senate, a less republican body than this is supposed to be, is unwilling to trust even the Vice-President of the nation with such powers, but appoints its own committees and makes them directly accountable to the Senate.

The rules first adopted by this House were explicit, and prepared with the utmost care to protect the rights of the members, and provided that "committees consisting of more than three members shall be balloted for by the House." The important committees consisted of more than three members; for example, the one on elections had seven members.

As great an abomination as I believe these rules to be, as thoroughly anti-republican and anti-democratic as they are, practically subverting the representative feature of this Government, we might endure the injustice for this Congress, if compelled to, in the hope that our successors would indignantly throw off the yoke, but we are even asked to stretch this pall over them. We are asked, not only to yield our own rights, but also those of succeeding Congresses.

What right has one Congress to impose its laws upon a succeeding Congress? No more, in my judgment, than it has to impose them upon the English Parliament. It may be asked, then, what harm in passing a rule which can carry with it no authority. Every harm; for this implied authority will in the future, as in the past, be seized as a pretext on the part of the Speaker to appoint all his committees the moment he is elected, if indeed it is not done before he is elected, and these appointments used as a legal tender with which to purchase his election.

This Congress has never by vote authorized directly or indirectly

the Speaker to appoint a single standing committee. We have never even indorsed the appointments that have been made, and yet we have been divided out under authority of some preceding Congress. We have never even adopted one of the hundred and sixty-six rules that have been used like bits and bridles upon us from the hour we first met. If we must submit during this Congress let us do it with the hope that our successors may be more jealous of their rights and give to this House a republican government.

I believe these rules practically surrender the legislation of this country into the hands of one man, and give him more power than a dozen Presidents.

When Kossuth fled to this country for protection from Austrian despotism, he was welcomed to the Capitol by the greatest statesman of the time. In reply to Daniel Webster and others while comparing the Old World with the New, he said:

The Old is awful with unrestricted power; yours is glorious with having restricted it. At the view of the Old, nations tremble; at the view of yours, humanity hopes.

I repeat, the inevitable effect of these rules is to give the Speaker of this House almost unrestricted power. He may and will fill the few committees that control legislation with men who reflect his own views and wishes, and govern their action with undisputed sway, almost totally subverting the object of the annual gathering here of the so-called Representatives of the people.

When this Republic goes down, if go down it must, it will not be through the "man on horseback" or any President, but through the man on the *wool-sack* in this House, under these despotic rules, who can prevent the slightest interference from individual members; who can, if he will, make and unmake laws like an emperor, hold back or give the sinews of war and the salaries of peace.

The amendment of Mr. GILLETTE was not agreed to.

Mr. REAGAN. I move to amend by striking out, in Rule XLV, all after the words "House of Representatives;" so as to make the rule read:

These rules shall be the rules for the House of Representatives.

By the Constitution it is provided that—

Each House may determine the rules of its proceeding.

Contrary to this provision, we propose by the pending rule to declare that we are making rules for the government not only of the present but of future Houses of Representatives. This we can only do by laws enacted in conformity with the Constitution. The Constitution expressly reserves to each House the right to make its own rules; and if it be said that there must be some rules under which a new House shall organize, I answer that parliamentary law and parliamentary practice furnish such rules. I simply desire this House not to adopt a rule in violation of the Constitution; not to attempt to do that which it has not the power to do. [Cries of "Vote!" "Vote!"]

I do not wish to detain the committee, but only to call attention to the fact that by Rule XLV as it stands we are undertaking to do what we have no authority under the Constitution to do. Let us not undertake to deny the right of each succeeding House to adopt such rules as it may deem fit; let us not make ourselves ridiculous by proposing to bind in this way any future House of Representatives.

The question being taken on the amendment of Mr. REAGAN, it was not agreed to, there being—ayes 39, noes 63.

Mr. BLACKBURN. At the time Rule V was under consideration the committee on rules reserved the right to go back to it.

The CHAIRMAN. The Chair will state that the Committee on Rules also reserved the right, at the suggestion of the gentleman from Ohio, [Mr. GARFIELD,] not now present, to return to the third clause of Rule IV for the purpose of disposing of the matter of the execution of the bond of the Sergeant-at-Arms.

Mr. BLACKBURN. I ask that the Committee of the Whole may return to Rules XXIII and XXIV, so that I may offer some amendments which the Committee on Rules had unanimously agreed to, but which when these rules were under consideration were in the hands of the clerk of the committee, who was absent on that day.

Mr. FRYE. We can dispose of Rule IV in a moment, because in the absence of the gentleman from Ohio [Mr. GARFIELD] I feel at liberty to say that we came to the conclusion that if anything was to be done in relation to the Sergeant-at-Arms it must be done by law, not as a rule of the House.

The CHAIRMAN. But the gentleman from Indiana [Mr. NEW] has also an amendment pending to the third clause of Rule IV. His amendment was passed over with the other.

Mr. RANDALL, (the Speaker.) With reference to the amendment of the gentleman from Indiana, I will say that the committee took it into consideration and thought the features he proposed were very valuable and ought to be enacted into a law, as well as the suggestions of the gentleman from Ohio.

Mr. FRYE. But not into a rule.

Mr. NEW. I have no disposition to occupy the time of the committee by anything in addition to what I have heretofore said in support of my amendment. I will remark, however, that the gentleman from Ohio [Mr. GARFIELD] said to me a few days since that it was believed by the Committee on Rules to be best to have a statute upon this subject, but that it might be well, and probably would be best, to adopt the amendment which I had offered, inasmuch as it was uncertain when there would be such legislation. I am willing,

in the mean time, that the clause which I have offered to amend should remain as it is.

Mr. RANDALL, (the Speaker.) If the gentleman will introduce and have referred to the Committee on Rules a bill embracing his views, I have no doubt it will be promptly acted upon.

Mr. NEW. As it seems to be the sense of the committee that the amendment had better be withdrawn, I withdraw it.

Mr. RANDALL, (the Speaker.) The committee think that any provision on this subject had better be in the shape of a law.

The CHAIRMAN. The amendment of the gentleman from Indiana [Mr. NEW] being withdrawn, the Committee of the Whole will now return to Rule XXIII.

Mr. BLACKBURN. I am directed by the Committee on Rules to move to amend by adding to clause 1 of Rule XXIII the following:

Who shall, in case of disturbance or disorderly conduct in the galleries or lobby have power to cause the same to be cleared.

This relates to the power of the chairman of the Committee of the Whole. It is Rule 9 of the existing body of rules, and was accidentally omitted.

Mr. RANDALL, (the Speaker.) The amendment simply gives to the chairman of the Committee of the Whole the same power in this respect that the Speaker has in the House.

The amendment was agreed to.

Mr. BLACKBURN. I am directed by the Committee on Rules to move to amend by adding the following to the second clause of Rule XXIII, which relates to occasions when the Committee of the Whole finding itself without a quorum reports that fact to the House:

But if on such call a quorum shall appear, the committee shall thereupon resume its sitting without further order of the House.

That is the present rule exactly.

The amendment was adopted.

Mr. BLACKBURN. I now offer from the Committee on Rules a substitute for clause 4 of the twenty-third rule.

The Clerk read as follows:

In Committees of the Whole House, business on their calendars shall be taken up in regular order, excepting bills for raising revenue and general appropriation bills, which shall have precedence; and when objection is made to the consideration of any bill or proposition, the committee shall thereupon rise and report such objection to the House, which shall decide without debate whether such bill or proposition shall be considered or laid aside for the present; whereupon the committee shall resume its sitting without further order of the House.

Mr. BLACKBURN. We simply provide the machinery looked to in the fourth clause.

Mr. CONGER. Would that require in passing every bill each time when the bill was reached that the committee should rise?

Mr. BLACKBURN. Yes, sir; and that was insisted upon.

Mr. RANDALL, (the Speaker.) On your side.

Mr. CONGER. I know no sides in this matter.

Mr. RANDALL, (the Speaker.) I mean it was insisted on by the minority.

Mr. BLACKBURN. It is the present clause of the rule, and explains more elaborately, but conforms to the general order of business in that it gives priority to revenue bills and general appropriation bills.

Mr. REAGAN. Is it understood that the rule which permits the privilege to the Committee on Commerce on bills relating to rivers and harbors is unaffected by this amendment?

Mr. BLACKBURN. It is not affected in the slightest, as the river and harbor bill is not a general appropriation bill.

Mr. REAGAN. I move it shall embrace, then, the river and harbor appropriation bill, too.

Mr. COX. I should like to hear it read again if there be no objection.

The amendment was again read.

Mr. REAGAN. I move, after the word "appropriation," to insert the words "and bills for the improvement of rivers and harbors."

The amendment to the amendment was agreed to.

Mr. COX. I give notice that I shall demand the yeas and nays on that amendment when we get into the House.

The amendment, as amended, was then adopted.

Mr. BLACKBURN. I move, in the seventh clause of the twenty-third rule, to strike out the words "recommendation to strike out the enacting words" and insert in lieu thereof the following: "an adverse recommendation."

That simply means not to report a bill back from the Committee of the Whole by striking out the enacting words, but simply to report it back with adverse recommendation, which is broader and covers all adverse action in committee.

The amendment was adopted.

Mr. RANDALL, (the Speaker.) I am directed by the Committee on Rules to move an amendment, which is not a substantial change, but merely makes the language more harmonious. It is in the nature of a substitute for the first clause of Rule XXIV.

The Clerk read as follows:

Each Monday morning during a session of Congress, after the Journal of the proceedings of the last day's sitting has been read and approved, the Speaker shall call all the States and Territories in alphabetical order for bills and resolutions for reference, on which call joint and concurrent resolutions and memorials of State Legislatures may be presented and appropriately referred; and on this call only resolutions of inquiry directed to the heads of the Executive Departments shall be in order for reference to appropriate committees, which resolutions shall be reported to the House within one week thereafter.

Mr. BLACKBURN. And territorial Legislatures should be added. Mr. RANDALL, (the Speaker.) I will modify my substitute by inserting those words so as to read, "memorials of State and territorial Legislatures."

The CHAIRMAN. The clause as it now stands has been very materially amended in the Committee of the Whole, and, as the Chair understands, the amendment moved by the gentleman from Pennsylvania is a substitute for the clause as it now stands.

Mr. RANDALL, (the Speaker.) I move it as a substitute for the entire first clause as it has been amended.

The CHAIRMAN. The Clerk will read the clause as it now stands, having been amended in the Committee of the Whole.

The Clerk read as follows:

Each Monday morning during a session of Congress all the States and Territories shall be called in their alphabetical order for bills and joint resolutions and memorials of State and territorial Legislatures and House resolutions for reference; and on this call only resolutions of inquiry directed to the heads of the Executive Departments shall be in order to be submitted; and said resolutions shall lie upon the table, and the mover or proposer of such resolution shall be permitted to call up the same after the reading of the Journal, at any time after the expiration of one week, and have the same submitted to a vote of the House without debate.

Mr. RANDALL's substitute, as modified, was adopted.

Mr. RANDALL, (the Speaker.) I am directed by the Committee on Rules to move, in the fourth clause of the twenty-fourth rule, where the word "Monday" is used, to insert "the first and third Monday," so as to make it conform to the action of the committee recently taken.

The amendment was agreed to.

Mr. RANDALL, (the Speaker.) I am also directed, in clause 6 of the same rule, to strike out in the first paragraph after the word "Union" the words "to consider, first, bills raising revenue and general appropriation bills, and then other business on its calendar."

Mr. CONGER. What is the object of that?

Mr. RANDALL, (the Speaker.) In order that it may conform to the previous action of the committee. It is provided for in Rule XI, and is unnecessary here.

The amendment was agreed to.

Mr. BLACKBURN. I move now that the committee rise and report the rules as amended to the House.

Mr. CONGER. Before that motion is put, I desire to ask that either the Committee on Rules or the chairman of it shall cause a copy of the rules to be printed as they have been adopted by the Committee of the Whole in order that we may see what action has been taken upon them.

Mr. BLACKBURN. It is my purpose when we get into the House to ask that the rules as adopted by the Committee of the Whole shall be printed with all the amendments in italics and each one numbered. I will say further that up to this time the clerk of the committee has kept up with all the amendments, so that there will be no delay in preparing this copy for the printer. I now move the committee rise.

The motion was agreed to.

The committee accordingly rose; and the Speaker having resumed the chair, Mr. CARLISLE reported that the Committee of the Whole on the state of the Union had, according to order, had under consideration the report of the Committee on Rules, and had directed him to report the same back to the House, with sundry amendments thereto.

Mr. BLACKBURN. Mr. Speaker, I now give notice to the House that I shall ask to call up in the House for action, on Tuesday next, immediately after the morning hour, the revision of the rules as reported from the Committee of the Whole.

Mr. ATKINS. Why not to-morrow?

The SPEAKER. The Chair will say to the gentleman from Tennessee that the Committee on Rules would like to see the rules in print.

MARCH 2, 1880.

REVISION OF THE RULES.

Mr. BLACKBURN. I move that the morning hour for to-day be dispensed with, the object being to proceed with the consideration of the report of the Committee of the Whole House on the subject of the revision of the rules.

Mr. MORSE. I hope the gentleman will withhold that motion for a moment.

Mr. BLACKBURN. If I yield to one gentleman I must yield to twenty others.

The motion of Mr. BLACKBURN was agreed to, two-thirds voting in favor thereof.

Mr. BLACKBURN. I now move that the report made by the Committee of the Whole on the state of the Union upon the subject of the proposed revision of the rules be taken up for consideration.

Mr. CONGER. I move to amend so as to provide that each rule and each paragraph be read and acted upon separately.

The SPEAKER. It is the gentleman's right to have a vote on every amendment.

Mr. CONGER. But I desire that each rule shall be acted on separately.

The SPEAKER. Does the gentleman from Kentucky [Mr. BLACKBURN] agree to that?

Mr. BLACKBURN. I do not. On the contrary, unless it be desired that the report of the Committee of the Whole upon the revision be read, I shall ask to dispense with the reading of the report, except the amendments which have been agreed on in Committee of the Whole and such amendments as the Committee on Rules propose now to offer.

Mr. CONGER. Does not the gentleman propose to have these rules open to amendment by others than the Committee on Rules?

Mr. BLACKBURN. Most certainly not. I am going to ask the previous question at once as soon as we have submitted our amendments.

Mr. CONGER. I give notice now that unless there is an opportunity to offer one or two amendments which we on this side propose to submit, I shall endeavor (and I hope to succeed) to prevent the ordering of the previous question by any parliamentary means in our power.

Mr. WEAVER. And we will assist you.

Mr. CONGER. I demand, therefore, an opportunity to offer amendments to such of the rules as we desire to amend, outside of the Committee on Rules.

Mr. BLACKBURN. That is the gentleman's right, provided he has strength enough to vote down the demand for the previous question.

Mr. CONGER. We have strength enough to prevent action of the House at all, and I give that notice so the gentleman may understand we shall insist upon our right to offer amendments outside of the Committee on Rules.

Mr. BLACKBURN. I knew the gentleman would do that. I did not need any notice from him.

Mr. CONGER. I cannot see, in the interest of progress and good order, why the gentleman should not permit the amendments which we desire to be offered. [Cries of "Regular order!"]

Mr. YOUNG, of Tennessee. I desire to offer a suggestion.

Mr. BLACKBURN. I will hear the gentleman from Tennessee.

Mr. YOUNG, of Tennessee. I desire to have a yea-and-nay vote on an amendment.

The SPEAKER. That is the gentleman's right on any amendment reported from the Committee of the Whole House.

Mr. YOUNG, of Tennessee. But I desire to have a vote on an amendment which was not adopted in the committee.

The SPEAKER. If not adopted and reported from the Committee of the Whole on the state of the Union it is not before the House at all.

Mr. YOUNG, of Tennessee. I wish to ask the gentleman in charge of these rules a question.

Mr. CONGER. I desire to ask the gentleman from Kentucky to except from the operation of the previous question Rule XXI.

Mr. BLACKBURN. If the House will allow me, I will tell them exactly what has been agreed upon. The demand I propose to submit for the previous question upon the report from the Committee of the Whole on the state of the Union was the result of the unanimous action of the Committee on Rules this morning. As to Rule XXI it was amended by way of substitute in the Committee of the Whole House and it is the right of every member of this House to demand a yea-and-nay vote on that amendment to day in this House. That is the right of the gentleman from Michigan on my right, or of any other gentleman in the House.

Mr. CONGER. The gentleman need not waste words in telling me my rights on that; I understand what they are.

Mr. BLACKBURN. I know the gentleman from Michigan scarcely ever fails to exercise all his, and occasionally grabs for somebody else's rights. [Laughter.] But in this case Rule XXI is subject to the call of the yeas and nays, that is, on the amendment in the nature of a substitute adopted by the Committee of the Whole on the state of the Union. The unanimous action of the Committee on Rules is the warrant I hold for the motion I indicate to the House I am going to submit, which is to apply the previous question to this report. Two months' debate have already been had on it. Every opportunity has been offered to every member of this House during those two months in the Committee of the Whole House to amend every rule and every clause and every paragraph of every rule. Now we have reached the conclusion of the labors of the Committee of the Whole House, and in accordance with instructions given me unanimously by the Committee on Rules I intend to ask this House to apply the previous question to all the amendments reported from the Committee of the Whole House on the state of the Union.

Mr. HOUSE. Now, I know, Mr. Speaker, the gentleman from Kentucky will yield to me for one moment.

Mr. BLACKBURN. Certainly.

Mr. HOUSE. The amendment of Rule XXI, or any other amendment which has been put on the rules, can have a yea-and-nay vote in the House. I desire to ask the gentleman whether he will allow me to offer an amendment which was not adopted in committee, so we may have the yeas and nays upon it. I think there is a general disposition to call the previous question—there is on my part I know; I do not wish to go over all this ground again, but I do consider this as of vital importance, and I want gentlemen to go on the record upon it. I ask to have the amendment I suggest read for information.

Mr. BLACKBURN. Certainly.

Mr. HOUSE. I will send it to the Clerk's desk. I do not wish to

debate it, but simply to have a yea-and-nay vote upon it—to have the privilege of offering it as an amendment during the consideration of the rules and a vote upon it by yeas and nays.

The Clerk read as follows:

When a bill, resolution, or proposition relating to the raising of revenue or the reduction of taxes shall be referred to a standing or select committee of the House and the committee shall fail for fifty days to make any report to the House thereon, it shall be in order on any Monday, immediately after the expiration of the morning hour, to move to discharge the committee from the further consideration of the same; which motion shall then be considered without debate, and, if decided in the affirmative, the bill or resolution shall be placed on the appropriate calendar, unless a majority of the House shall then determine to consider the same.

Mr. HOUSE. Now, I ask the gentleman from Kentucky whether he will allow me to offer that, so we may have the yeas and nays upon it. I understand, sir, that the Committee of Ways and Means determined this morning to touch no legislation of that sort. I want to see whether the representatives of the people are ready and willing to surrender their interests in their hands. [Applause.]

Mr. BLACKBURN. I wish, Mr. Speaker, to answer the question submitted to me by the gentleman from Tennessee.

The SPEAKER. The gentleman from Kentucky is upon the floor.

Mr. BLACKBURN. I will now answer the question propounded to me by the gentleman from Michigan.

I will say to the gentleman from Tennessee that he remembers very well in Committee of the Whole by voice and by vote I supported the very identical amendment for which he now asks to reserve the right to offer, even without debate, in the House. I am as cordial in its favor as any man here, but I have no right to agree to any understanding of that kind. The Committee on Rules unanimously instructed me to apply the previous question if the House would so consent, and I must insist on that. Were it a matter personal to me I would gladly yield for that amendment and for that of the gentleman from Michigan or that of any other gentleman on the floor, provided it was coupled with the proposition which the gentleman from Tennessee makes, to vote on the amendment without debate. But I have no authority, no power, to do so. I simply stand here as the spokesman of the Committee on Rules, and ask the previous question by the unanimous order of that committee.

Mr. CONGER. I do not ask to debate the proposed amendment, but we upon this side of the House desire to have an opportunity to vote upon the question of riders upon appropriation bills by striking out in Rule XXI, in the third paragraph, all after the word "order." I say that without debate we want our record on that subject; and it is no more than fair to this side of the House and to the country that we should have an opportunity to do that. And, Mr. Chairman, we intend to have that right and that opportunity if we stand silent here for weeks. We have spent three months in extra session discussing that question of riders upon appropriation bills, and that much time has been wasted unless we now have an opportunity to make our record on the principle proposed to be embodied in that rule. I have already said that we do not wish debate; we only ask a vote on the proposition to strike out all after the word "order" from that Rule XXI, all of that portion of it which relates to riders upon appropriation bills. And if I understand the temper of this side of the House we intend to have a vote if by any parliamentary process we can obtain it.

Mr. BLACKBURN. All I can say is, the only way for the gentleman to reach that—

Mr. CONGER. In order that I may be understood let me read to the House that portion of paragraph 3 upon which I wish the opportunity of making a record. It is to strike out after the word "order," in the third paragraph of this Rule XXI, the following words:

Except such as, being germane to the subject-matter of the bill, shall retrench expenditures.

The remainder of that is an amendment which can be voted upon. I want a vote upon striking out that proposition, and if the Committee on Rules do not desire unanimously to grant the right to vote upon that proposition, I have misunderstood the sentiment of some of its members.

Mr. BLACKBURN. Then the gentleman from Michigan has misunderstood one of his colleagues.

Mr. CONGER. I would like some gentleman of the Committee on Rules on this side of the House to state if they have agreed that there shall be no yea-and-nay vote on this proposition to strike out.

Mr. BLACKBURN. Nobody has so said. On the contrary, I repeat the statement I made, which is this: that no member of the Committee on Rules objected to a yea-and-nay vote on anything; but that the Committee on Rules unanimously agreed in its session this morning to instruct me to ask the previous question and apply it to this report and to the amendments to be submitted by the Committee on Rules as well as to those reported from the Committee of the Whole House, and that action of the committee leaves me no margin for discretion. The gentleman has already had the opportunity over and over again to exercise his right to vote in the Committee of the Whole upon this very identical subject.

Mr. CONGER. But without a record.

Mr. BLACKBURN. Without a record, I grant, and there also stands the gentleman from Tennessee, who desires a record upon another very important amendment.

A MEMBER. Then let him have an opportunity of making a record.

Mr. BLACKBURN. Now there is but one way for the gentleman from Tennessee to reach his purpose, with which I sympathize, and for the gentleman from Michigan to reach his purpose, with which I do not sympathize, namely, to vote down the previous question and open up the discussion without limit in the House, and let us take two months more, probably as we have had already the last two taken up in the discussion of this report.

Mr. CONGER. I have already stated to the gentleman from Kentucky that I do not desire debate upon this proposed amendment.

Mr. BLACKBURN. I know very well the gentleman does not ask debate, but if this is done who will undertake to say that no man in this House will not ask to be heard? Who will undertake to assert on this floor every man will not have his pocket full of amendments to every rule in this series on every one of which some one will not ask to be heard?

Mr. CONGER. Will the gentleman permit me to ask some member of the Committee on Rules on this side of the House if they did assent that there should be no ye-a-and-nay vote on the proposition to strike out of that Rule XXI the clause providing for political riders on appropriation bills? I should like to know that.

Mr. FRYE rose.

Mr. TOWNSHEND, of Illinois. I rise to a question of order. It is that this debate is not in order.

The SPEAKER *pro tempore*, (Mr. COX.) The gentleman from Kentucky [Mr. BLACKBURN] has the floor.

Mr. TOWNSHEND, of Illinois. The gentleman from Kentucky has moved the previous question, as I understand.

Mr. BLACKBURN. I have not asked it as yet. I yield to the gentleman from Maine, [Mr. FRYE.]

Mr. FRYE. An inquiry has been made of me as a member of the Committee on Rules; and I say for myself that I did consent to the demand for the previous question, and so did every member of that committee. I say further that I am in favor of sustaining the demand for the previous question. I do not know for whom the gentleman from Michigan [Mr. CONGER] speaks when he speaks for this side. I only speak for myself. And I say to the gentlemen on this side that we have had our opportunity. To be sure we are not on record by a ye-a-and-nay vote; but the whole country knows that the democratic side of the House sustains the proposition for riders and that the republican side of the House sustains the proposition against riders. You cannot make it any plainer or any clearer if you spend two months more. I except on the democratic side some three or four gentlemen every one of whom is on record by a speech or an amendment.

Now, sir, as a republican, as a friend to the tariff, if you please, as an opponent to the cutting down of the internal-revenue taxes on tobacco and on whisky any further, I am in favor of the previous question being ordered, and am not in favor of opening up before this House all these great questions under this matter of the mere rules. And I say to the republican side of this House before you vote down the demand for the previous question, look carefully to see what doors you will open, what debates you will spring upon this House, what votes you will be compelled to take part in.

Mr. HOUSE. I understand the gentleman from Maine then to be in favor of a committee of this House smothering the voice of a majority of its members.

Mr. WEAVER. And also afraid to trust the members of this House.

Mr. FRYE. Smothering the voice of a majority of this House! Why, sir, the gentleman from Tennessee [Mr. HOUSE] by himself and others offered that amendment six different times and in different forms in Committee of the Whole and had a vote upon it every single time by tellers; and the amendments were voted down by a large majority notwithstanding that a member of the Committee on Rules was in favor of the proposition and speaking for it.

Mr. HOUSE. I want a record on it.

Mr. FRYE. Well, now, I simply point the gentlemen on my own side of the House to this exhibition of what may be likely to come before the House provided you vote down the previous question or filibuster against it. You have the gentleman from Iowa [Mr. WEAVER] leading his forces in certain directions and for certain purposes; you have the gentleman desiring to take off the duty on tobacco and whisky leading his forces. I ask you if it is safe to open the discussion anew, to open the rules anew to amendment and have two more solid months consumed of the time of this House and of this country in that way.

Mr. WEAVER and Mr. CONGER rose.

The SPEAKER *pro tempore*. The gentleman from Kentucky has the floor.

Mr. CONGER. I ask the gentleman to yield to me.

Mr. BLACKBURN. How much time?

Mr. CONGER. Five minutes.

Mr. BLACKBURN. Very well.

Mr. CONGER. Although the gentleman from Maine [Mr. FRYE] agrees with the committee in the demand for the previous question, and although he attempts to administer a rebuke to me and other members on this side of the House who desire a record on the political-rider question, which has agitated this country more than all other questions within the last year, I still thank him for his argument in so far as it may influence, if it be possible to make an argument which shall influence that side of the House, to vote down the previous question. The gentleman has made it stronger than I could do.

But, sir, I do say for myself—and I do not pretend to represent anybody else—I do say for myself that I will resist the passage of these rules without an opportunity of casting a ye-a-and-nay vote, and making a record upon all that transpired in the extra session, and now in this session, and in this committee, as far as I may be able if I stand alone in it. What is the argument of the gentleman? Does he surrender all that we worked for during these long months? Does he ignore all that shook the republican party throughout the Northern States to its very heart, and which influenced the republicans of the North more than any other series of questions or subjects in the last fall elections? Does he ignore all that? I do not; and I will strongly express the hope that there are other gentlemen whose constituents will not permit them to oppose the opportunity of having a ye-a-and-nay vote on the rule which permits vicious, dangerous, revolutionary, unpatriotic riders to be fastened upon appropriation bills.

Mr. WARNER. Was it not that side of the House which, when the test came, voted down the amendment? [Cries of "Order!" "Order!"] That side of the House voted it down. [Cries of "Order!"]

Mr. CONGER. This is not the first time that the gentleman from Ohio [Mr. WARNER] has endeavored to draw into his all-consuming mint the time of other gentlemen here, or to drown with his mellifluous voice the hoarse utterances of an humble member from Michigan.

Mr. WARNER. I am sorry indeed if I have drowned the voice of the gentleman from Michigan [Mr. CONGER] which is so seldom heard here. [Laughter.]

Mr. CONGER. If the craze of the last session is returning, if it is coming again upon the gentleman from Ohio, in God's name I will stop. There are no worse things in this House than that, except political riders. [Laughter.]

Mr. BLACKBURN. I think we have had enough—

Mr. HOUSE. I ask the gentleman to yield to me for a moment.

Mr. BLACKBURN. Very well.

Mr. HOUSE. I wish the gentleman to understand that what I desire is a vote on my proposition without one word of debate. There shall be no debate upon it, so far as I am concerned and so far as I can control it, and I think I can pledge that there will be no debate on it. It is a proposition that is understood by all.

Mr. BLACKBURN. I know that.

Mr. GARFIELD. Will the gentleman yield to me for a few minutes?

Mr. BLACKBURN. Certainly.

Mr. GARFIELD. I think it is a valuable trait in any man's judgment of affairs to be able to know when he is beaten, to know when to fight, and when to see and acknowledge that with all the forces in his hands he is defeated.

On this side of the House we have made a very persistent and very earnest, and I think, an exceedingly fair exhibition of our desire to prevent by positive enactment in the rules the presence of political riders on appropriation bills. We had re-enforcements from some of the noblest and best elements on the other side of the House, [laughter,] and for a time it appeared probable that we were going to succeed. But what happened? All the power of party discipline was brought to bear upon our allies, and they were told that the point of party honor would not permit the rule in question to be changed, even if they should resolve privately that in fact and in practice there should be no political riders upon appropriation bills during this session. And as I understand it, though I have no authority for making the assertion, but I express it as my belief that this was the truce which brought about our formal defeat; that it was probably agreed that there should be no attempt this session to put political riders on appropriation bills if they would only let the rule remain unchanged, so that they might have the appearance of victory to cover the reality of defeat.

Now, that is my understanding of the situation. We have won a moral victory against political riders, and I am not afraid that political riders will again disfigure the appropriation bills during this session.

Mr. PAGE. They will next session.

Mr. GARFIELD. Even if the attempt were made this session, it would be voted down by a part of their own forces. Now, the question in my mind is this: shall we fight any longer for a mere point of honor, on which the other side has the power to beat us with a record or without a record? The device of my friend from Ohio [Mr. WARNER] was a contrivance which could be revolved around like the little fifteen-block puzzle, only to be brought again to the same insoluble position. That was simply a part of the general tactics. The gentleman succeeded in expressing his opinions in a qualified way against political riders, and then his block was revolved around until at last he voted against the whole modification of the rule. Now, my friend from the Marietta district can never take any glory to himself for his share of the final outcome.

Viewing these things, therefore, as I do, we are brought face to face with this problem; shall we now reopen the whole fight on the rules, only to come out of the end of another indefinitely long struggle at possibly the same place? While we are doing that, trying to adjust our blocks in the puzzle, the other party will be adjusting their blocks, the tariff blocks, the center party blocks, all their wooden blocks, or iron blocks, or brass blocks, or paper blocks, all revolving around in the puzzle to come out at the end in a general tangle upon the whole board. Shall we do that?

I am unwilling to start off now in filibustering to bring about our

object some way or other, to get some one on the record, when, in my judgment, the record is as well made up in the history of the country as it could be with five hundred yea-and-nay votes. Every member of the democratic party in this House, except those who spoke and are therefore on the record with us, has voted at every turn and at every place against any amelioration of the rule in reference to riders. Their record is as well made up as though they had painted it on the sky every morning in black letters.

Now, therefore, never believing in shooting that which is dead already, never believing in continuing a fight merely for the sake of fight, believing that we have won the moral victory already and the reality of victory also, and that both parties have been sufficiently put on the record before the country, and desiring to get what good there is in these rules, I concur in the recommendation of the Committee on Rules, and believe that we ought not to open this question any further, but should come to an immediate vote on the pending amendments.

Mr. BLACKBURN. Now, Mr. Speaker, I think the exhibition we have had here this morning demonstrates as clearly as anything could do the absolute necessity of applying the previous question, if we ever expect to put an end to debate otherwise interminable and come to final action on these rules. I do not feel it incumbent upon me to follow the gentleman from Ohio [Mr. GARFIELD] into that portion of the field into which he has gone, prefacing what he had to say by a declaration of irresponsibility. It would hardly be proper or fair for me to strike at the gentleman from Ohio or his statements, when he has already advised the House and the country that he is not responsible for those statements, does not know them to be true, and has no authority for making them. Still going on with his qualifications, he adds that in his opinion some sort of a secret bargain in the nature of a truce was struck by which no political legislation was during this session to be put upon appropriation bills. I am not responsible for the gentleman's conclusions or opinions or suspicions. I simply desire to say that I have no information, and I never heard even a suspicion thrown out, that any such truce has ever been effected or any such agreement ever made, proposed, or dreamed of. Nor do I believe that there was ever such a proposition made by one member of this House to any other member; nor do we stand committed in any wise upon that question.

The gentleman is a member of the Committee on Rules, and, by way of justice to all the members of that committee, I may state, what the gentleman already knows, that this morning the substitute known as the Morrison substitute, adopted in Committee of the Whole House for the third clause of the twenty-first rule, was brought up in the Committee on Rules. I violate none of the secrets of the committee (because the right was there reserved to state the facts on the floor to-day) in saying now that when that substitute was brought up in the Committee on Rules this morning a majority of the committee declared against it, and a minority, consisting of the Speaker of the House and myself, voted for it. There is the record. The right was reserved to make it a public record, and I make it public now. The gentleman from Maine, [Mr. FRYE,] the gentleman from Ohio, [Mr. GARFIELD,] and the gentleman from Georgia [Mr. STEPHENS] all voted this morning in the Committee on Rules against the substitute adopted by the Committee of the Whole on motion of the gentleman from Illinois, [Mr. MORRISON.] Those gentlemen declared their preference for the original rule as it now stands.

Mr. FRYE. Will the gentleman from Kentucky allow me a remark right here?

Mr. BLACKBURN. Certainly.

Mr. FRYE. The three members of the committee indicated by the gentleman preferred the rule as it stands because they believed that the Morrison amendment only extended it and offered an invitation and a temptation to every committee in this House to conceive of and propose riders for appropriation bills.

Mr. BLACKBURN. Of course, Mr. Speaker, those gentlemen had reasons satisfactory to themselves; and the gentleman from Maine doubtless states their reasons correctly. I simply stated the fact.

It is not possible for us to reopen this question without throwing the door wide open to a multitude of amendments and to illimitable debate. I can therefore only do as I have been instructed by the Committee on Rules to do—ask that the reading of the report from the Committee of the Whole House (which means the whole proposed revision of the rules) be dispensed with, unless there be objection; and if there be objection I ask now that the Clerk begin to read that report.

Mr. WARNER. I ask the gentleman to allow me two minutes to reply to the personal allusions of my colleague, [Mr. GARFIELD.] [Cries of "No!" "No!"]

Mr. BLACKBURN. Mr. Speaker, I protest that I would be glad to yield to the gentleman from Ohio, [Mr. WARNER,] and he knows it; but there are a dozen gentleman sitting around me who would make similar requests.

Mr. WARNER. They have not been made the object of attack by any gentleman on the other side of the House.

Mr. BLACKBURN. I yield two minutes to the gentleman from Ohio, with the distinct understanding that I do not yield the floor for any further debate.

Mr. WARNER. Then, Mr. Speaker, I wish to say in reply to my colleague that the "moral victory" he boasts of is nothing more than

a tactical blunder into which he himself led or helped to lead his party. Respecting the amendment which I offered, my colleague, as the RECORD will show, said in Committee of the Whole that if I would change two words in it he would accept it and that the other side would accept it. Those words were changed in accordance with that suggestion, and my colleague did then vote for it, and I believe in good faith, but the next day he came upon the floor and voted against it.

Mr. GARFIELD. No, sir; I did not vote against it; I voted for it.

Mr. WARNER. Well, if he did not vote against it he did not vote for it, although he was in the House when the vote was called. Finally, when the amendment was offered in a different form, expressing exactly what I believed to be the position of the democratic party on that question, preventing "riders" upon appropriation bills that would cut off appropriations for legitimate objects, but at the same time allowing amendments that should reduce expenditures or withhold appropriations altogether from specific objects—in which position I understood many gentlemen on the other side of the House concurred—when that amendment came up, that side of the House having by its vote once adopted it, defeated it. They dug their own pit and fell into it, and my colleague has not succeeded this morning in extricating them from it.

[Here the hammer fell.]

Mr. GARFIELD. Of course if it embodied the opinion of the democratic party we would vote against it.

Mr. PAGE. Mr. Speaker, I rise to a parliamentary inquiry. The SPEAKER *pro tempore*. The gentleman will state it.

Mr. PAGE. If the demand for the previous question be voted down will the amendment offered by my friend from Michigan be in order to the third clause of the twenty-first rule?

The SPEAKER *pro tempore*. Undoubtedly.

Mr. CARLISLE. And I ask whether in that case all other amendments which gentlemen may seek to propose will not also be in order?

The SPEAKER *pro tempore*. All will be in order.

Mr. BLACKBURN. And I wish to ask another question, and it is this: Will not all other amendments which any member may see proper to offer be in order, and will not debate be unlimited on every one of them?

The SPEAKER *pro tempore*. Every member will be entitled to an hour if he gets the floor. [Laughter.]

Mr. ROBESON. I rise to a parliamentary inquiry.

The SPEAKER *pro tempore*. The gentleman will state it.

Mr. ROBESON. Will it not be competent for the gentleman having charge of these rules to reserve the right on a single amendment, that amendment being merely one expressive of the opinion of this side of the House on the question of political riders—

Mr. BLACKBURN. Let me ask the gentleman from New Jersey—

Mr. ROBESON. Would it not be competent for him to reserve that amendment?

Mr. RANDALL, (the Speaker.) That requires unanimous consent.

Mr. ROBESON. And to say that he will insist on it, that is, on the demand for the previous question, reserving only that one amendment?

Mr. RANDALL, (the Speaker.) That amendment was rejected by the committee, and is not before the House.

Mr. ROBESON. I ask the Chair whether it is not competent for the gentleman from Kentucky to reserve the right to put in that one amendment?

Mr. BLACKBURN. The gentleman seems fonder of asking questions than having them answered. I say to the gentleman from New Jersey that it is not competent, for it requires unanimous consent.

Mr. ROBESON. I ask the Chair—

The SPEAKER *pro tempore*. The Chair would state that the rules of the House limit the operation of the previous question. The Chair does not propose to answer any more inquiries on that subject.

Mr. ROBESON. I ask whether the gentleman refuses to do that?

Mr. RANDALL, (the Speaker.) He cannot do it.

Mr. BLACKBURN. It is not in the power of any man to do it.

I now ask that the Clerk shall report by their numbers, *seriatim*, the amendments proposed by the Committee of the Whole House on the state of the Union, and the amendments submitted by the Committee on Rules, upon all of which I will demand the previous question.

Mr. ROBESON. I rise to a parliamentary inquiry. Is it not competent for the gentleman to demand the previous question on all the rules except Rule XXI?

Mr. BLACKBURN. I answer the same question in the same words again, and hope the gentleman from New Jersey will understand it, that it is not within my power, nor is it within his, nor is it in the power of every man on this floor save one, if that one objects.

Mr. TOWNSHEND, of Illinois. It requires unanimous consent.

Mr. BLACKBURN. Yes, it requires unanimous consent. Now, we understand what the operation of the previous question would be.

Mr. ROBESON. Do I understand the gentleman to say—[Cries of "Order!"] Pardon me, one word. Do I understand the gentleman to say he can demand the previous question on all the rules except Rule XXI?

Mr. BLACKBURN. Of course the gentleman does not understand me to say so, but he does understand me to say that as long as there

is a single objection made on this floor the purpose he seeks to reach and the vote he wants to get cannot be had.

Mr. CONGER. That cannot be so.

Mr. BLACKBURN. Then I leave that point unsettled and will not have further debate. I now ask the previous question on every amendment reported from the Committee of the Whole on the state of the Union and every amendment offered by the Committee on Rules, a list of which the Clerk holds in his hands, and we are to understand that if this demand for the previous question be voted down, then the Committee on Rules have lost control of the revision of the rules, and it passes to the hands of the other side.

Mr. CONGER. As it ought to.

The SPEAKER *pro tempore*. The Chair will state the question. The gentleman from Kentucky demands the previous question on the amendments reported by the Committee of the Whole on the state of the Union and the amendments moved by the Committee on Rules, and then calls for the previous question.

Mr. CONGER. The amendments proposed by the committee must be read before the previous question can be asked. I demand that.

The SPEAKER *pro tempore*. The gentleman from Michigan is right.

Mr. CONGER. I understand some new rules have been offered, and we ought to hear them.

The SPEAKER *pro tempore*. The amendments will be reported.

Mr. BLACKBURN. Does the Chair rule the amendments must be read before the previous question is seconded?

The SPEAKER *pro tempore*. The amendments offered by the Committee on Rules cannot be pending unless they are read.

Mr. BLACKBURN. I have demanded the previous question on all the amendments.

The Clerk proceeded to read the amendments reported from the Committee of the Whole on the state of the Union.

Mr. CONGER. Mr. Speaker, I do not ask for the reading of all the amendments reported from the Committee of the Whole on the state of the Union, but only for the reading of those proposed to be offered in the House by the Committee on Rules.

Mr. BLACKBURN. The Speaker has already decided that the amendments must all be read.

The SPEAKER *pro tempore*. The Chair has made no such decision, but only that the amendments offered by the Committee on Rules to the report of the Committee of the Whole House on the state of the Union are not before the House until read at the Clerk's desk.

Mr. BLACKBURN. Very well; let us have all the amendments read, as that seems to be the object of the gentleman from Michigan.

Mr. CONGER. No; if they are read it is at the gentleman's request.

The Clerk proceeded to read the amendments *in extenso*. When the Clerk reached the amendments from the Committee on Rules,

Mr. CONGER rose and said: I make the point of order, Mr. Speaker, that the Committee on Rules have not the right to move amendments. They have no business to propose to this House any amendment to the rules whatever. They have not the bill, and have no right to make any change in it.

Mr. BLACKBURN. I propose to ask the Chair, in ruling on the point of order made by the gentleman from Michigan, whether it is not competent for me to propose, under the instructions of the Committee on Rules, while in charge of this measure, in the nature of a bill, before applying the previous question, to offer any amendment the committee may want to make to these rules?

Mr. CONGER. The point I make is this: The Committee on Rules have not the bill before them. The House has the bill in its own possession, and has not referred it back to the Committee on Rules for any purpose whatever. The House has the amendments presented by the Committee of the Whole, and the gentleman has no right now to propose amendments in the House.

Mr. BLACKBURN. Mr. Speaker, the amendments which the Clerk is about to read come from the Committee on Rules. As long as that committee has in charge this measure, and until it sees fit to ask and the House sees fit to apply the previous question, I take it to be a plain proposition it is competent for them to offer any amendments they please.

The SPEAKER *pro tempore*. The Chair overrules the point of order.

Mr. CONGER. I ask the Chair whether the Committee of the Whole House, the largest committee, having acted upon this bill and having reported it to the House, and the bill not having been sent to any other committee whatever, by what right this Committee on the Rules more than any other now has the right to offer amendments?

Mr. BLACKBURN. By the right of the custody of the bill and by the custody of the floor.

The SPEAKER *pro tempore*. The Chair overrules the point of order made by the gentleman from Michigan. The chairman of the Committee of the Whole House would not have the right to take the charge of the bill or any pending amendment. The Chair recognizes the right of the majority of the Committee on Rules to report this bill and offer amendments before the previous question is called.

Mr. HAWLEY. Is the motion for the previous question pending?

Mr. BLACKBURN. Yes; but it has not been seconded.

The Clerk proceeded with the reading till he reached the third clause of Rule XXI.

Mr. CONGER. Mr. Speaker, the Clerk has read the first clause of

paragraph 3 of this rule as if it was proposed to be stricken out. I do not understand that to be the action of the Committee of the Whole.

Mr. RANDALL, (the Speaker.) The gentleman will find that first part of this paragraph printed in italics below.

Mr. CONGER. Is it proposed to strike out the first part?

Mr. CARLISLE. The amendment proposed by the gentleman from Illinois [Mr. MORRISON] to the third clause of Rule XXI as a substitute for that clause contains the entire clause, although the first part of the amendment was identical with the rule as reported by the Committee on Rules.

Mr. CONGER. The mistake is that there are two copies of the rules printed, one of which repeats this first clause in italics and one omits it. I happen to have one of the copies which has omitted it altogether. Now, I desire to have read the amendments to this rule reported by the committee exactly as they are.

Mr. RANDALL, (the Speaker.) The Committee on Rules make no amendments to the report of the Committee of the Whole on the state of the Union.

Mr. BLACKBURN. I will state to the gentleman from Michigan that the Committee on Rules offer no amendment whatever to the third clause of the twenty-first rule as agreed upon in the Committee of the Whole. I have already stated this morning that the committee divided, two of its members being in favor of the amendment of the gentleman from Illinois, while three of them opposed it, and it is reported here precisely as it came from the Committee of the Whole House.

Mr. CONGER. Why did not the majority of the Committee on Rules report to the House an amendment if they were opposed to this amendment of the gentleman from Illinois?

Mr. RANDALL, (the Speaker.) They did not want to amend it.

Mr. BLACKBURN. The gentleman from Michigan is now inquiring of a thing which it would be more appropriate for a member of the majority of the committee to answer. The gentleman from Pennsylvania and myself constituted the minority in favor of the amendment of the gentleman from Illinois which has been read here.

Mr. STEPHENS. I want to say one word in reply to the gentleman from Michigan. As a member of the Committee on Rules I understood the report was to be that the majority of the Committee on Rules was against concurring in the amendment made by the Committee of the Whole. We were opposed to that, preferring to let the rule stand just as it was originally reported by the Committee on Rules. As one I agree with the gentleman from Michigan. I am opposed to all political riders and would vote with him to strike out the latter part of the clause of Rule XXI as reported by the Committee on Rules. But can we who thus think be benefited by rejecting the report of the committee? Suppose we vote them down, will not the House be in the same condition in which it is now? Shall we lose all the good of this revision, which I think is a great deal, simply because we cannot get all we want on the twenty-first rule? I say no.

Suppose we vote down the previous question, and vote down all the work of the committee; are we any better off? Shall we gain anything? No. Hence, while I am opposed to riders, yet as I see no opportunity or probability whatever of getting any change in that respect, I am for taking the rules just as the Committee on Rules left them in order to secure all the other good there may be in the revision.

Mr. CONGER. I have not yet got an answer to the question I asked, or the parliamentary inquiry, why, if a majority of the Committee on Rules were opposed to riders, they did not propose an amendment here.

Mr. BLACKBURN. Is that a parliamentary inquiry?

The SPEAKER *pro tempore*. The Chair can only take notice of the amendments proposed here by the committee. The question of the gentleman from Michigan is not a parliamentary inquiry.

Mr. CONGER. When we are acting upon amendments proposed by that committee, I think it is a parliamentary inquiry why the committee do not propose an amendment against riders on appropriation bills if the majority of the committee be opposed to such riders.

Mr. BLACKBURN. I do not think that is a parliamentary inquiry and I reckon it is a question which the Chair is not able to answer.

The SPEAKER *pro tempore*. The Chair cannot answer the question. The Clerk read amendment No. 39 reported by the Committee of the Whole, as follows:

39. Upon all bills or resolutions appropriating money or creating a charge or debt upon the people, the yeas and nays shall be taken on the final passage of such bills, in the House, and entered on the Journal.

And an amendment thereto proposed by the Committee on Rules:

Strike out after the word "all" the words "bills or resolutions appropriating money or creating a charge or debt upon the people," and insert "general appropriation and revenue bills and bills for the improvement of rivers and harbors."

Mr. GARFIELD. I ask that by unanimous consent the word "final" be stricken out. There is no other passage of the bill than its final passage. The use of the word is mere surplusage. The passage of the bill is its passage.

The SPEAKER *pro tempore*. The Chair hears no objection to that correction being made. The word "final" will be stricken out.

The Clerk read the amendments reported by the Committee of the Whole, numbered 40 to 55.

Mr. GARFIELD. There is a misprint in Rule XXVII which I ask

unanimous consent to have corrected. The words "which remained undetermined" should be inserted after the word "and," in the middle of the third line. They have been transposed by the printer. I ask the Clerk to make the correction, so that it will read:

After six days from the commencement of a second or subsequent session of any Congress, all bills, resolutions, and reports, which originated in the House and which remained undetermined at the close of the next preceding session, shall be in order for action, &c.

There being no objection, the correction was made.

Mr. BLACKBURN. Would it not be as well at the same time to strike out the word "next" and insert the word "last?"

Mr. GARFIELD. I think so.

There being no objection, the amendment was made.

The Clerk read the amendments reported by the Committee of the Whole, numbered 59 to 63. No. 63 was read, as follows:

Strike out clause 1 of Rule XXXII and insert as a substitute therefor the following:

"63. At the commencement of each Congress the Clerk shall place in a box prepared for that purpose a number of small balls of marble or other material equal to the number of Members and Delegates, which balls shall be separately numbered and thoroughly intermingled, and at such hour as shall be fixed by the House for that purpose, by the hands of a page, draw said balls one by one from the box and announce the number as it is drawn, upon which announcement the Member or Delegate whose name on the numbered alphabetical list shall correspond with the number on the ball shall advance and choose his seat for the term for which he is elected."

To which the Committee on Rules proposed the following amendment:

After the word "Congress," in the first line of the amendment, insert the words "immediately after the Members and Delegates are sworn in." And after the word "on," in the latter part of the amendment, strike out the word "the" and insert the word "a."

Mr. BLACKBURN. The latter amendment to the amendment is necessary, because there has been no provision made for the alphabetical list up to this time.

Mr. CONGER. I suggest as a further amendment to strike out the word "separately" and insert the word "consecutively."

The SPEAKER *pro tempore*. If there be no objection, that amendment will be made.

There was no objection.

The Clerk read the amendments reported by the Committee of the Whole numbered 64 to 69.

The sixty-ninth amendment was to add to Rule XXXIV, relating to admissions to the floor, the following:

Or to present from the chair the request of any member for unanimous consent.

So that it would read:

And it shall not be in order for the Speaker to entertain a request for the suspension of this rule, or to present from the chair the request of any member for unanimous consent.

Which the Committee on Rules proposed to amend by striking out the words "or to" and inserting the word "nor."

Amendment numbered 70 was read, as follows:

In Rule XXXVII strike out "three" and insert "two;" so that it will read: "For each day a witness shall attend, the sum of \$2," &c.

Mr. WHITE. Would the committee accept an amendment to provide that witnesses shall be paid for each day they are in actual attendance?

The SPEAKER *pro tempore*. The House can do that by unanimous consent. The amendment suggested by the gentleman from Pennsylvania [Mr. WHITE] will be read.

The Clerk read as follows:

Strike out of Rule XXXVII all after the words "as follows" and insert:

For each day a witness shall be in actual attendance in obedience to a regular subpoena the sum of \$2, and five cents for each mile he shall travel in coming to or going from the place of examination; but nothing shall be paid for traveling when the witness has been summoned at the place of trial, and *per diem* compensation only for the time such witness shall be in actual attendance at the place of hearing.

Mr. BLACKBURN. That can be done only by unanimous consent. I have no objection to it myself.

Mr. WHITE. Then I ask unanimous consent.

The SPEAKER *pro tempore*. Is there objection to the amendment suggested by the gentleman from Pennsylvania, [Mr. WHITE?]

Mr. KEIFER. Does it prevent witnesses from receiving *per diem* compensation while coming to and going from the place of examination?

Mr. WHITE. It does not alter the rule in that respect; it only prevents the payment of witnesses who never appear.

Mr. KEIFER. I ask that the amendment be read again.

The amendment was again read.

Mr. KEIFER. If the gentleman from Pennsylvania [Mr. WHITE] will modify his amendment in one or two particulars, I would be very glad to see it adopted. The word "summoned" should not be in the amendment; a witness is always subpoenaed. And it should appear in the amendment that the witness shall receive a *per diem* compensation for the time he occupies in going to and returning from the place of examination.

Mr. WHITE. That is all right. This amendment does not interfere with the rule as it is at present. "For each day the witness shall attend;" that has received a construction which allows the witness to be paid from the time he starts to go to the place of examination.

Mr. KEIFER. This proposed rule goes further and indicates a limit.

Mr. BROWNE. To save all trouble I object to the amendment.

Mr. WHITE. All right.

The SPEAKER *pro tempore*. The amendment being objected to it is not before the House.

The seventy-first amendment was to add to Rule XXXVIII the following:

2. The Clerk of the House shall, within three days after the final adjournment of a Congress, take into his keeping all bills, joint resolutions, and other papers referred to committees, together with all evidence or testimony taken by committees under the order of the House.

The Committee on Rules recommended the following as a substitute for the entire rule:

The clerks of the several committees of the House shall, within three days after the final adjournment of a Congress, deliver to the Clerk of the House all bills, joint resolutions, petitions, and other papers referred to the committee, together with all evidence or testimony taken by such committee, under the order of the House, during the said Congress and not reported to the House; and in the event of the failure or neglect of any clerk of a committee to comply with this rule, the Clerk of the House shall, within three days thereafter, take into his keeping all such papers and testimony.

The Committee on Rules also recommended an amendment to Rule XXXIX; in the clause "and if so withdrawn therefrom" strike out the word "so."

The SPEAKER *pro tempore*. All the amendments reported from the Committee of the Whole or recommended by the Committee on Rules have been read by the Clerk.

Mr. WARNER. I suggest that there are two or three places where there needs to be a change in the number of the noun or the verb, and a few places where the punctuation should be changed. I ask unanimous consent that before these rules shall be printed the Committee on Rules may make such corrections as they may deem necessary, not to change in the least the meaning or the sense of any rule.

It is said that the Emperor Sigismund, when corrected in the use of a Latin pronoun, replied that he was emperor and above grammar; nevertheless his declaration did not make his use of the word correct or change the Latin grammar. If the majority of this House should vote that we were above grammar it would hardly change the use of the language. I think the rules are cast in excellent English, clear and terse, but I would like to have these little corrections made.

The SPEAKER *pro tempore*. The gentleman from Ohio proposes that the Committee on Rules shall be empowered to make verbal corrections.

Mr. RANDALL, (the Speaker.) That is a dangerous power, which I think should not be given.

The SPEAKER *pro tempore*. Objection is made.

Mr. GARFIELD. I ask unanimous consent that the gentleman from Wisconsin [Mr. DEUSTER] be permitted to make a personal statement. I understand that he considers that I have done him injustice in a remark which I made this morning. For my sake, that I may be set right if I have wronged him, I ask that he be allowed to make a statement.

Mr. BLACKBURN. I have no objection.

Mr. DEUSTER. I was out of my seat for a moment this morning, and I understand that while I was absent the distinguished gentleman from Ohio [Mr. GARFIELD] stated that all the members on the democratic side of the House who were opposed to riders on appropriation bills either spoke or offered an amendment during the discussion of the rules. I desire to say that I was opposed to riders and voted for all amendments to strike out that clause of the rule; but I neither offered any amendment nor spoke on the subject. And I will further say that I am proud of that vote.

Mr. DUNNELL. How was the matter left just now in giving power to the Committee on Rules to make verbal amendments?

Mr. RANDALL, (the Speaker.) That was objected to.

Mr. DUNNELL. I am very glad of it.

Mr. WARNER. Then I ask unanimous consent to have some verbal changes made.

The SPEAKER *pro tempore*. The gentleman will state them.

Mr. WARNER. In Rule VIII, the fourteenth amendment reads "provided pairs shall be announced but once during the same legislative day." The word "that" should be inserted after the word "provided." In the third clause of Rule X is this language: "unless the committee, by a majority of their number, elect a chairman." The word "their" should be changed to "its." The word "its" is properly used in other places when standing for the noun committee.

Mr. BLACKBURN. That is all right.

Mr. WARNER. In clause 45 of Rule XI it reads: "all proposed legislation or order touching printing," &c. That should be "orders." It is evidently a misprint.

Mr. BLACKBURN. That is evidently a misprint.

Mr. WARNER. In the second clause of Rule XV is this language: "including the Speaker, if there is any." It should read, "if there be any," because the subjunctive is used. And there are two or three other places where the word "be" should be substituted for the word "is." I think the Committee on Rules should be allowed to make such changes as those I have indicated.

The SPEAKER *pro tempore*. If there be no objection the corrections suggested by the gentleman from Ohio [Mr. WARNER] will be made.

There was no objection.

Mr. CONGER. I ask the gentleman from Kentucky to admit an amendment in paragraph 7 of Rule XI, to insert after the word "commerce," where it first occurs, the words "life-saving service and light-houses;" so as to read "commerce, life-saving service, and light-houses." These subjects now go to that committee as an adjunct of commerce; but I think the language should be made specific.

Mr. FRYE. That is right.

Mr. BLACKBURN. Oh, no. I must object unless the gentleman adds "other than appropriations."

Mr. CONGER. I assent to that modification.

Mr. BLACKBURN. Then I have no objection.

Mr. CONGER. I modify my amendment so as to insert after the word "commerce" these words: "life-saving service and light-houses other than appropriations for life-saving service and light-houses."

Mr. BLACKBURN. That is right.

There being no objection, the amendment was agreed to.

Mr. DUNNELL. I wish to inquire whether near the close of Rule XXXIV, on page 17, the word "or" has been struck out and "nor" substituted?

Mr. BLACKBURN. The words "or to" were struck out and the word "nor" substituted, so that the clause now reads:

It shall not be in order for the Speaker to entertain a request for the suspension of this rule, nor present from the chair the request of any member for unanimous consent.

Mr. FRYE. That is right.

Mr. BLACKBURN. The striking out of the two words makes it, I think, unobjectionable.

Mr. DUNNELL. I question the propriety of the change. I do not think the sentence is made any clearer by it.

Mr. RANDALL. There are two propositions. The first is that the Speaker shall not entertain a motion to suspend the rules for this purpose; the second is that he shall not even allow a request to be made for unanimous consent.

Mr. FRYE. I rather guess that we were wrong in dropping out the word "to;" I think it would be best to retain it. It is my fault that "to" was taken out; and on looking at the matter again, I think that word should be retained.

Mr. DUNNELL. The word "or" is proper, instead of "nor."

Mr. ROBINSON. I think it makes no difference whether "to" is inserted or not, because if omitted it will certainly be understood. But it seems to me right to insert "or" instead of "nor," because the sentence begins with a negative. You say it shall not be in order to do a certain thing, namely, to entertain a motion. Then by inserting "nor" in the latter part of the sentence you have a double negative, which is equivalent to an affirmative.

Mr. FRYE. I guess the gentleman from Massachusetts [Mr. ROBINSON] is right. I back clear down. [Laughter.]

Mr. ROBINSON. I think "or" is clearly right.

Mr. BLACKBURN. Very well; let the language stand as printed in the report.

Mr. HAWLEY. Will the gentleman from Kentucky allow me to call his attention to another verbal correction?

Mr. BLACKBURN. Certainly.

Mr. HAWLEY. Clause 5 of Rule XXIV, on page 14, reads now in this form:

Unfinished business having been disposed of, it shall be in order to entertain a motion that the House do now proceed to dispose of the business on the Speaker's table, which, prevailing, the Speaker shall dispose of in the following order:

The words "the motion" should be inserted before "prevailing."

Mr. BLACKBURN. I think that is right.

Mr. HAWLEY. It will then read:

Which, the motion prevailing, the Speaker shall dispose of in the following order:

The SPEAKER *pro tempore*. The Chair hears no objection to this verbal amendment.

Mr. BLACKBURN. I now demand the previous question on all the amendments.

Mr. RANDALL, (the Speaker.) And on the report.

Mr. BLACKBURN. On all the amendments and on the report of the Committee of the Whole House.

The SPEAKER *pro tempore*. The gentleman from Kentucky demands the previous question on all the amendments and on the report.

The previous question was seconded.

Mr. GARFIELD. It is understood that a separate vote, whenever called for, may be had on any amendment?

Mr. BLACKBURN. Certainly.

The main question was ordered.

Mr. RANDALL (the Speaker) moved to reconsider the vote by which the main question was ordered; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. GARFIELD. In order to save time I suggest that any gentleman who desires a separate vote on any amendment indicate that amendment now, and that all the rest of the amendments be adopted in bulk.

Mr. BLACKBURN. If the gentleman from Ohio will permit, I suggest what will be a still further saving of time. I have prepared a list of amendments on which I am sure no gentleman wants a vote—immaterial amendments, embracing about half or more than half of all the amendments. Upon those we may vote without delay or sep-

arate vote or division. When that is done we will have left all of the amendments upon which any gentleman may want a separate vote and I think we can take a separate vote even to the extent of yeas and nays.

The SPEAKER *pro tempore*. The gentleman from Kentucky proposes certain amendments by number on which he thinks no separate vote will be demanded. The Chair would like to understand whether it is the wish of the gentleman from Kentucky to take the vote on these amendments which he has named in gross.

Mr. BLACKBURN. Yes, sir; I propose to take the vote on the amendments, the numbers of which will be read by the Clerk, in gross, and then the remaining amendments can be taken up and voted on separately.

The SPEAKER *pro tempore*. The Clerk will now read the amendments by number upon which it is proposed to take a vote in gross. The Clerk read as follows:

Amendments 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 19, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 40, 41, 42, 43, 44—

Mr. ROBESON rose.

Mr. BLACKBURN. Let any be stricken off from this list to which any gentleman shall object.

Mr. ROBESON. I desire to have a vote on amendment numbered 3.

Mr. BLACKBURN. Very well; let that be stricken off the list.

Mr. ROBESON. It is the amendment which gives the Clerk the power of proceeding by force of these rules in another Congress—

Mr. RANDALL, (the Speaker.) That is the law now.

Mr. ROBESON. I know of no such law.

The SPEAKER *pro tempore*. It will be stricken off the list and a separate vote will be had on Rule III. The Clerk will proceed with the reading of the numbers of the amendments which are to be voted on in gross.

The Clerk concluded the reading, as follows:

45, 46, 47, 48, 49, 50, 51, 52, 53, 55, 56, 57, 58, 59, 61, 62, 64, 65, 66, 67, 68, and 70.

Mr. OSCAR TURNER. I desire to inquire of the gentleman whether amendment 39 was embraced in that list?

Mr. RANDALL, (the Speaker.) It was not embraced, and there is an amendment pending to it. It is one of those which were amended by the Committee of the Whole House.

The SPEAKER *pro tempore*. And of course it is not included in this list.

Mr. RANDALL, (the Speaker.) Of course not, as a separate vote must be had upon it.

Mr. BLACKBURN. The amendments named I ask now shall be considered in gross.

The SPEAKER *pro tempore*. The Chair hears no objection.

The amendments were adopted.

Mr. BLACKBURN moved to reconsider the vote by which the amendments were adopted; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The SPEAKER *pro tempore*. The clerk will now proceed to read the amendments, in their order, on which separate votes have been asked. He will read, in the first place, the amendment to Rule III. The Clerk read as follows:

Strike out these words:

(3) [1. The Clerk shall, pending the election of a Speaker or Speaker *pro tempore*, preserve order and decorum, and decide all questions of order, subject to appeal by any member.]

And in lieu thereof insert the following:

1. The Clerk shall, at the commencement of the first session of each Congress call the members to order, proceed to call the roll of members by States in alphabetical order, and, pending the election of a Speaker, or of a Speaker *pro tempore*, preserve order and decorum, and decide all questions of order, subject to appeal by any member.

Mr. ROBESON. My objection to that amendment—

The SPEAKER *pro tempore*. Debate is not in order.

Mr. ROBESON. I should like to see what law regulates that.

Mr. RANDALL, (the Speaker.) It is nothing but the enforcement of the law.

Mr. ROBESON. I beg pardon, there is no law—

Mr. TOWNSHEND, of Illinois. I demand the regular order.

Mr. ROBESON. There is no law authorizing the Clerk of this House to preside over the next House of Representatives.

Mr. BURROWS. If there is any such law, we do not need this rule.

Mr. BLACKBURN. If we are going to debate it, let us have the hour rule.

Mr. CONGER. The amendment in what is proposed to be stricken out should be first voted on. There is an amendment in italics.

The SPEAKER *pro tempore*. What amendment is there in italics in the words proposed to be stricken out?

Mr. CONGER. Why, the words *pro tempore*.

Mr. WARNER. That is not an amendment. It is a Latin term which is usually put in italics.

The SPEAKER *pro tempore*. The motion is on striking out the words which have been read by the Clerk, and in lieu thereof inserting the words which have also been read by the Clerk.

Mr. CONGER. Let us have a division on that.

The House divided; and there were—ayes 129, noes 106.

Mr. CONGER. I demand the yeas and nays.

Mr. ROBESON. Is a parliamentary question in order pending that vote?

The SPEAKER *pro tempore*. The Chair will hear the gentleman. Mr. ROBESON. I desire to ask what effect this rule, if carried, would have when the next Congress comes together, if any gentleman chose—

The SPEAKER *pro tempore*. That is not a parliamentary question. Mr. ROBESON. I wish to ask what would be the effect if any gentleman chose to rise and propose a member of the next House should preside over it, whether it would be out of order under these rules?

Mr. RANDALL, (the Speaker.) Let us answer that.

Mr. ROBESON. I ask the Speaker.

Mr. CARLISLE. This is the law now.

Mr. RANDALL, (the Speaker.) Have the law read.

Mr. ROBESON. Very well; let the law be read.

The SPEAKER *pro tempore*. The point is in the nature of argument and debate.

Mr. ROBESON. I ask whether the effect sought to be produced by the rule would be to bind the next House by these rules?

Mr. BLACKBURN. I make the point of order this debate is out of order.

The SPEAKER *pro tempore*. We have nothing to do with the effect of the law.

Mr. BLACKBURN. I rise to a point of order. The gentleman from New Jersey has no right to rise to submit any question but a parliamentary question, and this is not a parliamentary question.

Mr. ROBESON. It is not a parliamentary question to ask what the effect of a rule will be?

The SPEAKER *pro tempore*. The Chair has decided that he cannot undertake to state the effect of this rule on a future Congress.

Mr. CONGER. Can anybody else?

The SPEAKER *pro tempore*. No one can tell.

Mr. ROBESON. If there is a law covering this case— [Cries of "Vote!" "Vote!"]

Mr. RANDALL, (the Speaker.) Yes, there is a law; and it was made by your own side.

Mr. ROBESON. I do not care by what side; there is no such law. The yeas and nays were ordered.

The question was taken; and it was decided in the affirmative—yeas 144, nays 101, not voting 47; as follows:

YEAS—144.

Claflin,	Hunton,	Richardson, D. P.	Wood, Walter A.
Clark, Alvah A.	James,	Simonton,	

So the amendment was agreed to.

During the roll-call the following announcements were made: Mr. BLOUNT. On this question I am paired with Mr. REED, of

Maine.

Mr. TAYLOR. I am paired with Mr. BRIGHAM, of New Jersey.

Mr. SINGLETON, of Illinois. I am paired with Mr. MILES, of Connecticut. If he were present, I should vote "ay."

Mr. DIBRELL. My colleague, Mr. SIMONTON, is paired with Mr. MCCOID, of Iowa. If Mr. SIMONTON were present, he would vote "ay."

Mr. BEALE. I am paired with my colleague, Mr. JORGENSEN.

Mr. KING. My colleague, Mr. ELAM, who is absent, sick, is paired with Mr. DICK, of Pennsylvania; and Mr. GIBSON, who is also absent from the House on account of illness, is paired with Mr. WAIT, of Connecticut.

Mr. VAN AERNAM. I am paired with Mr. CHALMERS.

Mr. CHITTENDEN. I am paired with Mr. BUCKNER.

Mr. STONE. Mr. MONEY is absent by reason of illness. He is paired with Mr. STARIN.

Mr. EINSTEIN. I am paired with Mr. CLARK, of New Jersey.

Mr. HARMER. Mr. FORT, of Illinois, is paired with Mr. O'BRIEN, of New York.

Mr. CALKINS. Mr. BELFORD is paired with Mr. SPRINGER.

On motion of Mr. BURROWS, by unanimous consent, the reading of the names was dispensed with.

The result of the vote was then announced as above recorded.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was agreed to; and also moved that the motion to reconsider be laid on the table.

The latter motion was then agreed to.

The Clerk read as follows:

After the word "Commerce," where it first occurs in clause 7, of Rule XI, it is proposed to insert "And the Committee on Commerce shall have the same privileges in reporting bills making appropriations for the improvement of rivers and harbors as is accorded to the Committee on Appropriations in reporting general appropriation bills;" so that, if amended, the clause will read as follows:

"7. To Commerce: Life-Saving Service and light-houses other than appropriations for Life-Saving Service and light-houses to the Committee on Commerce. And the Committee on Commerce shall have the same privileges in reporting bills making appropriations for the improvement of rivers and harbors as is accorded to the Committee on Appropriations in reporting general appropriation bills."

The amendment was agreed to.

Mr. REAGAN moved to reconsider the vote by which the amendment was concurred in; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The Clerk read as follows:

After the word "agriculture," in clause 8, it is proposed to insert "and forestry," and also to add to the clause the words "who shall receive the estimates and report the appropriation for the Agricultural Department;" so that, if amended, it will read as follows:

"8. To agriculture and forestry: to the Committee on Agriculture, who shall receive the estimates and report the appropriations for the Agricultural Department."

Mr. BLACKBURN. In the Committee of the Whole House there were two amendments to that clause of this rule. The first amendment consisted of the insertion of the words "and forestry," and the second amendment consisted of the additional clause, which reads, "and shall receive the estimates and report appropriations for the Agricultural Department." Upon that second amendment the Committee on Rules have instructed me to report to the House, which they have done, in their amendment, a disagreement, and upon that second amendment we want to vote. There is no objection to the first amendment.

The SPEAKER *pro tempore*. The first amendment has already been adopted. The only question now before the House is on the second amendment read. The question is on agreeing to the amendment reported by the Committee of the Whole, numbered 20, which the Clerk will again read.

The amendment was again read.

The question being put, there were—yeas 63, noes 99.

Mr. AIKEN and Mr. HATCH called for the yeas and nays.

The yeas and nays were ordered, 44 members voting therefor—more than one-fifth of the last vote.

Mr. AIKEN. I rise to make a parliamentary inquiry.

The SPEAKER *pro tempore*. The gentleman will state it.

Mr. AIKEN. I desire to know if the remark made by the Speaker of the House in Committee of the Whole when upon the floor of the House can be taken as coming *ex cathedra*.

The SPEAKER *pro tempore*. The Chair cannot recognize that as a parliamentary inquiry.

Mr. AIKEN. Has the Speaker of the House, in Committee of the

Whole, while he is upon the floor, the right to make assertions which cannot be substantiated by the record?

Mr. RANDALL, (the Speaker.) Perhaps the Chair will permit the Speaker to answer that question. He affirms all that he said in Committee of the Whole, and preposes to establish it by the record.

Mr. AIKEN. Then I ask unanimous consent of the House to reply to two or three remarks the Speaker made while he was upon the floor in Committee of the Whole.

Mr. HAZELTON. Consent is given. [Cries of "Regular order!"]

Mr. AIKEN. Why? Are you afraid of the grangers. [Laughter.] I simply desire a minute. [Cries of "Regular order!"]

The SPEAKER *pro tempore*. The gentleman from South Carolina is out of order.

Mr. AIKEN. I ask unanimous consent to be heard.

The SPEAKER *pro tempore*. The gentleman from South Carolina propounded a parliamentary inquiry to the Chair. It was answered. He now asks unanimous consent of the House to answer something that was said in Committee of the Whole.

Mr. CONGER. As a question of privilege, I understand.

The SPEAKER *pro tempore*. The Chair will submit the question to the House. The gentleman from South Carolina asks unanimous consent to answer something said in Committee of the Whole. Is there objection?

Mr. CARLISLE. I want to know if the gentleman from South Carolina proposes to discuss the amendment now before the House. If he does, I shall object unless the same privilege is allowed to other gentlemen.

Mr. BLOUNT. I object absolutely.

Mr. AIKEN. I do not propose to discuss the amendment, but wish to be put right on the record.

The SPEAKER *pro tempore*. Objection is made.

Mr. AIKEN. I see no one rising to object.

Mr. BLOUNT, (rising.) I object.

Mr. AIKEN. Why cannot you give me an opportunity? [Cries of "Regular order!"] I rise to a question of personal privilege.

The SPEAKER *pro tempore*. The yeas and nays have been ordered on the pending amendment, and the Clerk will proceed to call the roll.

Mr. RANDALL, (the Speaker.) I ask the gentleman from Georgia [Mr. BLOUNT] to withdraw his objection. I am quite ready to hear what the gentleman from South Carolina has to say, and to answer him if I can.

Mr. BLACKBURN. If this means to open up a debate—

Mr. HAZLETON. It does.

Mr. BLACKBURN. If this means to open up a debate, as the question is not debatable, I must object myself.

Mr. BLOUNT. I have not withdrawn my objection, and do not intend to.

The SPEAKER *pro tempore*. Objection is made. The Clerk will call the roll.

The question was taken; and there were—yeas 133, nays 102, not voting 57; as follows:

YEAS—133.

So the amendment was agreed to.

During the call of the roll the following announcements were made:
Mr. HUNTON. On this and all other questions coming up to-day I am paired with Mr. WHITE, of Pennsylvania.

Mr. TAYLOR. I am paired with Mr. BRIGHAM, of New Jersey.

Mr. DIBRELL. My colleague, Mr. SIMONTON, is paired with Mr. MCCOID, of Iowa.

Mr. CALKINS. I desire to announce that Mr. BELFORD, of Colorado, is paired with Mr. SPRINGER, of Illinois. I do not know how either would vote if present.

Mr. EINSTEIN. I am paired with Mr. CLARK, of New Jersey.

Mr. DAVIS, of North Carolina. I am paired with Mr. THOMPSON, of Iowa. Being advised by his friends that if present he would vote in the affirmative, I vote in the affirmative.

Mr. PRICE. My colleague, Mr. SAPP, is paired with Mr. BERRY, of California.

Mr. BOUCK. I am paired with Mr. MCKINLEY, of Ohio.

Mr. SINGLETON, of Mississippi. My colleague, Mr. CHALMERS, is absent by leave of the House, and is paired with Mr. VAN VOORHIS, of New York.

The result of the vote was then announced as above stated.

Mr. AIKEN and Mr. HATCH moved to reconsider the vote just taken; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. WHITE. I ask leave to have my vote recorded upon the question just voted on.

There was no objection.

Mr. WHITE. I vote in the affirmative.

The next amendment reported from the Committee of the Whole upon which a separate vote had been demanded was amendment No. 21, in clause 19 of Rule XI: to strike out the words "other than" and to insert in lieu thereof the word "including;" so that the clause would read as follows:

19. To the public buildings and occupied or improved grounds of the United States, including appropriations therefor: to the Committee on Public Buildings and Grounds.

Mr. BLACKBURN. In order to save time I will call now for the yeas and nays.

The yeas and nays were ordered.

The question was taken; and there were—yeas 101, nays 136, not voting 55; as follows:

YEAS—101.		
Aiken,	Ellis,	Kelley,
Aldrich, N. W.	Errett,	Kenna,

Chittenden,	Jorgensen,	Richardson, D. P.	Wright,
Clark, Alvah A.	Ketcham,	Sapp,	Young, Thomas L.
Daggett,	Kimmel,	Simonton,	

So the amendment was not agreed to.

During the call of the roll the following announcements were made:

Mr. DAVIS, of North Carolina. I am paired with Mr. THOMPSON, of Iowa.

Mr. BOUCK. I am paired with Mr. MCKINLEY, of Ohio.

Mr. WAIT. I am paired with Mr. GIBSON, of Louisiana.

Mr. VAN VOORHIS. I am paired with Mr. CHALMERS, of Mississippi.

Mr. EINSTEIN. I am paired with Mr. CLARK, of New Jersey.

Mr. SAPP. I am paired with Mr. BERRY, of California. If he were here I should vote "ay."

Mr. CALKINS. I desire to announce that Mr. BELFORD, of Colorado, is paired with Mr. SPRINGER, of Illinois. I do not know how either would vote if present.

Mr. STEPHENS. I was not present during the call of the roll. I ask permission to vote.

There was no objection.

Mr. STEPHENS voted in the negative.

Mr. BAYNE. I ask leave to vote.

There was no objection.

Mr. BAYNE voted in the affirmative.

Mr. BLACKBURN moved to reconsider the vote just taken; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The next amendment upon which a separate vote had been demanded was read, as follows:

Strike out clause 1 of Rule XXI, as follows:

Bills and joint resolutions introduced for reference and those reported by committees without such introduction, shall be read a first time by their titles and printed, the second time in full, the third time by their titles, unless the reading in full shall be demanded by a member.

And insert the following:

Every bill and joint resolution shall receive three readings before its passage, which shall be as follows, namely: the first reading by its title on its introduction for reference, or, being an original bill, on its report from a committee for commitment, or by unanimous consent for present action; the second reading in full, and the third reading by its title, unless the reading in full shall be demanded by a member.

Mr. CONGER. I observe that the clause which this amendment proposes to strike out provided that bills should be "read a first time by their titles and printed." In the proposed substitute there is no requirement that bills shall be printed. I ask whether this omission is intentional or accidental?

Mr. BLACKBURN. The Committee on Rules had no purpose to dispense with the printing of bills at all, but if the gentleman will

look at a subsequent portion of the revision, under the heading "order of business," he will find a requirement that all bills shall be printed.

Mr. CONGER. What rule does the gentleman refer to?

Mr. BLACKBURN. Rule XXIV.

Mr. HAWLEY. The second paragraph of the rule.

Mr. CONGER. That paragraph refers only to printing reports of committees.

Mr. BLACKBURN. The gentleman is right.

Mr. FRYE. I think the provision for printing has been left out by mistake.

Mr. BLACKBURN. The Committee on Rules had no intention to dispense with the printing of bills. The only question is whether an amendment to cover this omission will best come in here or in the italicized clause of Rule XXIV on page 14.

Mr. CONGER. If the provision for printing has been omitted by mistake let it be inserted.

Mr. BLACKBURN. There will be no objection, I think.

Mr. CONGER. I think the words "and printed" should be inserted in the pending amendment after the words "by unanimous consent for present action," which close up the clause in reference to the introduction of bills.

Mr. RANDALL, (the Speaker.) When bills are introduced by unanimous consent for action they are generally in manuscript; the insertion would not be appropriate at that point.

Mr. CONGER. Then let the words "and printing" be inserted after these words: "the first reading by title on its introduction for reference."

Mr. RANDALL (the Speaker) and Mr. BLACKBURN. That is right.

The SPEAKER *pro tempore*. The Chair would call attention to the fact that the Committee on Rules has reported a substitute for the amendment just read.

Mr. BLACKBURN. Yes, sir; I had failed to remember that. I ask the Clerk to read the substitute.

The Clerk read as follows:

Strike out clause 1 of Rule XXI, and the substitute therefor adopted in Committee of the Whole, and insert the following:

Every bill and joint resolution shall receive three readings before its passage, which shall be as follows: the first and second readings by title on introduction for reference, or being original bills on report from committees for commitment, except when the second reading in full shall be demanded by a member: *Provided*, That original bills on being reported by unanimous consent for present consideration shall be read the first time in full; the second and third time by title, unless the third reading in full shall be demanded by a member.

Mr. BLACKBURN. Now let me suggest to the gentleman from Michigan to turn to the italicized clause of Rule XXIV, on page 14. If when we reach that clause the gentleman will move to insert before the word "reference," in the fourth line, the words "printing and," so as to make it read "bills and joint resolutions for printing and reference," I think that will answer the purpose better than to amend the pending substitute which treats only of the reading of bills. The clause of Rule XXIV refers to their regular disposition.

Mr. CONGER. I have no objection to the gentleman's suggestion.

Mr. WARNER. It occurs to me that the phrase "or being original bills" does not agree grammatically with the beginning of the sentence where the language is "every bill and joint resolution."

The substitute proposed by the Committee on Rules for the amendment of the Committee of the Whole was adopted.

The amendment of the Committee of the Whole, as amended by the adoption of the substitute, was agreed to.

Mr. BLACKBURN moved to reconsider the vote just taken; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The next amendment on which a separate vote had been demanded was read, as follows:

In Rule XXI strike out clause 3, as follows:

"No appropriation shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures."

And insert the following:

No appropriation bill shall be reported in any general appropriation bill, or be in order as an amendment thereto, for any expenditure not previously authorized by law, unless in continuation of appropriations for such public works and objects as are already in progress. Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures by the reduction of the number and salary of the officers of the United States, by the reduction of the compensation of any person paid out of the Treasury of the United States, or by the reduction of amounts of money covered by the bill: *Provided*, That it shall be in order further to amend such bill upon the report of the committee having jurisdiction of the subject-matter of such amendment, which amendment, being germane to the subject-matter of the bill, shall retrench expenditures.

Mr. GARFIELD. Let us have the yeas and nays on this amendment.

The yeas and nays were ordered.

The question was taken; and it was decided in the affirmative—yeas 119, nays 113, not voting 60; as follows:

YEAS—119.

Acklen,	Dickey,	Lounsbury,	Scales,

Clark, Alvah A.	Hubbell,	Reed,	Wilber,
Crowley,	Huntton,	Richardson, D. P.	Wood, Walter A.

So the amendment was concurred in.

During the roll-call the following announcements were made:

Mr. BLOUNT. I am paired with Mr. REED, of Maine.

Mr. HUNTON. I am paired with Mr. BROWNE, of Indiana. If he were here, I should vote "ay."

Mr. HOOKER. On this question I am paired with Mr. LORING, of Massachusetts. If he were present, I should vote "ay."

Mr. SINGLETON, of Illinois. I am paired with Mr. MILES, of Connecticut, on this amendment and on all political questions.

Mr. DAVIS, of North Carolina. I am paired with Mr. THOMPSON, of Iowa. If he were here, I should vote "ay."

Mr. TAYLOR. I am paired with Mr. BRIGHAM, of New Jersey, on all questions.

Mr. KING. My colleague, Mr. GIBSON, who is absent by reason of illness, is paired with Mr. WAIT, of Connecticut. If present, Mr. GIBSON would vote in the affirmative and Mr. WAIT in the negative.

Mr. DIBRELL. Mr. SIMONTON is paired with Mr. MCCOID, of Iowa.

Mr. STONE. Mr. MONEY is paired with Mr. STARIN.

Mr. EINSTEIN. I am paired with Mr. CLARK, of New Jersey.

Mr. CALKINS. Mr. BELFORD is paired with Mr. SPRINGER, of Illinois.

Mr. SAPP. I am paired with Mr. BERRY, of California. If he were present, I should vote in the negative.

Mr. HARMER. I am paired with Mr. GOODE, of Virginia.

Mr. DUNNELL. Mr. RYAN, of Kansas, is paired with Mr. MAN-NING, of Mississippi.

Mr. CHITTENDEN. I am paired with Mr. BUCKNER.

Mr. BOUCK. I am paired with Mr. MCKINLEY, of Ohio. If he were here, I should vote "ay."

And then, on motion of Mr. HUNTON, by unanimous consent, the reading of the names was dispensed with.

The vote was then announced as above recorded.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was adopted; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The next amendment on which a separate vote was asked was read, as follows:

Thirty-ninth amendment. Insert as an additional clause to Rule XXI the following:

6. Upon all bills or resolutions appropriating money or creating a charge or debt upon the people the yeas and nays shall be taken on the final passage of such bills in the House, and entered on the Journal.

The substitute proposed by the Committee on Rules was then read, as follows:

Upon all general appropriation and revenue bills and bills for the improvement of rivers and harbors the yeas and nays shall be taken on the passage of such bills in the House and entered upon the Journal.

Mr. OSCAR TURNER. I rise to a parliamentary inquiry. Is it in order to move a substitute for that amendment, as follows:

That upon all bills or resolutions appropriating over \$10,000 the yeas and nays shall be taken on the final passage.

Will it be in order to offer that as an amendment?

The SPEAKER *pro tempore*. Not at this stage of the proceedings.

Mr. OSCAR TURNER. The point I make is this: as an amendment has been submitted by the Committee on Rules, would it not be in order for us to amend that or to adopt a substitute for it?

Mr. RANDALL, (the Speaker.) The previous question is pending.

Mr. OSCAR TURNER. I ask the unanimous consent of the House to offer it.

Mr. PAGE. I object.

The SPEAKER *pro tempore*. The question is on the adoption of the following substitute proposed by the Committee on Rules.

Mr. CONGER. I make the point that the amendment of the Committee on Rules was not read to the House.

The SPEAKER *pro tempore*. The Chair overrules that point of order.

Mr. CONGER. That is a question of fact.

The House divided; and the substitute proposed by the Committee on Rules was agreed to.

The question recurred on the adoption of the amendment of the Committee of the Whole on the state of the Union as it was amended.

Mr. BLACKBURN. What became of the request of my colleague from Kentucky?

The SPEAKER *pro tempore*. There was objection to the introduction of his substitute.

Mr. WHITE. But how did this amendment come in?

Mr. BLACKBURN. It was reported by the Committee on Rules and it has been adopted by this House.

The amendment of the Committee of the Whole on the state of the Union, as amended, was adopted.

Mr. BLACKBURN moved to reconsider the vote by which the amendment, as amended, was adopted; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The next amendment on which a separate vote was asked was read, as follows:

Fifty-fourth amendment. Strike out the words "to consider, first, bills raising revenue and general appropriation bills and then other business on the Calendar;" so the rule will read:

"First. That the House resolve itself into the Committee of the Whole House on the state of the Union."

Mr. RANDALL, (the Speaker.) The Committee on Rules have recommended that the words stricken out in the Committee of the Whole House on the state of the Union shall be retained. The way to reach that recommendation will be by a negative vote; that is to vote down the amendment agreed to in committee.

Mr. CALKINS. I do not understand the amendment of the Committee of the Whole House as it was read from the Clerk's desk.

Mr. FRYE. The clause of this rule as amended in the Committee of the Whole House on the state of the Union would make no sense at all, and the recommendation of the Committee on Rules is simply in favor of the retention of the words proposed to be stricken out.

Mr. BLACKBURN. That is the recommendation of the Committee on Rules, and a negative vote on concurrence in the amendment of the Committee of the Whole House on the state of the Union will comply with the recommendation of the Committee on Rules.

The amendment was disagreed to.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was disagreed to; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The next amendment on which a separate vote was asked was read, as follows:

Sixtieth amendment. Rule XXVIII, insert the following:

4. No motion to suspend the rules and pass a public bill shall be entertained

unless the bill shall have been referred to a committee, printed, and distributed to the members at least one legislative day before the motion for suspension is made.

Mr. BLACKBURN. The Committee on Rules recommend non-concurrence in that amendment.

The amendment was disagreed to.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was non-concurred in; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. CONGER. Before we proceed further I desire to call the attention of the Speaker of the House to the last part of Rule XXVI—"unless otherwise determined by a two-thirds vote of the members present and voting." I ask whether the construction would be that that would do away with any question of a quorum not being present?

Mr. RANDALL, (the Speaker.) Any member can raise the question of a quorum just as at present.

Mr. BLACKBURN. That is not in the amendment of the Committee on Rules, but is an amendment moved by the gentleman from Minnesota [Mr. DUNNELL.]

Mr. CONGER. As it stands this would seem to indicate that a less number than a quorum, two-thirds voting in favor of the proposition, could accomplish the result.

Mr. BLACKBURN. It is in the power of any member to raise the question whether a quorum has voted or not.

Mr. CONGER. It seems to me it depends entirely on the construction which may be given to this rule by the Speaker.

Mr. RANDALL, (the Speaker.) Of course the question being raised there is no House if there is no quorum. The question of a quorum is settled by the Constitution of the United States, and the gentleman need be under no misapprehension in regard to the construction of this rule.

The SPEAKER *pro tempore*. There is no question before the House. The Clerk will read the next amendment on which a separate vote has been asked.

The Clerk read as follows:

Sixty-third amendment. In Rule XXXII insert the following:

At the commencement of each Congress, the Clerk shall place in a box, prepared for that purpose, a number of small balls of marble or other material equal to the number of Members and Delegates, which balls shall be separately numbered and thoroughly intermingled, and at such hour as shall be fixed by the House for that purpose, by the hands of a page, draw said balls one by one from the box and announce the number as it is drawn, upon which announcement the Member or Delegate whose name on the numbered alphabetical list shall correspond with the number on the ball, shall advance and choose his seat for the term for which he is elected.

Mr. BLACKBURN. The Committee on Rules have offered an amendment to that.

The Clerk read as follows:

After the word "Congress," in line 1, insert the following: "immediately after the Members and Delegates are sworn in."

Also strike out "separately" and insert in lieu thereof "consecutively;" also strike out the word "the" before "numbered" and insert "a."

The amendments to the amendment were agreed to, and the amendment of the Committee of the Whole House as amended was concurred in.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was agreed to; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

The Clerk read amendment No. 71, to add to Rule XXXVIII as a second clause the following:

2. The Clerk of the House shall, within three days after the final adjournment of a Congress, take into his keeping all bills, joint resolutions, and other papers referred to committees, together with all evidence or testimony taken by committees under the order of the House.

For which the Committee on Rules proposed the following substitute:

2. The clerks of the several committees of the House shall, within three days after the final adjournment of a Congress, deliver to the Clerk of the House all bills, joint resolutions, petitions, and other papers referred to the committee, together with all evidence taken by such committee under the order of the House during the said Congress, and not reported to the House; and in the event of the failure or neglect of any clerk of a committee to comply with this rule, the Clerk of the House shall, within three days thereafter, take into his keeping all such papers and testimony.

The amendment of the Committee on Rules was agreed to.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was agreed to; and also moved to lay the motion to reconsider on the table.

The latter motion was agreed to.

The SPEAKER *pro tempore*. The Clerk will now report the amendment proposed by the Committee on Rules to Rule IV, clause 1.

The Clerk read as follows:

Strike out the words "in person" after the word "attend;" so that it will read: "1. It shall be the duty of the Sergeant-at-Arms to attend the House during its sittings, to maintain order under the direction of the Speaker, and, pending the election of a Speaker or Speaker *pro tempore*, under the direction of the Clerk; execute the commands of the House and all processes issued by authority thereof, directed to him by the Speaker; keep the accounts for the pay and mileage of Members and Delegates and pay them as provided by law."

The amendment was agreed to.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was agreed to; and also moved to lay the motion to reconsider on the table.

The latter motion was agreed to.

The Clerk read the amendment proposed by the Committee on Rules to clause 7, Rule XIV, as follows:

Strike out the word "is," before the word "charged," and insert "and Doorkeeper are;" so that the clause will read: "And the Sergeant-at-Arms and Doorkeeper are charged with the strict enforcement of this clause."

Mr. RANDALL, (the Speaker.) That relates to smoking on the floor.

Mr. BLACKBURN. And the amendment charges the Doorkeeper as well as the Sergeant-at-Arms with the enforcement of the rule.

Mr. RANDALL, (the Speaker.) We want everybody we can call into the service to prevent smoking in the seats.

The amendment was agreed to.

The Clerk read the following amendment proposed by the Committee on Rules to clause 9 of Rule XI:

After the word "nations" insert the words "other than appropriations;" so that it will read:

"9. To the relations of the United States with foreign nations other than appropriations: to the Committee on Foreign Affairs."

Mr. BLACKBURN. The leaving out of those words was simply a mistake. They are incorporated in all the other provisions.

The amendment was agreed to.

Mr. BLACKBURN moved to reconsider the vote by which the amendment was agreed to; and also moved to lay the motion to reconsider on the table.

The latter motion was agreed to.

The Clerk read the following amendment proposed by the Committee on Rules to clause 14 of Rule XI:

After the word "tribes" insert "other than appropriations;" so that it will read:

"To the relations of the United States with the Indians and the Indian tribes, other than appropriations: to the Committee on Indian Affairs."

Mr. BLACKBURN. The same explanation applies to this as to the former amendment.

The amendment was agreed to.

Mr. HOUSE. I now ask, as I understand we are through with all the amendments, unanimous consent to offer the amendment which I had read at the Clerk's desk for information this morning.

The SPEAKER *pro tempore*. Is there objection to the request of the gentleman from Tennessee?

Mr. FRYE and others objected.

Mr. GARFIELD. I desire to make a suggestion as to the time when the new rules shall come into operation.

Mr. RANDALL, (the Speaker.) Let that be done after the final vote.

Mr. GARFIELD. I think it should be made before the final vote. We cannot have these rules adopted so as to take effect to-morrow morning. The old *régime* and the new cannot jump together at the instant; and I have written a resolution on which I think it would be better to take action now than later. I will read it for the information of the House:

Resolved, That the foregoing rules shall be a substitute for all existing rules, and take effect at noon on Monday next, at which time the Speaker shall present to the House the calendars herein provided for, which shall contain all the measures now pending before the House or the Committee of the Whole in their proper order according to these rules: *Provided*, That in carrying these rules into effect the Speaker shall not be required to increase or diminish the numbers of any standing committees during the present Congress.

Mr. RANDALL, (the Speaker.) Or to vacate any of the committees.

The SPEAKER *pro tempore*. There are still some amendments pending on which action has not been taken.

Mr. GARFIELD. I have called attention to this resolution which I desire to offer, as there is danger we will break up as soon as the final vote is taken.

Mr. RANDALL, (the Speaker.) I would suggest also that it be provided as to existing special orders that they shall be continued.

Mr. GARFIELD. I do not think that is necessary. The Speaker will submit a calendar, subject to the correction of the House, and the existing special orders would be on that calendar.

Mr. RANDALL, (the Speaker.) The Chair would, no doubt, hold they would be continued. At the same time, the House might as well relieve the Chair of making that decision.

Mr. GARFIELD. The Chair has already stated what he would do, and it is evidently right. But when he presents the Calendar on Monday next, it would be open to anybody to object if he found occasion to do so.

Mr. BLACKBURN. I should like the gentleman from Ohio to accept the suggestion, not only to provide against disturbing the existing committees under the present rules, but also to give protection for all special orders as they now stand.

Mr. ROBINSON. I desire to make an inquiry of the Chair. What is the pending question?

The SPEAKER *pro tempore*. The amendments are not yet completed on which the previous question is operating.

The Clerk read an amendment proposed to clause 5 of Rule XXIV, as follows:

After the word "which" insert the words "the motion;" so that it will read: "Unfinished business having been disposed of, it shall be in order to entertain a motion that the House do now proceed to the business on the Speaker's table, which, the motion prevailing, the Speaker shall dispose of in the following order," &c.

Mr. BLACKBURN. That is right.

The amendment was agreed to.

The Clerk read an amendment proposed to Rule XXVII, which was to transpose certain words so that the rule would read as follows:

After six days from the commencement of a second or subsequent session of any Congress, all bills, resolutions, and reports which originated in the House, and remained undetermined at the close of the last preceding session, shall be in order for action, and all business before committees of the House at the end of one session shall be resumed at the commencement of the next session of the same Congress in the same manner as if no adjournment had taken place.

Mr. BLACKBURN. That is right.

The amendment was agreed to.

The Clerk read an amendment proposed to Rule XXXVII, to strike out the word "summoned" and insert the word "subpoenaed."

The amendment was agreed to.

The Clerk read an amendment proposed to Rule XXXIX, to strike out the word "so" before the words "withdrawn therefrom;" so that the rule would read as follows:

No memorial or other paper presented to the House shall be withdrawn from its files without its leave, and if withdrawn therefrom, certified copies thereof shall be left in the office of the Clerk, &c.

The amendment was agreed to.

Mr. BLACKBURN. I move to reconsider the various votes just taken upon amendments, and also move that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. YOUNG, of Tennessee. I ask unanimous consent for leave to print in the RECORD as a portion of the debates some remarks upon these rules.

There was no objection, and leave was granted accordingly. [See Appendix.]

Mr. ROBINSON. I desire to make a suggestion in regard to clause 8 of Rule XI, in relation to the Committee on Agriculture. The House having authorized the Committee on Agriculture to report the appropriations necessary for that Department, it seems to me that we should go further and give that committee leave to report at any time.

Mr. GARFIELD. Oh, no.

Mr. ROBINSON. I mean to report at any time upon the subject of appropriations. I care nothing about the matter myself. I voted against the amendment giving the committee that authority. But as we have gone so far as to give that committee the right to report an appropriation bill, I think we should also give the committee the right to report such appropriation bill at any time.

Mr. FRYE. No.

Mr. ROBINSON. I only make the suggestion.

Mr. BURROWS. I have a suggestion to make in relation to the order in which these rules are stated. The first rule relates to the "duties of the Speaker;" the second rule relates to the "election of officers." Then the third, fourth, fifth, sixth, and seventh rules relate to the duties of particular officers of the House. Would it not be better to reverse the order of the first and second rules, and let the second rule in relation to the "election of officers" be the first rule, and then let the rules in relation to the duties of officers follow that?

Mr. RANDALL, (the Speaker.) The committee considered that question.

Mr. BURROWS. I will not press it.

Mr. FRYE. I desire to make an inquiry. The Committee on Rules, as I understood, determined to demand a yeas-and-nays vote on clause 7 of Rule XI, in relation to the right of the Committee on Commerce to report appropriation bills for the improvement of rivers and harbors.

Mr. CARLISLE. That was adopted.

Mr. HAWLEY. And without a yeas-and-nays vote.

Mr. GARFIELD. I have prepared the resolution which I indicated, and I think if the House will hear it read there will be no objection to it.

Mr. RANDALL, (the Speaker.) Let it come in after the rules have been adopted.

The SPEAKER *pro tempore*. The question is now upon adopting the rules as amended.

Mr. CONGER. I move that clause 3 of Rule XXI be stricken out.

Mr. BLACKBURN. That is not in order; the previous question is still operating.

Mr. CONGER. The previous question is not operating upon the adoption of the report.

Mr. BLACKBURN. The previous question is not yet exhausted; it was called upon the report and all amendments thereto.

The SPEAKER *pro tempore*. The Chair must sustain the point of order.

Mr. CONGER. Let the record of the action of the House in that regard be read.

Mr. BLACKBURN. I take it that the previous question is not exhausted until the question is taken on the adoption of the report.

Mr. CLARKE, of Missouri. I call for the regular order.

The SPEAKER *pro tempore*. Is there objection to the amendment proposed by the gentleman from Michigan?

Mr. RANDALL, (the Speaker.) There is.

Mr. CONGER. I do not ask consent to offer that amendment. I ask that the record be read in order to show whether the previous question applies to the adoption of the whole report.

The SPEAKER *pro tempore*. That is the opinion of the Chair.

Mr. CONGER. Let that portion of the Journal be read.

The SPEAKER *pro tempore*. The Journal is not yet made up.

Mr. CONGER. Then let the minutes of the journal clerk be read.

Mr. BLACKBURN. The Speaker has decided the point of order.

Does the gentleman appeal?

Mr. CONGER. I would like to hear the record read.

Mr. CLYMER. Let the Journal be read.

The SPEAKER *pro tempore*. The clerk will read the minutes of his Journal.

The journal clerk [Mr. Smith] read as follows:

Mr. BLACKBURN moved that the morning hour be dispensed with; which motion was agreed to, two-thirds voting in favor thereof.

Mr. BLACKBURN further moved that the House proceed to the consideration of the report of the Committee on Rules, submitting revised rules, reported from the Committee of the Whole House on the state of the Union, with amendments, on Friday last, and pending when the House then adjourned; which said motion was agreed to.

Mr. BLACKBURN demanded the previous question on the adoption of the report of the Committee on Rules as amended by the Committee of the Whole House on the state of the Union, together with amendments submitted by the Committee on Rules thereto.

The previous question was seconded and the main question ordered.

Mr. BLACKBURN moved to reconsider the vote by which the main question was ordered; and also moved that the motion to reconsider be laid on the table, which latter motion was agreed to.

Mr. BLACKBURN. That settles it.

The SPEAKER *pro tempore*. That would seem to end the matter.

Mr. CONGER. It was not so stated at the time as to be understood. I say that most positively and distinctly.

Mr. BLACKBURN. What was not understood?

Mr. CONGER. The motion of the gentleman was not stated so as to be understood by me and others on this side.

Mr. BLACKBURN. It was not my fault, for it was stated by me in as distinct tones as I could employ.

Mr. CONGER. The gentleman stated that he demanded the previous question on the amendments.

Mr. BLACKBURN. I stated three times over that I demanded the previous question on the report as well as on the amendments.

Mr. CLYMER. And I heard the gentleman when he did it.

Mr. RANDALL, (the Speaker.) The RECORD will show that I made the suggestion to the gentleman from Kentucky to include the report in his demand of the previous question; and he did it.

Mr. CONGER. I demand the yeas and nays on the adoption of these rules. I do this because it gives us the only opportunity we can have to vote against this principle of political riders.

The yeas and nays were ordered.

The question was taken; and there were—yeas 122, nays 88, not voting 82; as follows:

YEAS—122.

Crowley,	Jones,	Reed,	
Daggett,	Jorgensen,	Richardson, D. P.	

So the report of the Committee on Rules, as amended, was adopted. During the roll-call the following announcements were made:

Mr. GODSHALK. My colleague, Mr. HARMER, is paired with the gentleman from Virginia, Mr. GOODE.

Mr. CHITTENDEN. I am paired with the gentleman from Missouri, Mr. BUCKNER.

Mr. HOOKER. On this question I am paired with the gentleman from Massachusetts, Mr. LORING.

Mr. SHELLEY. I am paired with the gentleman from Michigan, Mr. STONE. If he were present, I should vote in the affirmative.

Mr. DAVIS, of North Carolina. I am paired with the gentleman from Iowa, Mr. THOMPSON. If he were here, I should vote "ay."

Mr. DIBRELL. My colleague, Mr. SIMONTON, is paired with the gentleman from Iowa, Mr. MCCOID, and my colleague, Mr. TAYLOR, with the gentleman from New Jersey, Mr. BRIGHAM.

Mr. KING. My colleague, Mr. ELAM, who is absent by reason of illness, is paired with the gentleman from Pennsylvania, Mr. DICK. My colleague, Mr. GIBSON, who is absent on account of indisposition, and who is paired with the gentleman from Connecticut, Mr. WAIT, would, if present, vote "ay." The gentleman from Connecticut would vote "no."

Mr. TILLMAN. The gentleman from Virginia, Mr. JOHNSTON, is paired with the gentleman from Indiana, Mr. ORTA.

Mr. SINGLETON, of Mississippi. My colleague, Mr. CHALMERS, who is paired with the gentleman from New York, Mr. VAN VOORHIS, would, if present, vote "ay."

Mr. CABELL. My colleague, Mr. HUNTON, is paired with the gentleman from Indiana, Mr. BROWNE. My colleague, if present, would vote "ay."

Mr. ALDRICH, of Rhode Island. I am paired with the gentleman from Alabama, Mr. LEWIS.

Mr. HASKELL. My colleague, Mr. RYAN, who is paired with the gentleman from Mississippi, Mr. MANNING, would, if present, vote "no."

Mr. BOUCK. I am paired with the gentleman from Ohio, Mr. McKINLEY. If he were present, I should vote "no."

Mr. WHITE. I am paired with my colleague, Mr. BELTZHOVER. If he were present, I should vote "no;" I presume he would vote "ay."

Mr. SAPP. I am paired with the gentleman from California, Mr. BERRY. If at liberty to vote, I should vote "no."

Mr. CALKINS. The gentleman from Colorado, Mr. BELFORD, is paired with the gentleman from Illinois, Mr. SPRINGER.

Mr. BAILEY. My colleague, Mr. EINSTEIN, is paired with the gentleman from New Jersey, Mr. CLARK.

The result of the vote was announced as above stated.

Mr. BLACKBURN moved to reconsider the vote just taken; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. BLACKBURN submitted the following resolution; which was read, considered, and adopted:

Resolved, That 5,000 copies of the rules of the House, properly indexed, be printed under the direction of the journal clerk, for the use of the House.

Mr. BLACKBURN moved to reconsider the vote by which the resolution was adopted; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Mr. GARFIELD. I offer the resolution which I send to the desk. The Clerk read as follows:

Resolved, That the foregoing rules, just adopted as a substitute for all existing rules of the House, shall take effect and be in force from and after the hour of noon on Monday next, on which day, after the reading of the Journal, the Speaker shall present to the House the calendars provided for in these rules, on which shall be entered in proper order all the measures now pending before the House or the Committee of the Whole: *Provided*, That in carrying these rules into effect no standing committee shall be abolished, nor the number of the same decreased, during the present Congress; nor shall any existing special order be set aside.

Mr. DUNNELL. This resolution will not prevent the Speaker from making additional appointments during this session upon committees whose numbers are increased?

Mr. GARFIELD. No, sir; where the new rules provide for an increase that can be carried out. I call for the previous question.

The previous question was seconded and the main question ordered; and under the operation thereof the resolution was adopted.

Mr. GARFIELD moved to reconsider the vote by which the resolution was adopted; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

INDEX.

GEOLOGICAL REPORT

LAKE LAHONAN

A DEPARTMENT OF THE GEOLOGICAL SURVEY

BY J. W. COOK, U.S. GEOLOGIST

WASHINGTON

GOVERNMENT PRINTING OFFICE

WASHINGTON, D. C., *March* 28, 1885.

SIR: I have the honor to submit for publication a memoir on Lake Lahontan by Mr. I. C. Russell.

The principal work of my Division has been the investigation of the Quaternary lakes of the Great Basin. In this investigation Mr. Russell has been my principal assistant since the year 1880. During the first season he accompanied me in the field for the purpose of familiarizing himself with the methods of research which had been developed in the course of the earlier work, but in subsequent years he was assigned independent districts. His report on the most important of these is communicated in the present volume.

After the completion of his field work, I visited some of the more instructive localities of the Lahontan basin and repeated his observations. I am thus familiar not only with his methods but with some of the principal facts which he discusses, and am enabled from personal knowledge to characterize his work as accurate and thorough.

Very respectfully, your obedient servant,

G. K. GILBERT,

Geologist in Charge, Division of the Great Basin.

Hon. J. W. POWELL,

Director U. S. Geological Survey.

▼

Washington, D. C., July 28, 1882

Dear Sir: I have the honor to acknowledge the receipt of your letter of the 27th inst. by Mr. E. T. Howell.

The principal point of the letter is the question of the Government's title to the Great Falls. It is the Government's title to the falls and the right of the people to use the falls for the purpose of generating power. The Government's title to the falls is derived from the fact that the falls are situated on the public lands of the United States. The Government's title to the falls is derived from the fact that the falls are situated on the public lands of the United States. The Government's title to the falls is derived from the fact that the falls are situated on the public lands of the United States.

After the completion of the report, it will be the duty of the Commission to report to the President and the Senate. The Commission will also report to the President and the Senate on the progress of the work. The Commission will also report to the President and the Senate on the progress of the work. The Commission will also report to the President and the Senate on the progress of the work.

Very respectfully,
Your obedient servant,

U. S. COMMISSIONER

Enclosed is a copy of the report of the Commission.

Hon. J. M. McKim

Secretary of the Interior

P R E F A C E .

The explorations reported in the present volume are a continuation of the studies of the Quaternary geology of the Great Basin begun by Mr. G. K. Gilbert when the present survey was organized. The work has been carried out under Mr. Gilbert's direction, and to him I am indebted not only for every facility he could offer for advancing my work, but also for important advice and numerous suggestions. Whatever value may be attached to the results of my labors will be due in great measure to the wisdom and unvarying kindness of the Chief of the Division of the Great Basin.

With the exception of the reconnaissance of 1881, I have had the assistance of Mr. Willard D. Johnson in all matters relating to topography throughout both the field and office work connected with the preparation of this volume. The energy and completeness with which he has carried forward his special work under peculiar difficulties, not met with outside the desert regions of the Far West, deserve the highest praise. The accuracy of the accompanying maps that Mr. Johnson has drawn from his own survey will make them a reliable basis for determining future changes in the lakes and rivers of the region explored.

During the summer of 1882, I was accompanied by Messrs. W J McGee and George M. Wright, as geological aids, and to each I have the pleasure of crediting much valuable assistance. The accompanying drawings of geological sections will attest the accuracy of Mr. McGee's work.

The survey of nearly 8,500 square miles in northern Nevada, which was necessary in order to compile the accompanying pocket map and many of the smaller illustrations, was carried out by Mr. A. L. Webster, assisted

by Mr. Eugene Ricksecker. It is to be hoped that Mr. Webster's work will be issued as an independent atlas sheet, in order that its full value may be appreciated.

Since this report was written the analyses by Prof. F. W. Clarke and Dr. T. M. Chatard, contained in the following pages, have been published in Bulletin No. 9 of this Survey, to which the reader is referred for additional information in reference to methods of analysis.

GEOLOGICAL HISTORY OF LAKE LAHONTAN

BY ISRAEL C. RUSSELL.

ABSTRACT OF MONOGRAPH

The present volume records the history of a large lake which flooded a number of the valleys of northwestern Nevada at a very recent geological date, but has now passed away. This ancient water-body is known as Lake Lahontan—named in honor of Baron La Hontan, one of the early explorers of the headwaters of the Mississippi—and occupies the same position as Lake Bonneville. The former, situated mostly within the State of Nevada, filled a depression along the western base of the Great Basin at the base of the Sierra Nevada; the latter, which occupied almost entirely in the present Territory of Utah, occupied a corresponding position on the east side of the Great Basin, at the foot of the Sierrita Mountains. The hydrographic basins of these two water-bodies embraced the entire width of the Great Basin in latitude 41°. Lake Bonneville covered 19,750 square miles in area, and had a maximum depth of about 1,000 feet. Lake Lahontan covered 8,422 square miles of surface, and in the deepest part, the present site of Pyramid Lake, was 886 feet in depth. The ancient lake of Utah overflowed northward and cut down its channel of discharge 370 feet. The ancient lake of Nevada did not overflow. Each of these lakes had two high-water stages, separated by a time of desiccation. In the Lahontan Basin, as in the Bonneville, the first great rise was preceded

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

BY ISRAEL C. RUSSELL.

ABSTRACT OF MONOGRAPH.

The present volume records the history of a large lake which flooded a number of the valleys of northwestern Nevada at a very recent geological date, but has now passed away. This ancient water-body is known as Lake Lahontan—named in honor of Baron La Hontan, one of the early explorers of the headwaters of the Mississippi—and was the complement of Lake Bonneville. The former, situated mostly within the area now forming the State of Nevada, filled a depression along the western border of the Great Basin at the base of the Sierra Nevada; the latter, embraced almost entirely in the present Territory of Utah, occupied a corresponding position on the east side of the Great Basin, at the foot of the Wasatch Mountains. The hydrographic basins of these two water-bodies embraced the entire width of the Great Basin in latitude 41° . Lake Bonneville was 19,750 square miles in area, and had a maximum depth of about 1,000 feet. Lake Lahontan covered 8,422 square miles of surface, and in the deepest part, the present site of Pyramid Lake, was 886 feet in depth. The ancient lake of Utah overflowed northward and cut down its channel of discharge 370 feet. The ancient lake of Nevada did not overflow. Each of these lakes had two high-water stages, separated by a time of desiccation. In the Lahontan Basin, as in the Bonneville, the first great rise was preceded

by a long period of desiccation, and was followed by a second dry epoch, during which the valleys of Nevada were even more completely desert than at present. During the second flood stage the lake rose higher than at the time of the first high water, and then evaporated to complete desiccation. The present lakes of the basin are of comparatively recent date, and are nearly fresh, for the reason that the salts deposited when the Quaternary lake evaporated were buried or absorbed by the clays and marls that occupy the bottom of the basin.

As Lake Lahontan did not overflow, it became the receptacle for all the mineral matter supplied by tributary streams and springs both in suspension and in solution. The former was deposited as lacustral sediments and the latter as calcareous tufa, or formed desiccation products when the lake evaporated.

The introductory chapter indicates the position of the field of study, and contains a sketch of the Great Basin, as the explorer finds it to-day, of which the desiccated bed of Lake Lahontan forms a part; also a brief notice of previous explorations, and an account of what was known of Lake Lahontan before the present study was begun. Routes of travel and areas surveyed are indicated on Plate II.

Chapter II (on the genesis of Lake Lahontan) contains a summary of the facts which show that the lake filled a compound orographic basin, resulting from the tilting of faulted beds. A description is given of the character of the irregular area whose drainage the lake received, together with an account of the outline and area of the basin which held the ancient lake.

The question of outlet is discussed in detail, the conclusion being that the lake did not overflow (page 32).

Chapter III (on the physiography of the Lahontan Basin) contains a description of the region as it exists at the present time. The most distinctive characteristics of the valleys and mountains are briefly noticed; an account of the existing rivers is given, including measurements of volume, chemical composition, etc. The present springs of the basin are also described and analyses of the waters of a few of them presented. These analyses are believed to represent approximately the character of the tribu-

taries of Lake Lahontan. The existing lakes are next considered. These are Honey Lake, California; Pyramid, Winnemucca, Humboldt, North Carson, South Carson, and Walker lakes, Nevada. Each of these is described with some detail with special reference to its geological bearings. All the lakes mentioned above, excepting Humboldt, are inclosed, *i. e.*, are without outlet, and their waters are somewhat saline and alkaline, but not concentrated brines. They cannot, therefore, be considered as remnants left by the incomplete desiccation of Lake Lahontan. The Soda lakes, near Ragtown, Nevada, are specially considered, and detailed observations are presented which show that they occupy extinct volcanic craters (page 73). Attention is given, on page 81, to the peculiar playas or broad mud-plains of the arid region of the Far West, as well as to the temporary lakes, called playa-lakes, which frequently flood them.

Chapter IV (on the physical history of Lake Lahontan) is divided into sections.

Section 1 contains a compendious discussion of shore phenomena in general.

Section 2 is devoted to the presentation of the shore phenomena of Lake Lahontan, and contains detailed descriptions and maps of the terraces, bars, embankments, etc., that were formed about its shores. The highest of the ancient water lines is named the "Lahontan Beach." It indicates the maximum extent of the lake as shown on the accompanying pocket map. The most conspicuous terraces below the Lahontan Beach are the "Lithoid", "Dendritic", and "Thinolitic." Each of these marks the upper limit of a variety of tufa from which it derives its name (page 102).

Section 3 treats of the sediments of the lake and presents detailed sections of the exposures observed. The sediments consist of two deposits of lacustral marls, separated by a heavy layer of current-bedded gravels; thus recording two lake periods and an intermediate low-water stage (page 43).

Accumulations of pumiceous dust, white marl, and aeolian sands are described under the head of Exceptional Sedimentary Deposits (page 146).

Section 5 is devoted to the illustration of geological structure, as displayed in the lake basin, and is followed by a résumé of the physical history of the lake (page 169).

Chapter V (on the chemical history of Lake Lahontan) is also divided into sections.

Section 1 treats of the general chemistry of natural waters as they occur in streams, springs, lakes, oceans, and inclosed lakes or seas, and is an introduction to the chemical history of Lake Lahontan.

Section 2 is an account of the tufas precipitated from the water of the lake. These present three main divisions, named, respectively, "Lithoid," "Thinolitic," and "Dendritic." The first is a compact, stony variety, and is the oldest of the principal calcareous deposits that sheath the interior of the basin. It occurs from a horizon thirty feet below the Lahontan beach all the way down the sides of the basin to the lowest point now exposed to view (page 190). Thinolite is composed of crystals, and was formed in the ancient lake when it was greatly reduced by evaporation; its upper limit is about 400 feet below the Lahontan beach (page 192). Dendritic tufa has a branching or dendritic structure, whence its name; it is superimposed upon the previously-formed varieties. Its upper limit is 180 feet below the Lahontan beach (page 201). The aggregate thickness of the tufa deposits is from thirty to perhaps fifty or seventy-five feet. Chemical analyses show that all the varieties are composed of somewhat impure calcium carbonate. Following the description of these deposits is a discussion of the conditions favoring the deposition of calcareous tufa from lake waters (page 210).

Section 3 considers the salts precipitated from the waters of the lake when evaporation took place, and discusses the manner in which lakes may be freshened by desiccation (page 223).

Section 4 contains an account of the efflorescences now forming on the surface of the deserts in the Lahontan Basin, and presents a brief description of the more valuable salt-works of the region, which are all supplied by the salts contained in Lahontan sediments (page 230).

Chapter VI presents the life history of the ancient lake as determined from the abundant molluscan remains and other fossils that have been found. The shells show that the lake was fresh throughout its higher stages. During the period when thinolite was formed it seems to have been too concentrated to admit of the existence of molluscan life, as no fossils have been found in that deposit. A chipped implement discovered in the upper lacustral beds

indicates that man inhabited the Far West during the last rise of Lake Lahontan (page 247).

Chapter VII is a summary of the history of the former lake (page 250).

Chapter VIII contains a discussion of the Quaternary climate as determined from the records of Lake Lahontan. The periods of greatest lake expansion are correlated with the two glacial epochs of the Sierra Nevada, and are believed to indicate cold and moderately humid periods (page 259). That the lake did not overflow is taken as evidence that the climate, even during the high stages of the lake, was only moderately humid. The climatic changes that brought about such marked alterations in the character of the Great Basin are thought to have been of moderate intensity.

Chapter IX is devoted to a summary of the evidence bearing on the determination of the geological age of the lake. The conclusion reached is that it existed during the Quaternary, but was more recent than the date usually assigned for the close of the glacial epoch.

Chapter X brings the present study to a close, and contains an account of the orographic movements that have affected the Lahontan basin since the last high-water period. The post-Lahontan faults actually observed are represented on Plate XLV.

CHAPTER I.

INTRODUCTORY.

THE FIELD OF STUDY.

The region treated of in the present volume embraces about 90,000 square miles in northwestern Nevada, together with small portions of southern Oregon and eastern California.

The object of the explorations herewith reported was the study of the Quaternary geology of the country visited, and particularly the geological history of Lake Lahontan—a lake, now extinct, which occupied many of the valleys of northwestern Nevada at a very recent geological date. The basin of Lake Lahontan is one of the many independent drainage areas of which the Great Basin is composed, and its geology is a page in the history of the vast region lying between the Rocky Mountains and the Sierra Nevada.

The Great Basin is to-day an arid region, but during the Quaternary its climate was probably colder and more humid than at present. The Sierra Nevada and Wasatch ranges, now for the most part bare of snow during the summer, were formerly crowned with vast névés from beneath which flowed many magnificent ice-rivers; the desert ranges of Utah and Nevada were also snow-covered, and some of them gave birth to local glaciers. The valleys which are now dry and treeless, and in many instances absolute deserts, destitute of any kind of vegetation over hundreds of square miles, were then occupied by lakes, the largest of which were comparable in extent and depth with those now drained by the Saint Lawrence. Some of these old lakes had outlets to the sea and were the sources of considera-

ble rivers, others discharged into sister lakes; a considerable number, however, did not rise high enough to find outlet, but were entirely inclosed, as is the case with the Dead Sea, the Caspian, and many of the lakes of the Far West at the present time. The largest of the Quaternary lakes of the Great Basin, thus far explored, has been very fully described by Mr. Gilbert and others under the name of Lake Bonneville. The second in size, Lake Lahontan, is the subject of the present report.

The topography of the region to which we wish to direct attention, together with its Quaternary hydrography, is represented on the accompanying pocket map. The relation of the region to the entire area of interior drainage, and the more general geography of the Far West, is indicated on the frontispiece. Before presenting the results of our geological observations it seems desirable to glance briefly at some of the more prominent characteristics of the region of interior drainage of which the district to be described is a component part.

THE GREAT BASIN.

In crossing from the Atlantic to the Pacific, between the Mexican boundary and the central portion of Oregon, one finds a region, bounded by the Sierra Nevada on the west and the Rocky Mountain system on the east, that stands in marked contrast in nearly all its scenic features with the remaining portions of the United States. The traveler in this region is no longer surrounded by the open, grassy parks and heavily-timbered mountains of the Pacific slope, or by the rounded and flowing outlines of the forest-crowned Appalachians, and the scenery suggests naught of the boundless plains east of the Rocky Mountains or of the rich savannas of the Gulf States. He must compare it rather to the parched and desert areas of Arabia and the shores of the Dead Sea and the Caspian.

To the geographer the most striking characteristic of the country stretching eastward from the base of the Sierra Nevada is that it is a region of interior drainage. For this reason it is known as the "Great Basin." No streams that rise within it carry their contributions to the

ocean, but all the snow and rain that falls inside the rim of the basin is returned to the atmosphere, either by direct evaporation from the soil or after finding its way into some of the lakes that occupy the depressions of the irregular surface. The climate is dry in the extreme, the average yearly rainfall probably not exceeding 12 or 15 inches.

The area thus isolated from oceanic water systems is 800 miles in length from north to south, and nearly 500 miles broad in the widest part, and contains not far from 208,500 square miles—an area nearly equal to that of France. The southern part of the region includes the Colorado Desert, Death Valley, and much of the arid country in southern California and Nevada. In northern Nevada the Carson and Black Rock deserts exhibit the extreme of desolation. The most northerly part of the Great Basin, occupying the central portion of Oregon, is less barren, its rugged surface abounding in long and narrow mountain ranges, volcanic table lands, and isolated mesas, weathering as they grow old into rounded buttes, that are covered with luxuriant bunch-grass and bear a scattered growth of cedars and pines. At the south the valleys of the Great Basin are low-lying, Death Valley and the Colorado Desert being depressed below the level of the sea; but at the north the valleys have a general elevation of from 4,000 to 5,000 feet, while the intervening mountain ranges rise from 5,000 to 7,000 feet above them.

Diversifying this region are many mountain ranges and broad desert valleys, together with rivers, lakes, and cañons, topographic elements to be found in all quarters of the world, but here characterized by features peculiar to the Great Basin. The mountains exhibit a type of structure not described before this region was explored, but now recognized by geologists as the "Basin Range structure." They are long narrow ridges, usually bearing nearly north and south, steep upon one side, where the broken edges of the composing beds are exposed, but sloping on the other, with a gentle angle conformable to the dip of the strata. They have been formed by the orographic tilting of blocks that are separated by profound faults, and they do not exhibit the anticlinal and synclinal structures commonly observed in mountains, but are monoclinal instead.

The valleys or plains separating the mountain ranges, far from being fruitful, shady vales, with life-giving streams, are often absolute deserts, totally destitute of water, and treeless for many days' journey, the gray-green sagebrush alone giving character to the landscape. Many of them have playas in their lowest depressions—simple mud plains left by the evaporation of former lakes—that are sometimes of vast extent. In the desert bordering Great Salt Lake on the west and in the Black Rock Desert of northern Nevada are tracts hundreds of square miles in area showing scarcely a trace of vegetation. In winter, portions of these areas are occupied by shallow lakes, but during the summer months they become so baked and hardened as scarcely to receive an impression from a horse's hoof, and so sun-cracked as to resemble tessellated pavements of cream-colored marble. Other portions of the valleys become incrustated to the depth of several inches with alkaline salts which rise to the surface as an efflorescence and give the appearance of drifting snow. The dry surface material of the deserts is sometimes blown about by the wind, saturating the air with alkaline particles, or is caught up by whirlwinds and carried to a great height, forming hollow columns of dust. These swaying and bending columns, often two or three thousand feet high, rising from the plains like pillars of smoke, form a characteristic feature of the deserts.

Most of the rivers of the Great Basin have their sources in the melting snows of the mountains which form its eastern and western borders, and flow into the desert valleys within the rim of the undrained area. Of such the Bear, Weber, and Sevier rivers are examples along the eastern border; on the west the Truckee, Carson, and Walker rivers have a similar origin and destiny. A single river, the Humboldt, is anomalous in that both its source and its terminus are well within the area of interior drainage.

The rivers of the Great Basin vary greatly in volume with the varying seasons, and some of them disappear entirely during the hot summer months. In the streams that are perennial a high percentage of the annual discharge is crowded into a brief space toward the end of the rainy season. Thus the arteries of this parched and heated country make but one feverish pulsation in a year. The streams usually diminish in volume as they descend into the valleys, and in many instances their waters are lost on the thirsty

deserts and their channels run dry. In general they are larger near their sources than at their mouths. Commonly, too, instead of being pure, sparkling waters, refreshing to the lips as well as to the eye, they are heavy with sediment and bitter and alkaline to the taste.

The lakes into which much of the surface drainage finds its way are commonly saline and alkaline—their shores desert wastes, shunned by animals and by all but salt-loving plants. Of the saline lakes, the typical example is furnished by Great Salt Lake in Utah, an inland sea whose features call to mind the familiar descriptions of the Dead Sea in Palestine. Mono Lake in California, and Abert and Summer lakes in Oregon, are also highly charged with saline matter, and are remarkable for the amount of sodium and potassium salts which they contain. Pyramid, Walker, Winnemucca, and Carson lakes in Nevada, as well as many smaller lakes throughout the Great Basin, are also without outlets, but yet, contrary to what we would expect, they hold but comparatively small percentages of saline matter in solution.

Other lakes, which indicate still more pointedly the contrast between an arid and a humid climate, we may call *playa-lakes*. These are sheets of shallow water, covering many square miles in the winter season, but evaporating to dryness during the summer, their beds becoming hard, smooth mud-plains or *playas*. In many instances a lake is formed on a playa during a single stormy night, only to disappear beneath the next noonday sun. When the weather is unsettled these lakes are scarcely more permanent than the delusions of the mirage, but come and go with every shower that passes over the land. Other *playa-lakes* retain their integrity for a longer period, and only become dry during excessively arid seasons. Examples of these are furnished by Honey Lake in California, North Carson Lake ("Carson and Humboldt Sink") in Nevada, and Sevier Lake in Utah, all of which have been known to become dry during the past few years. The water of *playa-lakes* has a greenish yellow color, due to the extremely fine silt which is held in suspension and not allowed to settle, because every breeze stirs the shallow alkaline water to the bottom. A remarkable lake of this class is sometimes formed in the northern part of the Black Rock Desert, in Nevada, during extremely wet seasons. Its water is furnished mainly

by Quinn River, and it has been known to have a length of 50 or 60 miles, with a breadth of 20. During the summer it disappears entirely, leaving an absolutely barren plain of mud, Quinn River at the same time shrinking back a hundred miles towards its source. The peculiar history of playas and playa-lakes will be more fully described in connection with the physiography of the Lahontan basin, which is the subject of Chapter III.

A few lakes situated on the borders of the Great Basin have outlets, and discharge their surplus waters into reservoirs at lower levels within the area of interior drainage. These are of the same type as the ordinary lakes of humid climates, with waters as pure and fresh as springs and melting snow can furnish. Their finest example, Lake Tahoe, lies just within the western rim of the Great Basin, at an elevation of 6,247 feet, amid the peaks of the Sierra Nevada. Its outlet, the Truckee River, flows downward with a descent of 2,400 feet to Pyramid and Winnemucca lakes, where the water is evaporated, leaving the lower lakes charged with soda salts. Just within the eastern border of the Great Basin lie Bear Lake and Utah Lake, the former discharging its waters through the Bear River and the latter through the Jordan River to Great Salt Lake. These streams carry down from the mountains their small percentages of saline matter, as a contribution to the already saturated solution of the inland sea where their waters are evaporated.

It may be taken as a rule that all lakes which overflow are fresh, and all lakes which do not find outlet become in time charged with mineral salts. River water is never absolutely pure, but contains a small percentage of mineral matter, which is left behind when the water is evaporated. Should this process continue long enough it is evident that a lake without an outlet would in time become a saturated solution, from which the less soluble mineral salts would begin to crystallize.

The examination of those inclosed lakes of the Great Basin that are comparatively fresh, and especially of the lakes occupying the Lahontan basin, shows that salt lakes may in some instances become essentially fresh without overflowing. It has been suggested by Mr. G. K. Gilbert, in explanation of this apparent anomaly, that a lake may evaporate to dryness and its salts become buried beneath the deposits of playa-lakes, so that on the

return of humid conditions the water that reoccupies the old basin may be comparatively, if not absolutely, fresh.

To the artist the scenery of the arid lands of the Far West contrasts with that of more humid regions by the russet-brown desolation of the valleys, the brilliant colors of the naked rocks, and the sharp, angular outlines of the mountains. A country without water is necessarily a desert, while with abundant moisture, at least in tropical and temperate latitudes, it becomes a garden of luxuriant vegetation. In the most desert portions of the Great Basin the annual precipitation does not exceed four inches, while in the valleys on the borders of the basin it probably reaches 20 or 30 inches. Throughout this region the only fruitful areas are along the margins of streams, or where springs come to the surface. In such places, where water can be had for irrigation, one finds oases of delicious shade, with green fields and orchards yielding an unusually abundant harvest. Thus in nearly all its physical features the Great Basin stands in marked contrast with those favored lands where rain is more abundant and more evenly distributed.

The rainfall that a region receives is a potent though silent factor, which controls an almost infinite series of results in its physical history and topography. In a humid region vegetation is usually luxuriant; the rock forms are masked by forests, erosion is rapid, and the rocks are commonly buried beneath the accumulations of their own *débris* or concealed by layers of vegetable and animal mould that in turn are clothed with vegetation. The hills have flowing outlines and are dark with foliage. The valleys have gently sloping sides that conduct the drainage into streams meandering through broad plains, and the whole scene has the softness and beauty of a garden. In an arid land like the Great Basin all this is changed. The mountains are rugged and angular, usually unclothed by vegetation, and receive their color from the rocks of which they are composed. From the gorges and cañons sculptured in the mountain sides alluvial cones descend to the plain. These sometimes have an extent of several miles, and they are steep or gentle in slope according to the grade of the streams that formed them. The valleys, even more dreary than the mountains, are without arboreal vegetation and without streams, and form a picture of desolation

and solitude. In traveling through the Great Basin one sometimes rides a hundred miles without sight of a tree, and many times that distance without finding shade enough to protect him from the intense summer sun.

The bare mountains reveal their structure almost at a glance, and show distinctly the many varying tints of their naked rocks. Their richness of color is sometimes marvelous, especially when they are composed of the purple trachytes, the deep-colored rhyolites, and the many-hued volcanic tuffs¹ so common in western Nevada. Not unfrequently a range of volcanic mountains will exhibit as many brilliant tints as are assumed by the New England hills in autumn. On the desert valleys the scenery is monotonous in the extreme, yet has a desolate grandeur of its own, and at times, especially at sunrise and at sunset, great richness of color. At mid-day in summer the heat becomes intense, and the mirage gives strange delusive shapes to the landscape, and offers false promises of water and shade where the experienced traveler knows there is nothing but the glaring plain. When the sun is high in the cloudless heavens and one is far out on the desert at a distance from rocks and trees, there is a lack of shadow and an absence of relief in the landscape that make the distance deceptive—the mountains appearing near at hand instead of leagues away—and cause one to fancy that there is no single source of light, but that the distant ranges and the desert surfaces are self-luminous. The glare of the noonday sun conceals rather than reveals the grandeur of this rugged land, but in the early morning and the near sunset the slanting light brings out mountain range after mountain range in bold relief, and reveals a world of sublimity. As the sun sinks behind the western peaks and the shades of evening grow deeper and deeper on the mountains, every ravine and cañon becomes a fathomless abyss of purple haze, shrouding the bases of gorgeous towers and battlements that seem incrustated with a mosaic more brilliant and intricate than the work of the Venetian artists. As the light fades and the twilight deepens, the mountains lose their detail and become sharply outlined silhouettes, drawn in the deepest and richest purple against a brilliant sky.

¹The word *tufa* is used throughout this volume to designate deposits of calcium carbonate. When the volcanic product is meant, for which the same name is sometimes used, we shall designate it by the word *tuff*.

The succession of seasons is less plainly marked on the deserts of the Great Basin than on the forest-covered hills of the Atlantic slope. As autumn advances, but little change appears in the color of the landscape, excepting, perhaps, a spot here and there of gold or carmine high up on the mountains, where a clump of aspens or of dwarfed oaks marks the site of a spring that trickles down and loses itself among the rocks. The valleys with their scanty growth of sage remain unchanged, as do the dusky bands of pines and cedars on the higher mountains. As the autumn passes away, the skies lose their intense blue, and become more soft and watery, more like the skies of Italy. The hues of sunset appear richer and more varied, and during the day cloud masses trace moving lines of shadow on the surface of the desert. By and by storm-clouds gather in black, gloomy masses that envelop the ranges from base to summit. These early storm-clouds cling close to the mountains and yield to the parched deserts but a few scattered drops of rain. The observer from below hears the raging tempest amid the veiled peaks, while all about him is sunshine. The mountains wrapped in impenetrable clouds, the glare of lightning and the deep roll of thunder as it echoes from cliff to cliff and from range to range, bring to mind the scriptural account of the storms of Sinai. And when the black clouds at last roll back from the mountains, and the sun with a wand of light dispels the storm, behold what a transfiguration! The peaks are no longer dark and somber, but glitter with the silvery sheen of freshly fallen snow.

As winter approaches, the storms amid the uplands become more frequent, until every range is white as snow can make it, and the tent-like mountains gleam like the encampment of some mighty host. Long after they are covered, the valleys between are bare as in midsummer, and the snow seldom lies upon them for more than a few days at a time. The highlands retain their snow far into summer, but on none of the ranges can it be said to be perpetual. In the valleys there are flowers beneath the sage-brush by the middle of April, but from that time until November scarcely a drop of rain falls. For many days and sometimes for weeks the skies are without a cloud.

The agriculture of this arid region is restricted to those scanty areas of land that can be irrigated. Of more importance is the grazing of sheep and cattle on the bunch-grass that frequently abounds amid the mountains and sometimes grows beneath the sage-brush. The mines of the precious metals, however, are the principal source of wealth, and to them must now be added a growing industry in salt, borax, sulphur, and carbonate of soda.

The Great Basin is not attractive to the pleasure-seeker, but to the geologist it is peculiarly fascinating, both because the absence of vegetation gives such unusual facilities for investigation, and because of the character of the problems to be solved. It is in this inhospitable region, now so arid that many a lost traveler has perished from thirst, that the great lake existed in recent geological time, which has been made a subject of study by the writer and his associates, the results of which are now presented.

EXPLORATIONS.

The existence of a great area of interior drainage on this continent, similar in many ways to the desert region of southern Asia, was not known, except to the early Spanish missionaries, among whom the name of Father Escalante is most prominent, and to trappers and hunters, who left no records of their observation, until Capt. B. L. E. Bonneville reached its eastern border in 1832.² A year later, a party led by Joseph Walker traveled across to the Pacific coast, by way of the Humboldt River and the Carson Desert. This expedition returned by a more southern route, and determined that much of the country explored did not drain to the ocean.

Ten years later, J. C. Fremont, then a lieutenant in the Army, carried his bold explorations into the same region, and gave the name of "The Great Basin" to the rugged and arid country which he traversed westward of the Rocky Mountains. A comprehensive, and, for the most part, an accurate, description of the general features of the Great Basin, was published by Fremont in his report of 1848;³ a detailed narrative of his journeys in 1842, '43, and '44 having been published three years previously.⁴

² Adventures of Captain Bonneville, by Washington Irving.

³ Geographical Memoir upon Upper California, Washington, D. C., 1848, p. 7.

⁴ Exploring Expedition to the Rocky Mountains. Washington, 1845.

A summary of the results of exploration in this region previous to 1857 was prepared by Lieut. G. K. Warren, and published in Volume XI of the Reports of the Pacific Railroad Explorations, to which we must refer the reader for detailed information in this connection.

A portion of the region of interior drainage is within the boundaries of California, and came within the limits of the explorations of the geological survey of that State, carried on under the direction of Prof. J. D. Whitney. Volume I of the reports of that survey contains a brief account of the Great Basin,⁵ relating principally to its southern border, which was compiled from the notes of several travelers.

Since the completion of railroad communication with the Pacific coast in 1869, important advances have been made in our knowledge of the Great Basin. The Central and Southern Pacific railroads have crossed it and sent numerous branches through its desert valleys, both northward and southward from the trunk lines; many towns and mining camps have sprung up along these highways, and almost every foot of easily irrigable land has been appropriated by settlers. Herds of cattle and sheep find subsistence on the mountains and in the sage-brush-covered valleys which were once thought to be too barren to become of service to man. Some of the most productive silver mines in the world have been developed in this inhospitable region. Throughout the eastern border of the Great Basin, in Idaho, Utah, and Arizona, the followers of the Mormon faith have found a "promised land," which by untiring toil and industry they have reclaimed from its primitive desolation and made the home of thousands. With all this advancement, however, the Great Basin is but thinly settled, when we consider its vast area; but, owing to its desert nature, probably contains a larger population than its agriculture alone can sustain. Together with the settlement of the country, exploration has gone forward until but little of the great *terra incognita* of thirty years ago remains unmapped; scarcely more than a beginning has been made, however, in unraveling its complicated geological history. The United States Geological Exploration of the Fortieth Parallel, in charge of Clarence King, mapped the geology of a belt 100 miles wide across its northern portion. A large part of the Great

⁵Page 461.

Basin was also mapped by the surveys in charge of Capt. George M. Wheeler and Major J. W. Powell; and geological explorations have been carried over large areas by the geologists connected with these surveys. The present Geological Survey has made special studies of a few of the principal mining centers of the Great Basin, and commenced the investigation of its surface geology in a systematic manner. Even with such a favorable beginning, many years of patient investigation, accompanied at times with hardships and privations, will be required before the geology of the Great Basin can be fully written.

The exploration of the Lahontan basin, so far as is definitely recorded, began in 1833, when it was crossed by the party in charge of Joseph Walker, as previously mentioned.* No report of this journey has been published excepting in Irving's attractive book describing the adventures of Captain Bonneville. In 1843, '44, '45, and '46, Fremont traversed the Lahontan basin throughout nearly its entire extent from north to south and made many geographical discoveries; but although he noted the presence of tufa deposits about Pyramid Lake, and published a sketch of the tufa-coated island which suggested its name, he does not seem to have recognized that his route led through the desiccated bed of an ancient inland sea.

In 1854, Capt. E. G. Beckwith⁶ crossed the northern part of the Lahontan basin, in the region of the Black Rock and Smoke Creek deserts, but gave little attention to the geology of the country traversed; the main object of his exploration being the discovery of a practical railroad route to California. Other reports of a similar nature might be cited, as that of Capt. R. Ingalls,⁷ who traversed the Lahontan basin in the latitude of the Carson Desert in 1855; little information of geological importance is contained, however, in the narratives of these earlier expeditions.

The exploring party in command of Capt. J. H. Simpson⁸ entered the Lahontan basin at Sand Spring Pass, at the eastern end of Alkali Valley, in June, 1859, and encamped on the slough connecting North and South Carson lakes; the expedition then proceeded southward to Walker Lake, by

⁸Explorations Across the Great Basin of Utah, Washington, D. C., 1876, pp. 312, 313.

way of Allen's Springs, and afterwards traversed Mason and Carson valleys, which, as we now know, were also occupied by the waters of Lake Lahontan. The presence of ancient water lines and of calcareous tufa deposits about the borders of the Carson Desert was recorded by Henry Engelmann, the geologist of the expedition, in his report on the geology of the country traversed during the reconnaissance, but time did not permit an extended study of the surface geology of the region. That large portions of the area of interior drainage had at no distant time been occupied by lakes was clearly recognized, and the cause of their disappearance was correctly ascribed to climatic changes.

During the progress of the United States Geographical Surveys west of the 100th Meridian, in charge of Capt. George M. Wheeler, large portions of the Lahontan basin were topographically surveyed, but no report on the geography or geology of the region has been published. The maps prepared by this survey, and also those issued in connection with the exploration of the Fortieth Parallel, were exceedingly useful during the field work of the present investigation, and were freely used in compiling the pocket map accompanying this report, as well as in preparing some of the smaller illustrations.

The exploration of the Fortieth Parallel included a belt 100 miles wide which crossed the Lahontan basin, but left considerable areas both to the north and south unmapped. In the reports of that survey Lake Lahontan received its name, and it is discussed to considerable length by the geologist in charge (Vol. I). Many detailed observations relating to the history of the former lake were recorded by Messrs. Arnold Hague and S. F. Emmons as a part of their report (Vol. II) of field observations. It is not necessary to introduce an abstract of the results reached by these geologists in reference to the history of the former lake, as we shall have frequent occasion to refer to their work in the pages that follow.

In 1872 Dr. James Blake made a journey from Winnemucca, Nevada, to the Pueblo Mountains, Oregon, during which he traversed the northern portion of the Lahontan basin, and made many observations in reference to tufa deposits, terraces, fossil shells, etc. The results of these observations were published in two brief papers in Vol. IV (1872) of the Proceedings

of the California Academy of Sciences.⁹ In these papers the possibility of an outlet to the ocean for the waters of the Great Basin during the Quaternary is suggested, and measurements are given of the altitude of some of the passes in the northern part of Nevada which lead towards the drainage of the Columbia. That the passes in this region could not have furnished a point of discharge for Lake Lahontan will be shown in the following chapter (page 34).

The study of the surface geology of the Great Basin, undertaken by the United States Geological Survey, was begun in the summer of 1880; a section of the survey, entitled the "Division of the Great Basin," having previously been organized under the leadership of Mr. G. K. Gilbert, with headquarters at Salt Lake City, Utah. The first field season was occupied with the study of Lake Bonneville, the results of which have been published by Mr. Gilbert in a somewhat popular essay in the second annual report of the survey; the final report, in the form of an independent monograph, is now in preparation.

In April, 1881, the writer commenced a geological reconnaissance through the northern part of the Great Basin, during which the northern half of Nevada was crossed and recrossed, and excursions were made into eastern California and southern Oregon. As the first year's exploration was entirely of a preliminary character, without scientific assistants, all detailed study and instrumental work was deferred until the following season. The reconnaissance of 1881 occupied seven months, during which about 3,500 miles were traversed in the saddle, the route being planned with special reference to the study of Quaternary geology. During the season the basin of Lake Lahontan was crossed in various directions and much of its history was deciphered. A sketch of the geology of Lake Lahontan, so far as determined from the first season's explorations, was published in the Third Annual Report of the United States Geological Survey.

While carrying forward the reconnaissance of 1881, the Mono basin, California, was visited and the study of its geological history begun; this task was left unfinished, however, until the region could be topograph-

⁹On the absence of a rim to the Great Basin to the west of Pueblo Butte, p. 223. Remarks on the Topography of the Great Basin, pp. 276-278.

ically surveyed. From the experience gained during the first season's work, a plan of investigation was developed which was carried out during the summers of 1882 and 1883.

On taking the field at Winnemucca, Nevada, in the spring of 1882, I was joined by Mr. Willard D. Johnson, of Washington, D. C., who accompanied me on a journey through that portion of the Great Basin that lies north of the hydrographic rim of Lake Lahontan and is situated mostly in Oregon. The results of this exploration, so far as the surface geology of the region is concerned, were published in the Fourth Annual Report of the United States Geological survey. During this reconnaissance the previous conclusion that Lake Lahontan did not overflow northward was fully confirmed. The Great Basin north of the Nevada-Oregon boundary, in common with the main area of interior drainage, is divided into a number of independent hydrographic basins, many of which held Quaternary lakes that must have been contemporaneous with the great lakes of Utah and Nevada.

On returning to Winnemucca in July, I was joined by Mr. W J McGee as geological aid, and a few weeks later by Mr. George M. Wright, also in the same capacity. Proceeding southward from Winnemucca we examined the Lahontan sediments, terraces, tufa deposits, etc., occurring in the Humboldt Valley, and then continued our journey southward in order to study the region about Humbolt, Pyramid, Winnemucca, and Walker lakes. Later in the season we entered the Mono Lake basin and began a detailed investigation of its Quaternary geology. Owing to the advance of winter we were obliged to leave the completion of this work until another season.

During the time that the expeditions mentioned above were being carried forward, Mr. A. L. Webster, assisted by Mr. Eugene Ricksecker, was engaged in making a topographical survey of the northeast portion of the Lahontan basin, in order to complete the compilation of the accompanying pocket map. The region surveyed by Mr. Webster embraced about 8,464 square miles, and is indicated on Plate II; the extreme eastern limit of the area surveyed is a few miles to the eastward of the right-hand border of the plate.

half season. From the experience gained during the first season's work, a plan of work for 1882 was developed which was carried out during the summer of 1882 and 1883.

On leaving the field at Winnemucca, Nevada, in the spring of 1882, I was joined by Mr. Willard D. Johnson, of Washington, D. C., who accompanied me on a journey through that portion of the Great Basin that lies west of the hydrographic rim of Lake Lahontan and is situated mostly in Oregon. The results of this expedition, so far as the surface geology of the region is concerned, were published in the Fourth Annual Report of the United States Geological Survey. During this reconnaissance the probability that the Lahontan did not overflow northward was fully established. The Great Basin north of the Nevada-Oregon boundary, in contrast with the rest of the interior drainage, is divided into a number of independent hydrographic basins, many of which held Quaternary lakes that must have been contemporaneous with the great lakes of Utah and Nevada.

On returning to Winnemucca in July, I was joined by Mr. W. J. McGee as geological aid, and a few weeks later by Mr. George M. Wright, also in the same capacity. Proceeding southward from Winnemucca we examined the Lahontan sediments, terraces, tufa deposits, etc., occurring in the Humboldt Valley, and then continued our journey southward in order to study the region about Humboldt, Pyramid, Winnemucca, and Walker lakes. Later in the season we entered the Mono Lake basin and began a detailed investigation of its Quaternary geology. Owing to the advance of winter we were obliged to leave the completion of this work until another season.

During the time that the expeditions mentioned above were being carried forward, Mr. A. L. Webster, assisted by Mr. Eugene Ricksecker, was engaged in making a topographical survey of the northeast portion of the Lahontan basin, in order to complete the compilation of the accompanying pocket map. The region surveyed by Mr. Webster embraced about 8,464 square miles, and is indicated on Plate II; the extreme eastern limit of the area surveyed is a few miles to the eastward of the right-hand border of the plate.

The various routes followed by myself and my scientific assistants during the exploration of Lake Lahontan are shown on Plate II, and will serve to indicate the degree of completeness to which we were enabled to carry our observations. A portion of the field season was devoted by Mr. Johnson to the preparation of local maps, the positions of which are also indicated on map forming Plate II.

The winter of 1882-'83 was passed at the survey office in Salt Lake City, in the preparation of notes and maps for publication, chemical studies connected with our work, etc. In July, 1883, I again took the field in company with Mr. Johnson, and recommenced work in the Mono basin. After devoting all the time practicable to the study of the Quaternary geology of that region I journeyed northward and passed through a large portion of the Lahontan basin, en route to Red Bluff, California, where I disbanded my party in October. In traversing the Lahontan basin I visited several points of interest in the Walker River cañon, about Pyramid and Winnemucca lakes, and on the Black Rock and Smoke Creek deserts, thus being able to review many previous observations.

Mr. Johnson completed his topographical survey of the Mono basin late in December, and brought to a close, at least for the present, the field study of the Quaternary geology of the region from which the Division of the Great Basin derived its name.

The explorations conducted by the writer have embraced three field seasons, a part of each having been devoted to the study of Lake Lahontan. The observations made during these several journeys, so far as they relate to the great Quaternary lake of northwestern Nevada, are included in the present report.

Our work in the Mono basin during the same years that the exploration of Lake Lahontan was being carried forward includes a study of the existing lake and of the ancient lake of much greater extent that formerly occupied the same valley; also, the relations of both the ancient and the modern lake to the glacial and volcanic phenomena displayed on a grand scale in the same basin. The results of these studies will be published in the Sixth Annual Report of the United States Geological Survey.

Incident to our geological studies in the Mono basin was a visit to the glaciers now existing amid the lofty peaks of the Sierra Nevada, on its western border. A sketch of the observations relating to these glaciers, together with a summary of what has been published in reference to these and other glaciers of the United States, was issued in the Fifth Annual Report of the United States Geological Survey.

CHAPTER II.

GENESIS OF LAKE LAHONTAN.

THE FORMATION OF LACUSTRAL BASINS.

The discussion of the origin of lake basins has been carried on with so much zeal during the past fifteen or twenty years that we now possess a large amount of literature bearing on the subject. From the facts gathered by many observers, in widely separated localities, it is evident that the depressions holding lakes are extremely diverse in character and have resulted from many causes. In some instances lakes are held in basins produced by orographic movement, *i. e.*, by the unequal folding of rocks, by dislocation due to faulting, etc. Others are the result of erosion, and have for their typical example a rock-basin produced by glacial action. Again, there is a third great group of basins produced by the damming of pre-existing waterways; as, for example, when the drainage of a valley is obstructed by moraines, land-slides, lava-flows, alluvial deposits, etc.

Following the schedule prepared by Davis,¹⁰ we have three broad classes of lake basins:

- a. Constructive or orographic basins.
- b. Destructive or erosion basins.
- c. Obstructive, barrier, or inclosure basins.

Each of these generic divisions is abundantly illustrated in the Great Basin. Very large portions, if not the entire area of interior drainage, have

¹⁰ Classification of Lake Basins, by W. M. Davis; Proceedings of the Boston Society of Natural History, Vol. XXI, 1882, p. 321.

been broken by a vast network of fractures accompanied by a tilting of the included blocks, which have given origin to orographic basins on a grand scale. On the borders of the region, in the glaciated valleys of the Sierra Nevada and Wasatch mountains, rock basins due directly to the erosion of glaciers may be counted by hundreds if not by thousands. From almost any of the peaks of the High Sierra more than a score of lakes of this character may be observed. Lakes occupying barrier basins are also numerous in the cañons of the Cordilleras where ancient moraines obstruct the drainage. A number of the Sierra Nevada lakes which owe their origin to erosion and decomposition, resulting mainly from glacial action, will be described in connection with the Quaternary history of the Mono basin in the Sixth Annual Report of the United States Geological Survey. At present we are constrained to confine our attention to the more central portion of the Great Basin. The area formerly occupied by glaciers in this region is very limited, and as flowing ice has been the principal agent in the formation of basins of erosion, this type of lake-basin is wanting, except about the summits of some of the highest of the basin ranges. Barrier basins, produced by the deposition of the current-borne *débris* of ancient lakes in such a manner as to obstruct the drainage of valleys, are not uncommon in the interior portion of the Great Basin, but the depressions characteristic of the region are due to other causes.

ORIGIN OF THE LAHONTAN BASIN.

The more pronounced topographic features of the Great Basin have been found to be the result of orographic displacement. The typical mountain structure of the region is monoclinal; the elements being orographic blocks bounded by faults, and so tilted that their upturned edges form mountain crests with a steep descent on one side and a more gentle slope in the opposite direction. The upheaved edges of faulted blocks usually appear as long and narrow ranges. Their depressed borders under-

lie valleys. An ideal cross-section of the mountains and valleys of the Great Basin is shown in the following diagram:

FIG. 1.—Ideal section illustrating Great Basin structure.

The structure here illustrated has been found so typical of the region between the Sierra Nevada and the Rocky Mountains, that it has been named by Gilbert the "Great Basin system" of mountain structure.¹¹

The grandest displacements of the Great Basin are those determining its eastern and western borders, *i. e.*, the Wasatch and the Sierra Nevada faults. The first has been described by King, Gilbert, and others, and has been traced by the writer continuously for more than 150 miles; the second has been studied at intervals for over 200 miles without determining its full extent. The Sierra Nevada fault is much less regular in its course, and is more complex than the corresponding displacement along the eastern border of the Great Basin. It is conspicuous in Honey Lake Valley, California, where its scarp forms a line of rugged cliffs, bordering the plain on the west; and again along the west side of Eagle and Carson valleys, from near Carson City southward for fifty miles or more. In the valley of Mono Lake it is strongly pronounced; farther southward, in Owen's Valley, it has again been recognized, but its southern, like its northern terminus, is at present unknown. The details of this profound fracture are far from being understood, as it branches and changes its course in an extremely irregular manner. Disregarding all minor displacements, as well as the results of erosion and sedimentation, we may consider the Sierra Nevada in a general way as the upraised edge of an orographic block, having its eastern border determined by the great fault we have noticed above. The desert region stretching eastward from the base of the mountains is the thrown side of the same displacement. It is on the depressed side of this fault that the Lahontan basin is situated.

¹¹ U. S. Geographical Surveys West of the 100th Meridian, Vol. III, p. 21.

It is not to be understood, however, that the old lake basin was formed by a single, simple displacement; on the contrary, it is the result of exceedingly complex faulting that affected the entire region included between the Wasatch and the Sierra Nevada mountains. The time when these movements began is unknown, but they antedate the Quaternary, were in process during the existence of lakes Bonneville and Lahontan, and probably have not yet ceased, as will be shown in Chapter X. The old lake basin, instead of being a simple orographic valley, is composed of a large number of separate and independent depressions of the Great Basin type, which are united with one another directly, or by the intervention of narrow passes, and so nearly coincident in level that a single lake 900 feet deep in the lowest depression could flood them all. It is to the union of these various, independent, monoclinical valleys that the extremely irregular outline of Lake Lahontan is due.

Nearly all the ranges of northwestern Nevada are rugged and form serrate crests having an approximately north and south trend, and, as already stated, as a nearly universal rule they are monoclinical. An older structure, however, as first recognized by King,¹² is frequently apparent, in which a folding of the rocks into anticlinal and synclinal may be traced. In the older deformation the rocks were crumpled and contorted as in the Alleghanies and the Alps, but during the later disturbances they were broken without being folded. The monoclinical blocks resulting from the second disturbance are the elements giving character to the present topography; the surface features due to the former structure having been rendered inconspicuous by the later movements. The trend of the fault lines, and consequently of the mountain axes, is in general nearly north and south, but in the central part of the Great Basin, north of latitude 37° , it is more nearly north-northeast and south-southwest.

At present we can only call attention to a few characteristic examples of the displacements that gave origin to the Lahontan basin; these may be taken as types of the prevailing structure of the region.

In the Santa Rosa Mountains, in northern Nevada, the fault determining the trend of the range follows its western base and has a throw of not less

¹² U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 735.

than 5,000 or 6,000 feet. The eastern slope is comparatively gentle, and conforms in a general way with the inclination of the beds of volcanic rock composing a large part of the mountains. The bold western mountain face is in reality an eroded fault scarp; the thrown block underlies Quinn River Valley.

In the case of the Jackson Range the principal fault follows its western base; the eastern base of the Pine Forest Mountains is also a precipitous fault scarp; the Black Rock Desert, intervening between these ranges, is a depressed area, which has been deeply buried beneath the sediments of Lake Lahontan. An ideal section from east to west, through these ranges, is shown in the following diagram:

FIG. 2.—Ideal section through the Black Rock Desert, Nevada.

The Pahute Range, on the eastern border of the Carson Desert, has a well defined line of displacement along both the eastern and the western base, as indicated in the following generalized section:

FIG. 3.—Ideal section of the Pahute Range, Nevada.

Great faults may also be traced along the western bases of the West Humboldt and Star Peak ranges. The eastern shores of both Pyramid and Winnemucca lakes are likewise determined by fault scarps, as indicated below.

FIG. 4.—Ideal section through Pyramid and Winnemucca lakes, Nevada.

In Walker Lake Valley the orographic structure so typical of the Great Basin is again repeated; the main displacement in this instance follows the western border of the valley and determines the abrupt eastern face of the Wassuck Mountains. The topography of the valley is well shown on Plate XV.

If desirable, illustrations of Basin Range structure might be multiplied almost without number, not only in the Lahontan basin, but throughout Nevada, Utah, and Arizona, and in parts of Oregon and California. On the accompanying map, Plate III, an attempt is made to represent the course of the faults that determined the main features in the present topography of the Lahontan basin. The data for completing a map of this nature, however, so as to present an accurate outline of the orography of the region, have not been obtained, for the reason that special attention has not been directed to the subject. The lines of displacement that are shown have been sketched from actual observation, and serve, at least in the absence of more complete data, to indicate the vastness of the system of fractures that have given diversity to the topography of the region. Could every fault be indicated the map would be covered by an irregular network of intersecting lines.

The depression formerly occupied by Lake Lahontan may be taken as the type of a compound rock-basin due to displacement, many of the minor valleys of which it is composed being examples of fault-basins of the simplest kind.

GEOGRAPHICAL EXTENT.

THE HYDROGRAPHIC BASIN.

During the Quaternary period, as at the present time, the region of interior drainage between the Sierra Nevada and the Wasatch mountains was divided into a large number of interior drainage areas or hydrographic basins, two of which were of large size, and have claimed special attention. These are included between the 38th and 42d parallels of latitude, and together occupy the entire breadth of the Great Basin. The one to the eastward embraced northern and western Utah, together with small portions of Idaho and Wyoming, and delivered its drainage to Lake Bonneville. The hydrographic area to the westward included the northwestern part of Nevada, together with small portions of California and Oregon, and discharged into Lake Lahontan. Lake Bonneville received the drainage from

PRE-QUATERNARY FAULT LINES

44-1000000 HISTORY OF LAKE LAHONTAN.

The extension of Basin Range structure might be multiplied many times, not only in the Lahontan basin, but throughout Nevada, Idaho, and Utah, and in parts of Oregon and California. On the map of the region, Plate III, an attempt is made to represent the course of the faults that formed the main features in the present topography of the region. The data for completing a map of this nature, however, is wanting to give an accurate outline of the orography of the region, and for the reason that special attention has not been given to the subject. The lines of displacement that are shown have been drawn from a general observation, and serve, at least in the absence of more detailed data, to indicate the vastness of the system of fractures that have shaped the topography of the region. Could every fracture in the region be covered by an irregular network of faults, the topography would be covered by an irregular network of faults.

The topography occupied by Lake Lahontan may be taken as typical of the topography of the basin due to displacement, many of the minor basins of the region being examples of fault-basins of the simplest type.

HYDROGRAPHICAL EXTENT.

THE HYDROGRAPHIC BASIN.

During the Pleistocene period, as at the present time, the region of the Great Basin between the Sierra Nevada and the Wasatch mountains was divided into a large number of interior drainage areas or hydrographic basins, many of which were of large size, and have claimed special attention. These are included between the 38th and 42d parallels of latitude, and together occupy the entire breadth of the Great Basin. The one to the eastward embraced northern and western Utah, together with small portions of Idaho and Wyoming, and delivered its drainage to Lake Bonneville. The hydrographic area to the westward included the northwestern part of Nevada, together with small portions of California and Oregon, and discharged into Lake Lahontan. Lake Bonneville received the drainage from

Julius Bien & Co. Lith.

PRE - QUATERNARY FAULT LINES.

Scale, 29 miles = 1 inch

a surface 52,000 square miles in extent; Lake Lahontan's hydrographic basin embraced 40,775 square miles.

The Bonneville basin has its lowest depression along its eastern border, now occupied by Great Salt Lake; and its form was largely determined by the Wasatch fault. In the Lahontan area the lowest depression is situated near the base of the Sierra Nevada, and the topography of the basin is determined, to a considerable extent, by the fault which follows the eastern base of that range.

The Bonneville and Lahontan drainage areas had a common divide for about 25 miles, between the 41st and 42d parallels, and a little east of the 115th meridian. Southward of the 41st parallel the boundaries of the two great hydrographic areas diverge, the included space being divided by short mountain ranges into a number of independent basins, some of which held Quaternary lakes of considerable size.

The direction of the streams in the northern part of the Great Basin shows that the area is divided by a central axis, irregular in its trend, from which the surface has a general slope, both eastward and westward, to the bases of the inclosing mountains.

From the Bonneville-Lahontan divide, north of Toano, the Humboldt River flows westward through a narrow and rugged valley which crosses the structural features of the country nearly at right angles. The course of the river seems to have been determined in Tertiary times, or perhaps earlier. During the Quaternary the Upper Humboldt Valley was occupied by a stream larger than the present, which emptied into Lake Lahontan a few miles east of the present site of Golconda. Before reaching the lake, the Quaternary river received considerable additions from the north through the channels of the North Fork, Maggi, Rock, and Rabbit creeks, and the Little Humboldt River. Its most important tributary, however, in ancient as in modern times, came from the southward, and flowed through the narrow Reese River Valley.

On the north the Lahontan drainage area was bordered by the rim of the Great Basin, and by a number of small and independent areas of interior drainage, situated mostly in Oregon and in the northwestern corner of Nevada. On the west the divide coincided for not less than 260 miles with

the western rim of the Great Basin, and was determined by the crest line of the Sierra Nevada, from the eastern slope of which the lake received its greatest tribute. The Walker, Carson, and Truckee rivers gathered the surface drainage of the mountains into previously excavated channels, which bear witness to a long period of erosion antecedent to the existence of the Quaternary lake. The divide between the waters that flowed into Lake Lahontan and the drainage of the interior basins bordering it on the south and east is extremely irregular, but is well defined throughout the greater part of its course by the crests of rugged mountains.

The separate drainage systems into which the basin is divided are the Humboldt and Reese river valleys of the east, Quinn River on the north, the Walker, Carson, and Truckee rivers, together with Smoke and Buffalo creeks, and Snowstorm and High-Rock cañons on the west. The boundary of the region that drained into Lake Lahontan is shown on Plate IV. Besides the areas draining into living streams there are several desert basins within the Lahontan area, as represented on Plate XXIX.

One of the most important conclusions to be derived from a study of the drainage in the region of Lake Lahontan during the Quaternary period is that the country at that time had about its present topographic form. The mountains were then the same as we find to-day, excepting that the lines carved by subaerial erosions are a little deeper, the alluvial cones about their bases are slightly larger, and they have undergone very moderate post-Quaternary orographic movements. The cañons occupied by the tributaries of Lake Lahontan still afford drainage channels when there is sufficient precipitation to form streams. If Quaternary man could revisit his ancient hunting grounds, he would have no difficulty in recognizing the landmarks that were once familiar to him. The mountains and valleys are the same, although their scanty vegetation has probably undergone many changes. The great lakes which were familiar to him, however, have passed away and given place to broad silent plains of desolation. The former rivers have shrunk, and many of their channels are dry.

THE LAKE BASIN.

As may be learned from the accompanying map, Plate IV, the outline of the hydrographic basin of Lake Lahontan is distinguished by great irregularity, and no less unsymmetrical is the contour line within, that marks the boundaries of the former lake. As nearly as can be estimated, the total area of Lake Lahontan, as previously stated, was about 8,422 square miles. Its northern extremity in Quinn River Valley reached a few miles north of the Nevada-Oregon boundary, and its extension southward was limited by the divide at the southern end of Walker Lake Valley. The distance between these points gives the extreme length of the lake as 250 miles. Its eastern limit was in Humboldt Valley, where the river passes through the Sonoma Range, a few miles to the eastward of Golconda; and the most westerly point near Susanville, in Honey Lake Valley, California. The axis joining these two extremes is 180 miles in length.

The area inclosed by the Lahontan beach is traversed by many mountain ranges, which formed peninsulas and islands during the existence of the lake, and divided its surface into a number of irregular water bodies that were connected by narrow channels. The principal water surfaces were grouped in two rudely parallel series, which were united at their northern and southern extremities by narrow straits. The area thus inclosed formed a large and extremely irregular island that bristled with barren and rugged mountain ranges. For convenience in description, we shall call the two main divisions of Lake Lahontan the Eastern and Western water bodies. The Eastern Body covered the Carson Desert, together with Buffalo, Alkali, and Churchill valleys, which open from it, extended up Humboldt Valley to beyond Golconda, and occupied the southern part of the Little Humboldt Valley. From the Humboldt the lake spread westward of the Eugene Mountains and the Slumbering Hills, and entirely filled Quinn River Valley.

The Western Body comprised the areas now known as the Black Rock and Smoke Creek deserts, together with the valleys of Honey, Pyramid, and Winnemucca lakes. At the north the connection between these two main divisions was by a narrow strait now traversed by the lower part of Quinn

River. The water in this channel during the highest stage of Lake Lahontan was 350 to 380 feet deep. The equally narrow strait connecting the East and West bodies at the south is now occupied by the lower portion of the Truckee River in its course between Wadsworth and Pyramid Lake.

On Plate V, the depth of the water during the highest stage of Lake Lahontan is given in feet. These determinations are mostly from aneroid measurements, and show the lake to have been about 500 feet deep over the Carson Desert, becoming shallow in its extension up the Humboldt Valley. On the Black Rock and Smoke Creek deserts the depth was from 500 to 524 feet. The deepest sounding in the old lake, however, as already stated, was at the present site of Pyramid Lake, where the depth was 886 feet.

While the various valleys composing the basin of Lake Lahontan are orographic in their character, the cañons of inflowing streams are largely due to erosion. All the rivers, as well as the smaller creeks that were tributary to the lake, flowed in deeply cut cañons, many of which were occupied for a long distance by the waters of the lake when it reached its maximum extent. These cañons will be more fully noticed in connection with the description of the Lahontan lake beds.

Lahontan was intermediate in area between Lake Erie and Lake Ontario, but was far less systematic in outline than either; in fact its boundaries were more irregular than any other lake, recent or fossil, that has been explored. As shown on the frontispiece, it was smaller than Lake Bonneville, and ranks as second in size of the Quaternary lakes of the Great Basin.

QUESTION OF OUTLET.

In studying the records of an ancient lake, one of the first questions to which it is desirable to find an answer is whether it overflowed or not; and if it did find an outlet, what are the characteristics of the channel of discharge. The importance of determining the nature of the channel of overflow of a fossil lake is illustrated in the case of Lake Bonneville, which, as is well known from Mr. Gilbert's investigations, rose until it overflowed at Red-Rock

DEPTH OF LAKE LARONTAN AT HIGHEST WATER STAGE.
Soundings given in feet.

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

The water in this channel during the highest stage of Lake Lahontan was about 350 feet deep. The equally narrow strait connecting the East and West bodies of the lake south is now occupied by the lower portion of the Humboldt River in its course between Wadsworth and Pyramid Lake.

On Plate V, the depth of the water during the highest stage of Lake Lahontan is given in feet. These determinations are mostly from aneroid measurements and show the lake to have been about 500 feet deep over the Carson Desert, becoming shallow in its extension up the Humboldt Valley. In the Black Rock and Smoke Creek deserts the depth was from 100 to 200 feet. The deepest sounding in the old lake, however, as already stated, was at the present site of Pyramid Lake, where the depth was 886 feet.

Among the various valleys composing the basin of Lake Lahontan are many of the canyons of inflowing streams are largely due to erosion. All the rivers, as well as the smaller creeks that were tributary to the lake, have deeply cut canyons, many of which were occupied for a long time by the waters of the lake when it reached its maximum extent. These canyons will be more fully noticed in connection with the description of the Lahontan lake beds.

Lahontan was intermediate in area between Lake Erie and Lake Ontario, but was far less symmetrical in outline than either; in fact its boundaries were more irregular than any other lake, recent or fossil, that has been explored. As shown on the frontispiece, it was smaller than Lake Michigan, and ranks as second in size of the Quaternary lakes of the Great Basin.

QUESTION OF OUTLET.

In studying the records of an ancient lake, one of the first questions to which it is desirable to find an answer is whether it overflowed or not; and if it did find an outlet, what are the characteristics of the channel of discharge. The importance of determining the nature of the channel of overflow of a fossil lake is illustrated in the case of Lake Bonneville, which, as is well known from Mr. Gilbert's investigations, rose until it overflowed at Red-Rock

Julius Bien & Co. Lith.

Pass, in Idaho, and then cut down its outlet to the depth of 370 feet. The level of the first point of discharge determined the horizon of the highest of the Bonneville terraces. The bottom of the gorge cut by the overflowing stream determined the level of the Provo Beach, the most strongly accented of all the Bonneville water lines.

As previous writers on Lake Lahontan have conjectured that there was an outlet at its southern end¹³ this was the first portion to be explored when the present study was undertaken. On examining Gabb's Valley, it was found that a mountain barrier intervened between it and the Lahontan basin to the northwest, thus proving that it was not occupied by that lake, and, moreover, was not included in its hydrographic basin. From the southern end of the Carson Desert a long narrow arm of the former lake extended into the desert valley which opens southward from Allen's Springs. The southern end of this valley is low and filled with alluvium which has been formed into gravel bars by the waters of Lake Lahontan; these sweep about the end of the basin in graceful curves, the highest in the series coinciding with the horizon of the highest water level of Lake Lahontan, thus proving conclusively that the lake did not here find an outlet.

The highest of the Lahontan beaches at the eastern end of Alkali Valley is far below the lowest part of Sand Spring Pass, which proves that Lahontan did not enter Fairview Valley through this gap.

The Lahontan beach may be traced with ease along the steep volcanic bluffs bordering the Carson Desert on the south, from Allen's Spring, to where the Carson River breaks through the range. The lake extended through the Carson River cañon and occupied Churchill Valley and the valley of the Carson River as far as Dayton. Opposite Old Camp Churchill there is a narrow gap in the hills bordering the valley on the south, which at first gives promise of having been an outlet of the ancient lake. On following up this valley we find it ascending with a low grade and opening through a narrow gap into Mason Valley, about which there are beach lines, showing that it too was once filled by a lake. The highest beach in Mason Valley is on a level with the top of a narrow divide which has been

¹³King: U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 507. Whitney: Climatic Changes in Later Geological Time, p. 110. Memoirs of the Museum of Comparative Zoology of Harvard College, Vol. VII, No. 2.

cut through by a stream that once flowed into Lahontan basin through the channel that opens opposite Old Camp Churchill. The lake which occupied Mason and Walker Lake valleys cut down its point of overflow about 85 feet, and discharged its waters northward. The bottom of the channel, thus formed, where it leaves Mason Valley is between 60 and 70 feet below the level of the Lahontan beach, as determined by measurements of level connected with the profile of the Carson and Colorado Railroad. These measurements indicate that Lake Lahontan did not extend into Mason Valley until after the channel cut by the overflow from that basin was formed. We know, however, that there has been considerable post Lahontan orographic movement in this region, and it seems not unlikely that the relative height of Mason Valley and the Lahontan beach along the Carson River, may have been changed since the evaporation of the former lake. It is, therefore, possible that Lahontan during its highest stage extended through the pass connecting Churchill and Mason valleys, before the present channel was excavated, and occupied Mason and Walker Lake valleys. The tufa deposits about Walker Lake, as will be explained in a future chapter, are of the same nature as the similar formations in the main areas of Lake Lahontan, and indicate that they were precipitated from waters of the same character.

After determining that Lake Lahontan did occupy Walker Lake Valley, we explored its ancient beaches, and found that the former lake extended only a few miles southward of the one which now fills the bottom of the basin. Well preserved gravel bars sweep around the southern end of the valley but do not reach the level of the pass leading south into Soda Springs Valley; at the end of this basin there is also a low pass that is uncut by stream erosion.

As the localities noticed above are the only ones on the southern border of the Lahontan basin that would suggest a possible outlet, the conclusion that the former lake did not overflow in that direction is positive.

In the northern part of the basin all the passes leading to the valleys draining into the Owyhee, one of the tributaries of the Columbia, were specially examined, as well as the divide between the northern end of the Black Rock Desert and Alvord Valley; at none of these places are there

channels of overflow. The divide at the northern end of the Black Rock Desert was the lowest point on the northern rim of the basin, but it was at least 200 feet above the Lahontan beach near at hand; moreover, the rim of the basin at this point was never cut by a transverse channel of erosion. This point was visited by Dr. James Blake in 1872, who determined its elevation to be "590 feet above the valley of Queen's [Quinn] River at the place where it makes a bend to the southwest, to lose itself in the Black Rock Desert."¹⁴ Lake Lahontan at the point in Quinn River Valley designated by Dr. Blake, was 380 feet deep, thus furnishing additional evidence that the ancient lake did not attain the level of the pass in question.

During the topographic survey of the northern portion of the Lahontan basin the highest water line of the old lake was mapped with care and found continuous throughout. The lake extended into King River Valley which formed a complete *cul de sac*, with no opening except into the Black Rock Desert. At the head of Quinn River the bottom of the valley slopes upward until at the divide it is several hundred feet above the horizon of the Lahontan beach. The northern border of Paradise Valley was closely examined by Mr. Webster, and gave positive evidence that it was not a point of discharge for the old lake. During the progress of our work every point on the northern rim of the basin that could be suspected of having been low enough to allow the old lake to overflow was examined either by the writer or his scientific assistants, and found to be unbroken by a channel of discharge such as an overflowing lake must necessarily excavate.

It is important to keep in mind the absence of an outlet while reading Lahontan history, as it has a direct bearing on the character of the shore topography which records the extent of the lake at various stages, and furnishes the key to the chemical history of the waters which formerly flooded the basin.

¹⁴Proceedings of California Academy of Sciences, Vol. IV, 1872, p. 276.

CHAPTER III.

PHYSIOGRAPHY OF THE LAHONTAN BASIN.

VALLEYS.

The region once occupied by Lake Lahontan is a typical portion of the great area of interior drainage of which it forms a part. The valleys throughout the region have an elevation of from 3,900 to 4,500 feet above the sea, and are approximately level plains that have been regions of accumulation for an indefinite period. Separating the valleys are rugged and angular mountain ranges rising from a few hundred to four or five thousand feet above the adjacent lowlands. The basin of the ancient lake, as well as the greater part of the region that drained into it, may with truth be called a desert country. The absolutely barren portions, however, with the exception of the mountain tops, are mostly confined to the Carson, Smoke Creek, and Black Rock deserts, which are completely destitute of vegetation over hundreds of square miles.

The smaller valleys, although mostly desolate and valueless for agriculture, are usually covered with a scattered growth of sage-brush and sometimes with other desert shrubs, and perhaps produce sufficient bunch-grass to form natural pastures. The soil throughout the valleys is usually more or less alkaline, but where water can be had for irrigation it is frequently found to be capable of producing good crops of grass and cereals.

The areas where irrigation has been successful are along the immediate banks of the Humboldt and Reese rivers, in the cañon of the Truckee, and narrow strips bordering the Carson and the Walker. Some portions of the

CHAPTER III.

PHYSIOGRAPHY OF THE LAHONTAN BASIN.

VALLEYS.

The region once occupied by Lake Lahontan is a typical portion of the great area of interior drainage of which it forms a part. The valleys throughout the region have an elevation of from 3,900 to 4,500 feet above the sea, and are approximately level plains that have been regions of accumulation for an indefinite period. Separating the valleys are rugged and angular mountain ranges rising from a few hundred to four or five thousand feet above the adjacent lowlands. The basin of the ancient lake, as well as the greater part of the region that drained into it, may with truth be called a desert country. The absolutely barren portions, however, with the exception of the mountain tops, are mostly confined to the Carson, Smoke Creek, and Black Rock deserts, which are completely destitute of vegetation over hundreds of square miles.

The smaller valleys, although mostly desolate and valueless for agriculture, are usually covered with a scattered growth of sage-brush and sometimes with other desert shrubs, and perhaps produce sufficient bunch-grass to form natural pastures. The soil throughout the valleys is usually more or less alkaline, but where water can be had for irrigation it is frequently found to be capable of producing good crops of grass and cereals.

The areas where irrigation has been successful are along the immediate banks of the Humboldt and Reese rivers, in the cañon of the Truckee, and narrow strips bordering the Carson and the Walker. Some portions of the

MAP SHOWING LAND CLASSIFICATION OF THE LAHONTAN REGION.

Carson Desert, so situated as to be conveniently watered from the Carson River, are also under irrigation. At a limited number of localities on the borders of the Black Rock Desert and in Quinn River Valley the water from springs and small mountain streams is used to irrigate gardens or a few acres of grain. In Mason and Honey Lake valleys there are swampy meadows of considerable extent adjoining irrigable lands where abundant harvests are annually secured.

The Central Pacific Railroad passes for 165 miles through the desiccated bed of the extinct lake, entering it a few miles east of Golconda and leaving it, on the west, in the Truckee Cañon about 15 miles west of Wadsworth. Nearly all the villages in the basin are located along this highway, which furnishes supplies for a wide extent of country. The traveler in crossing western Nevada by rail for the first time will perhaps be impressed with its barren nature and perhaps conclude that it is unfit for human habitation. With the exception of Mason and Honey Lake valleys, however, it is the most fruitful portion of the Lahontan basin. A typical example of the deserts of Nevada may be seen from the track of the Central Pacific Railroad between Humboldt Lake and the Truckee River, including a glimpse of the Carson Desert to the southward of Humboldt Lake, which was once covered by 500 feet of water.

The Carson and Colorado Railroad also passes through a portion of the basin once occupied by Lake Lahontan. On going south from Dayton the traveler by this route follows a narrow valley formed in part by the erosion of the Carson River, and subsequently occupied by Lake Lahontan. Opposite the site of Camp Churchill the road bends abruptly southward and traverses a narrow pass leading to Mason Valley; from there it follows Walker River and the eastern shore of Walker Lake and crosses the southern extremity of the old lake margin at a point a short distance south of Hawthorn. Throughout this entire distance, with the exception of a short space in the Walker River Cañon, the road is below the level of the highest beach of the old lake.

MOUNTAINS.

The numerous narrow and rugged mountain ranges of the Lahontan basin, excepting in a few instances where they are scantily clothed with cedars and pine, are nearly as barren and desolate as the intervening sagebrush valleys. The Sierra Nevada, as is well known, supports varied and beautiful coniferous forests that are valuable for the timber and wood which they supply. The trees are mainly confined to the moderately elevated portions of the range, their upper limit or the "timber line" having an elevation of about 10,000 feet. The lower extent of arborescent vegetation, more especially of the pines, is apparently determined by lack of moisture, and along the eastern base of the Sierra Nevada occurs at an elevation of about 5,000 feet. The upper limit of timber-growth is invariably occupied by pines, which, owing to the severe winter climate of the elevated regions, are dwarfed and gnarled, and, at their extreme upper limit, extended prone on the mountain side. At widely separated points in the High Sierra, where exposed to the full fury of the winter storms, the branches and trunks of the pines are stripped bare of leaves and bark, and even eroded by the drifting ice-crystals to a considerable depth, thus recording a recent climatic change that has produced more severe storms than were experienced during the earlier history of the trees. King states that this recent climatic oscillation began previous to 1870, and was the first of its kind for over 250 years.¹⁵

In the northern part of the Lahontan basin the most conspicuous ranges are the Santa Rosa, Jackson, and Pine Forest. The first two of these are scantily clothed with cedars, above which rise the bare and rugged mountain crests; the third, on the western border of the northern extension of the Black Rock Desert, is covered over a limited area with a forest of yellow pine, from which the range derives its name. The mountains bordering on the Carson Desert on the east are dark with piñon, and afford to the Pahute Indians an abundant harvest of pine-nuts during certain seasons. On the precipitous mountains overshadowing Walker Lake on the west, there is a timber band, composed almost entirely of piñon, commencing about 1,000 or 1,500 feet above the lake, and extending upwards to within

¹⁵ U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 527.

1,000 feet of the highest summits. When seen from the eastern shore of the lake, this girdle of vegetation appears like a dusky cloud-band encircling the mountain; above which rise the bare and rugged peaks forming the crest of the range. Besides the coniferous trees the mountain mahogany and the cottonwood are common in some portions of the old lake basin. The former grows in the cañons and ravines of the mountains, while the latter is found mostly along the streams, whose courses it renders conspicuous by deep green foliage in summer, and the brilliant yellow of ripened leaves in autumn.

With the few exceptions we have mentioned, the mountains of the Lahontan basin are desert ranges, frequently brilliant in color, and present a diversity of tints that are astonishing to one reared beneath more humid skies, but lacking in the shades and shadows that vegetation alone can impart. In this region the mountains are nearly all of volcanic rocks, among which the deeply colored rhyolites are conspicuous. Still more diversified are the purple trachytes of many hues, and volcanic tuffs that vary through all shades and tints, from a pure white to a deep, luminous red. In contrast with these harlequin colors are sombre mountains and rugged cliffs of basalt, sometimes veiled and partially buried beneath dunes of soft, creamy sand. The traveler over the Carson and Colorado Railroad, while passing along the eastern shore of Walker Lake, cannot fail to be impressed with the gorgeous coloring of the rhyolite hills bordering the valley on the east, especially if his journey be made in the deepening twilight, when the splendor of the western sky is rivalled by the brilliant coloring of the silent and lifeless mountains. The West Humboldt Mountains, bordering Humboldt Lake on the east, are also remarkable for the great variety of beautiful tints that are inherent in the rhyolite and tuffs composing the range. The absolutely desert mountains stretching northward from Black Rock Point, and known as the Black Rock Mountains, are so gorgeous and varied in color that they merit the name of the Chameleon Hills. The nearly parallel range to the west of these mountains has been called the "Harlequin Hills," by Mr. Webster. The aptness of the name will no doubt be appreciated by every one who has seen those naked towers and domes of rhyolite and tuff at sun rise or at sunset, when their glories are fully revealed.

RIVERS.

The rivers that enter the Lahontan basin are the Humboldt, from the east, Quinn River, from the north, and the Truckee, Carson, and Walker, from the west and southwest. All these streams flow through partially filled cañons which bear evidence of having been excavated by stream erosion previous to the first rise of Lake Lahontan. These rivers, like most others in the Great Basin, vary greatly in volume during the year. In winter and spring they become broad, rapidly flowing floods of muddy water that overspread their banks, but during the dry season, from May to November, they shrink greatly in volume, and sometimes become dry for a large part of their course.

THE HUMBOLDT RIVER.

This river¹⁶ rises on the eastern border of Nevada and flows westward for approximately 200 miles, and enters the Lahontan basin through a pass in the Sonoma Mountains, in latitude 41° . From this point it continues its course through Lahontan lake-beds for nearly 100 miles to Humboldt Lake. Throughout the dry season this is usually its terminus, but during the winter months the lake frequently overflows, and the river continues to North Carson Lake ("Carson and Humboldt Sink"), where its waters are evaporated. The Humboldt before entering the Lahontan basin receives a number of tributaries, the largest being Reese River, which enters from the south. During the summer and fall many of these streams, including Reese River, fail to reach the main channel, their waters being dissipated by evaporation or absorbed by the thirsty soil. In its course through the Lahontan lake-beds between Golconda and Humboldt Lake, the river has carved a cañon, in places 200 feet deep, since the recession of the former lake. The material removed in cutting this channel has been deposited in the northern part of Humboldt Lake, and has contributed largely to the formation of a broad low-grade delta that is already partially converted into rich meadow-lands.

¹⁶Named Humboldt by Frémont, but was previously known as Mary's, or Ogden River. See Frémont's Geographical Memoir upon Upper California, Washington, 1848, page 10.

Two measurements were made of the volume of the Humboldt, one on September 10, 1881, the second July 17, 1882; the former gave 48 and the latter 750 cubic feet per second. When the first measurement was taken the river was at its lowest stage for the year. At the time of the second measurement it was flooded, and heavy with sediment, but had fallen three feet below the line that recorded its highest rise; two weeks later its discharge had decreased nearly one half.

An analysis by Dr. T. M. Chatard of the water of the Humboldt, collected November, 1882, near Stone House, just before the river enters the Lahontan basin, is given below.

Constituents.	One liter of water contains, in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO_2)	0.0326	9.03	Silica (SiO_2)	0.0326
Alumina (Al_2O_3)	0.0013	0.37	Alumina (Al_2O_3)	0.0013
Calcium (Ca)	0.0489	13.53	Calcium carbonate (CaCO_3)	0.1222
Magnesium (Mg)	0.0124	3.46	Magnesium carbonate (MgCO_3)	0.0434
Potassium (K)	0.0100	2.77	Potassium chloride (KCl)	0.0157

If excess of CO_3 above amount required for Na_2CO_3 be calculated as NaHCO_3 , we will have 0.3453 less Na_2CO_3
 (0.0550) = 0.2903
 Na_2CO_3 = 0.0200
 NaHCO_3 = 0.0512
 Total .. 0.3615

An analysis of the water of Humboldt Lake is given on page 67.

QUINN RIVER.

Quinn River is formed by the union of many brooks that have their sources on the Santa Rosa Mountains and on the eastern slope of the Quinn River Range. It flows south for about fifty miles down Quinn River Valley and then turns abruptly westward, and continues its course until the northern end of the Jackson Range is passed; it then flows southward again and enters the Black Rock Desert. During the spring months, while the snow on the mountains is melting, this is a good-sized river, and has a swift muddy current. At Mason's Crossing, some 75 miles from its source, it is

reported to be impassable for horsemen for a number of days together during the high-water stage. At this season its waters form a shallow lake of variable size, on Black Rock Desert, that is said, at times, to be 50 or 60 miles long by 20 broad. As the dry season advances, this playa lake evaporates, leaving a vast mud-plain; the river at the same time shrinking back 75 or 100 miles. During the highest stages of Lake Lahontan, Quinn River had no existence, the greater part of its valley being occupied by an arm of the lake.

TRUCKEE RIVER.

The Truckee River has its source in the overflow of Lake Tahoe and is of greater purity and subject to less fluctuation than any other stream that enters the Lahontan basin. The lake which gives it birth is situated at an elevation of 6,247 feet¹⁷ amid the peaks of the Sierra Nevada; from this reservoir the water descends with a fall of 2,466 feet,¹⁸ to Pyramid and Winnemucca lakes, where it is evaporated, leaving the lower lakes alkaline and saline. The river is quite largely used for irrigation in the neighborhood of Reno, and to a small extent between Reno and Wadsworth. A few miles from Pyramid Lake a good-sized ditch has recently been constructed for the irrigation of the lands of the Indian reservation.

An analysis of the waters of Lake Tahoe, by Prof. F. W. Clarke, which may be considered as representing the normal condition of the Truckee River, is given herewith:

Constituents.	One liter of water contains, in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO ₂)	0.0137	18.77	Silica (SiO ₂)	0.0137
Magnesium (Mg)	0.0030	4.11	Magnesium carbonate (MgCO ₃)	0.0105
Calcium (Ca)	0.0093	12.74	Calcium carbonate (CaCO ₃)	0.0232

¹⁷ Determined by Pacific Railroad surveys.

¹⁸ Elevation of Pyramid Lake, 3,781 feet. See *postea*, page 101.

The sample, the analysis of which is reported, was collected in October, 1882, on the eastern border of the lake near Glen Brook, one mile from shore and one foot below the surface.

The most interesting feature to the geologist in the present condition of the Truckee River is its bifurcation shortly before reaching Pyramid Lake. As represented on Plate IX, the stream divides so as to deliver a part of its waters to Pyramid Lake and a part to Winnemucca Lake. The branch entering Pyramid Lake has the ordinary features of a river winding through an alluvial bottom, and has formed a low-grade delta of broad extent, as shown on the map. The waters that are tributary to Winnemucca Lake leave the main stream at nearly a right angle and flow through a deep narrow channel carved in Lahontan sediments. This stream, or "slough," when measured in September, 1882, had a volume of 2,400 cubic feet per second. From the manner in which the bifurcation takes place it cannot be considered as the breaking up of a stream on a delta or an alluvial slope, as in the case of the Carson River after entering the Carson Desert, but must have been originated by the waters overflowing from Pyramid to Winnemucca lakes, or *vice versa*. This matter, however, will receive further consideration in connection with the fluctuation of Pyramid and Winnemucca lakes (page 63).

CARSON RIVER.

The Carson River rises on the eastern slope of the Sierra Nevada, south of Carson City, and, after flowing 60 or 70 miles, enters the Lahontan basin through a deep cañon at Dayton. From this point to the Carson lakes its course is through a channel carved in Lahontan lake-beds. Near its mountain source its waters are fresh and pure, as mountain streams usually are, but in passing through Carson and Eagle valleys, once occupied by Quaternary or late Tertiary lakes, its waters become somewhat impregnated with soda salts, and in its course through Lahontan lake-beds this percentage is increased. The waste from a large number of stamp-mills now pollutes the river to such an extent that it was not thought desirable to have its waters analyzed. The valley of the Carson from Eagle Valley to Carson Desert was largely excavated by stream erosion in pre-Quaternary times,

as is shown by the fact that from Dayton to the Carson Desert it was occupied by the waters of Lake Lahontan. During the existence of the lake the valley became deeply filled with lake sediments and delta deposits, which were re-excavated as the lake fell. The present gorge is the work of the second period of excavation. The structure of the cañon between Churchill Valley and the Carson Desert is represented in the following ideal section, which shows the older cañon in volcanic rock partially filled with lacustral sediment, and the second carved out of stratified lake-beds.

FIG. 5.—Ideal cross-section of Carson River Cañon, Nevada.

Measurements of the volume of the Carson River at Old Camp Churchill, July 1, 1881, gave between 450 and 500 cubic feet per second as the volume of the stream; in September, 1883, the discharge was less than half this amount.

The bifurcation of the Carson River after entering the Carson Desert is represented on the accompanying map (Plate VII). For the history of the changes that the river has undergone during the last few years I am indebted to some of the early pioneers, who made this region their home. Previous to 1862 it flowed into the South Carson Lake, but there was an abandoned channel branching from it and leading northward. During a time of unusually high water in the spring of 1862 the river bifurcated, the old channel was reoccupied, and a branch flowed to each lake. The point at which the river divided is indicated on the map by the date 1862. Previous to that time there was a "slough" connecting the North and South Carson lakes through which the waters flowed northward. After the forking of the stream the South lake was lowered so that it no longer overflowed, and the water in the slough became stagnant. Another flood occurred in the spring of 1867 or 1869, which caused the arm emptying into North Carson Lake to branch and send a stream eastward to the slough. The last-

is shown by the fact that from Dayton to the Carson Desert is marked by the waters of Lake Lahontan. During the existence of the lake the valley became deeply filled with lake sediments and delta deposits which were re-excavated as the lake fell. The present gorge is the result of the second period of excavation. The structure of the Carson Desert, Churchill Valley and the Carson Desert is represented in the following section, which shows the older canon in volcanic rock partially filled with lacustrine sediment, and the second carved out of stratified lake beds.

FIG. 5.—Ideal cross-section of Carson River Cañon, Nevada.

Measurements of the volume of the Carson River at Old Camp Church, Ill., July 1, 1881, gave between 450 and 500 cubic feet per second as the volume of the stream; in September, 1883, the discharge was less than half this amount.

The bifurcation of the Carson River after entering the Carson Desert is represented on the accompanying map (Plate VII). For the history of the changes that the river has undergone during the last few years I am indebted to some of the early pioneers, who made this region their home. Previous to 1862 it flowed into the South Carson Lake, but there was an abandoned channel branching from it and leading northward. During time of unusually high water in the spring of 1862 the river bifurcated, the old channel was reoccupied, and a branch flowed to each lake. The point at which the river divided is indicated on the map by the date 1862. Previous to that time there was a "slough" connecting the North and South Carson lakes through which the waters flowed northward. After the fork of the stream the North lake was lowered so that it no longer overflowed, and the water in the slough became stagnant. Another flood occurred in the spring of 1867 or 1868, which caused the arm emptying into North Carson lake to branch and send a stream eastward to the slough. The last

Interval between Contours 1000 feet.

formed channel is still occupied, and is known as "New River." This distribution of the waters of the Carson still continues, but is regulated, at least in part, by slight willow dams at the points of bifurcation. Since 1862 the slough connecting the two lakes is reported to have reversed its current in some instances, according as the water in the North or South Lake was the higher. In June, 1859, the water in the slough was reported by Captain Simpson to be 50 feet wide and 3 or 4 feet deep, and flowing northward with a strong current.¹⁹ In September, 1866, Lieut. R. Birnie²⁰ states that the waters were sluggish, with scarcely a perceptible flow. In June, 1881, I found the volume of water about the same as reported by Simpson in 1859, and flowing northward with a well-marked current. In September, 1883, the slough was low, and did not exhibit any motion; South Carson Lake at the same time was very shallow, much of it presenting the appearance of a swamp.

While viewing the Carson Desert from the surrounding mountains one may trace, as on a map, the various branches of the river meandering through the monotonous plain, by the lines of vivid green cottonwood trees that mark their courses.

WALKER RIVER.

This stream rises on the eastern slope of the Sierra Nevada in two main branches between which there is a grand mountain mass known as the Sweetwater Range. The east fork of the Walker River receives the drainage from the eastern slope of the Sweetwater Range, and from the western slope of the less picturesque Wassuck or Walker River Range. The west fork flows at the base of the main range of the Sierra Nevada, and once formed a chain of small lakes, probably of Tertiary age, which cut deep channels of discharge and were drained dry. These basins are now level-floored valleys, connected by narrow and almost impassable cañons. The two branches of Walker River unite a little below the point where they formerly entered Lake Lahontan, and thence flow through Mason and Walker River valleys to Walker Lake. At the north

¹⁹ Exploration Across the Great Basin of Utah, Washington, D. C., 1876, p. 85.

²⁰ Annual Report of the Chief of Engineers, U. S. A., 1877, p. 1264.

end of Mason Valley the river bends abruptly southward, at the same time increasing the depth of its channel, which soon becomes a cañon through lake-beds similar to the ones carved by the Humboldt and the Truckee. Captain Simpson reports the Walker River near its mouth to have been about 100 yards wide and from 6 to 10 feet deep on June 7, 1859.²¹ A measurement of the volume of the river about 3 miles from its mouth, June 4, 1881, gave 400 cubic feet per second as the rate of flow. In October of the following year its bed was dry, and little, if any, water reached the lake from this source. This decrease during the dry season is evidently due in a great measure to the extensive use of its waters for irrigation in Mason Valley. As a rough average, the data at hand being inexact, I have assumed 200 cubic feet per second, or 700,000,000 cubic yards annually, as the approximate discharge. An analysis of a sample of water collected October, 1882, at a point just below where the main branches of the river unite, is reported by Prof. F. W. Clarke, as follows:

Constituents.	One liter of water contains, in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO ₂)	0.0225	12.50	Silica (SiO ₂)	0.0225
Calcium (Ca)	0.0228	12.66	Calcium carbonate (CaCO ₃)	0.0570
Magnesium (Mg)	0.0038	2.12	Magnesium carbonate (MgCO ₃)	0.0133
Potassium (K)	Trace.		Sodium chloride (NaCl)	0.0216
Sodium (Na)	0.0318	17.67	Sodium sulphate (Na ₂ SO ₄)	0.0421
Chlorine (Cl)	0.0131	7.28	Sodium carbonate (Na ₂ CO ₃)	0.0224
Sulphuric acid (SO ₄)	0.0284	15.77	Total (99.39 per cent. accounted for)	0.1789
Carbonic acid (CO ₂) by difference	0.1224	68.00		
	0.0576	32.00		
Total	0.1800	100.00		

The measurements of the volumes of the rivers of the Lahontan basin at different seasons indicate the great fluctuations to which the drainage in a desert country is subject. The rivers are flooded during the winter and spring—which includes the rainy season, and also the time when the mountain snows are melting most rapidly—and diminish greatly in volume during the parched and arid summer months. The Truckee River is an exception to this rule, as it is the overflow of a great reservoir, Lake Tahoe,

²¹ Explorations Across the Great Basin of Utah, Washington, D. C., 1876, p. 87.

which serves to equalize its volume, as well as to clear its waters of impurities in suspension. A knowledge of the composition of the rivers entering the Lahontan basin and their average volume enables one to estimate roughly the amount of mineral matter in solution that these streams are now contributing to the lakes that they supply. This subject will be reverted to in discussing the chemical history of Lake Lahontan.

SPRINGS.

Springs have been grouped with reference to their mode of occurrence, in two convenient classes: (a) Hillside springs and (b) Fissure springs.

Hillside springs are usually formed by the gathering of percolating meteoric waters in inclined porous strata, which alternate with less pervious beds, and outcrop on a hillside or among mountains in such a manner as to afford an escape for the subterranean waters. The source of the water forming hillside springs is in the rainfall of the immediate neighborhood. They are commonly small, and their temperature is approximately the same as the mean temperature of the locality at which they are found. Springs of this class are usually agreeable to the taste and useful for domestic purposes, for the reason that they are seldom highly charged with mineral matter.

In western Nevada the conditions favoring the formation of hillside springs are almost entirely absent. The rocks throughout the region are very largely volcanic without definite stratification, and the rainfall is limited to a few inches annually. Owing to these unfavorable conditions, there are no springs of this class in the Lahontan basin to claim our attention.

Fissure springs occur where the earth's crust has been broken, usually with some displacement, to a great depth. Their water supply, as in the first instance, is from meteoric sources, but is derived from regions remote from the point of discharge. Owing to the depth to which the water of fissure springs frequently descends during its subterranean passage, it is commonly highly heated and not unfrequently reaches the surface with the temperature of boiling water. The heat and the great pressure to which the

water is subjected during its underground passage render it an active solvent. Hot springs are therefore frequently charged with a great variety of mineral substances in solution.

The Lahontan basin, in common with the entire northern half of the Great Basin (the southern portion not being so thoroughly explored), is remarkable for the number of springs which rise from a great depth through fissures. These almost invariably occur along lines of displacement, and range in temperature from 50° or 60° F. up to the temperature of boiling water for the elevation at which they occur.

The springs of the Lahontan basin are indicated on the accompanying map, Plate VIII; their maximum temperature when known being shown by figures in red.

As springs performed an important part in the history of Lake Lahontan, we shall devote a few pages to the description of those now rising in its basin. A knowledge of the phenomena they now present will assist in interpreting the records of the similar springs that flowed long ago.

Beginning at the south, the first group of springs requiring notice is found in the northern part of Mason Valley, about one mile northward of Wabusca station. These springs occur in circular basins, sometimes at the tops of low mounds, and are of all degrees of temperature, from about the mean of the region up to 162° F. The water flowing from them is clear and sparkling, but is somewhat alkaline to the taste, and contains a small percentage of sulphate and carbonate of soda, common salt, etc. The water collecting in small basins on the desert is evaporated, and has formed a saline deposit of considerable extent, a section of which is given below:

White, hard crust of sulphate of soda, with common salt, some calcium carbonate, etc.....	inches..	1-2
Soft, mealy or clayey deposit of sodium sulphate, calcium carbonate, calcium sulphate, etc.....	inches..	2-7
Clear transparent crystals of sodium sulphate, with some earthy impurities, resting on saline clay.....	feet..	6-8

The surface of the desert about the more abundant accumulation of salts is covered over a large area with a white saline efflorescence. These springs occur in an east and west line, that coincides with the course of a

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

The underground passage render it an active source of water, therefore frequently charged with a great variety of mineral substances.

The geothermal region in connection with the entire northern half of the lake (the southern portion not being so thoroughly explored), is characterized by the number of springs which rise from a great depth through the crust. These springs usually occur along lines of displacement, and range in temperature from 100° F. up to the temperature of boiling.

The locations of the geothermal basins are indicated on the accompanying map, the temperature when known being shown.

The geothermal region is an important part in the history of Lake Lahontan. The description of those now rising in the region, and the place where they now present will assist in the study of the springs that flowed long ago.

The first group of springs requiring notice is located in the Snake Valley, about one mile northward of the mouth of the Snake River. These springs issue in circular basins, sometimes at the surface of the water, and at all degrees of temperature, from about the boiling point down to 100° F. The water flowing from them is clear and alkaline to the taste, and contains a small amount of carbonate of soda, sodium salt, etc. The water evaporates on the desert, and has formed a considerable extent, a specimen of which is given below:

... of sulphate of soda, sodium salt, some calcium carbon-	... inches...	1-2
... of clayey deposit, ... carbonate, calcium carbonate, calcium carbonate, etc.	... inches...	2-7
... of ... with some earthy impurities, resting on ...	... feet...	6-8

SPRINGS OF THE LAHONTAN REGION.

Fahrenheit Temperature

Scale: 29 miles = 1 inch

post-Lahontan fault which is plainly shown by an irregular scarp, in some places 20 feet high.

Allen's Springs are situated on the southern border of South Carson Lake at the base of a high basaltic butte which once formed an island in Lake Lahontan. These springs at present are very small, the discharge at the surface being less than half a gallon per minute. In this desert country even this meager supply is important, as it is the only drinkable water within a radius of over twenty miles. These springs are of interest to the geologist because of their antiquity. The amount of yellowish, porous, tufa deposited about them indicates that the flow of water was formerly more copious than at present, and at various times has issued from a number of orifices. Much of the tufa that is plainly a spring deposit is incrustated with thinolite and dendritic tufa which we know was precipitated from the waters of Lake Lahontan, and shows that the springs were in existence at least as early as the middle Lahontan period.

The Hot Spring, at Hot Spring station on the Central Pacific Railroad, as shown by Dr. T. M. Chatard's analysis, has the following composition:

Constituents.	One liter of water contains in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO ₂)	0.2788	11.14	Silica (SiO ₂)	0.2060
Aluminum (Al)	0.0010	0.04	Sodium silicate (NaSiO ₃)	0.1480
Calcium (Ca)	0.0305	1.23	Aluminum sulphate (Al[SO ₄] ₃)	0.0063
Magnesium (Mg)	0.0010	0.04	Calcium sulphate (CaSO ₄)	0.1037
Potassium (K)	0.0669	2.69	Magnesium sulphate (MgSO ₄)	0.0050
Lithium (Li)	Trace.	Trace.	Sodium sulphate (NaSO ₄)	0.4039
Sodium (Na)	0.7743	31.04	Sodium chloride (NaCl)	1.4946
Chlorine (Cl)	0.9679	38.79	Potassium chloride (KCl)	0.1278
Sulphuric acid (SO ₄)	0.3555	14.25	Total	2.4953
Oxygen* in SiO ₃	0.0194	0.78		
Total	2.4953	100.00		

* Extra oxygen in silicate.

No carbonic acid in residue left by evaporation.

At a number of orifices the waters of this spring issue in a state of active ebullition. When the openings become obstructed the steam escapes with a hissing and roaring sound. The spring occurs in a line of recent faulting, and has evidently been crowded southward as the deposits from the waters closed the previous channels of discharge. On cooling, an

abundant deposit, consisting principally of common salt and sodium sulphate, is found. At one time these waters were thought to contain sufficient boracic acid to be of economic importance, and an attempt was made to separate it, but the experiment was a failure. There is no evidence to show that this spring was active during the existence of Lake Lahontan.

A number of small springs, some of which are warm, occur on the west side of Winnemucca Lake. Farther northward small springs of pure cold water have been found on both sides of the Selenite Range.²² Near the north end of this range, but isolated from it, stands Hot Spring Butte, once a small island in Lake Lahontan. The butte derives its name from a copious spring with a temperature of 180° F. which discharges about 20 gallons per minute. The water flows northward for about a mile, and forms a shallow pool in the desert, where it is evaporated. Other hot springs occur northward of Hot Spring Butte, near the southern end of the Jackson Range.

Numerous copious springs of all temperatures, from the mean of the region up to the boiling point of water, come to the surface along the western border of the Lahontan basin, from Honey Lake Valley to the Oregon boundary. The majority of these have formed circular basins that are filled with beautifully clear water, and are sometimes of great depth, as in the case of Deep Hole, Round Hole, and the group at the east end of Granite Mountain. The bottoms of the basins are usually of flocculent mud, through which the water issues, frequently accompanied by bubbles of gas. In common with very many other hot springs, these basins are lined with deep green confervoid growths. Many of the springs in the belt indicated exhale sulphuretted hydrogen, and deposit amorphous, calcareous tufa. In one instance silicious sinter is precipitated as the water cools. All the springs in this belt occur either on fault lines that have been disturbed by orographic movement since the withdrawal of the waters of Lake Lahontan, or are very closely related to such lines of displacement.

²²This range is about 30 miles long and extends from the north end of Winnemucca Lake to Hot Springs Butte; it is structurally distinct from the Natches or Truckee Range, which follows the eastern shore of Winnemucca Lake. I have named it in reference to extensive deposits of crystallized gypsum or selenite that outcrop along its western border.

The character of these recent faults will be described in the chapter devoted to post-Lahontan orographic movements.

The springs in this belt are too numerous to receive detailed description, and we can only notice a few of the most important ones. The most copious single spring in the series occurs near the northern shore of Honey Lake, designated as Schaffer's Spring on the accompanying map, and discharges about 100 cubic feet of boiling water per minute. The ebullition is so energetic that the water is thrown in a column to the height of 3 or 4 feet. An analysis of this water by Dr. T. M. Chatard shows the following composition:

Constituents.	One liter of water contains in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO_2).....	0.1310	12.83	Silica (SiO_2).....	0.1008
Calcium (Ca).....	0.0121	1.18	Sodium silicate (Na_2SiO_3).....	0.0613
Magnesium (Mg).....	0.0004	0.04	Calcium sulphate (CaSO_4).....	0.0409
Sodium (Na).....	0.3040	29.78	Magnesium sulphate (MgSO_4).....	0.0020
Potassium (K).....	0.0094	0.92	Sodium sulphate (Na_2SO_4).....	0.4715
Chlorine (Cl).....	0.2070	20.27	Potassium chloride (KCl).....	0.0180

Total.....	1.0211	100.00	Total (99.93 per ct. accounted for).....	1.0211

* Oxygen necessarily added to form Na_2SiO_3 . A slight trace of CO_2 in residue left on evaporation.

This spring occurs at the southern end of a long row of tufa crags, fully 50 feet high and somewhat greater in breadth, a few of which still have small springs issuing from their bases. The tufa at the base of the crags, and forming the nucleus of the deposit, is amorphous, but is coated with a heavy deposit of the dendritic variety hereafter to be described. The former was a direct precipitate from spring water, but the latter was as plainly deposited from the former lake. The evidence is such as to lead to the conclusion that this spring was fully as copious during the existence of Lake Lahontan as now, and that its point of discharge was crowded southward along a fissure as its former outlets became filled with calcareous tufa deposited from its own waters.

About 5 miles southeastward of the spring described above occurs a group of springs covering several acres and discharging a very large volume of heated water, which issues at so many orifices that no estimate of

the total outflow could be obtained. At a number of points the temperature of the water approximates to the boiling point, and, on cooling, deposits a limited quantity of calcareous tufa. A qualitative examination indicates that these springs have about the same chemical composition as the water of Schaffer's Spring, an analysis of which is given above.

High Rock Spring, situated 5 miles eastward of the group described in the last paragraph, occurs at the base of large tufa crags of Lahontan date, and has a temperature of 100° F. Its waters are used for irrigation, and are inhabited by both fish and mollusks. This spring is evidently of considerable antiquity, as the tufa crags deposited from its waters are coated with heavy layers of calcium carbonate that have a dendritic structure and were without question deposited from the lake waters which once flooded the valley.

None of the numerous springs on the western border of Smoke Creek Desert are remarkable for their high temperatures, but a number are thermal, and nearly all bear indications of having been hot springs at some former time. There is no evidence that any of these springs were in existence during the time when Lake Lahontan covered the desert.

On the border of the desert at the eastern end of Granite Mountain a group of circular basins filled with heated waters from a subterranean source covers a considerable area. A number of these basins furnish water of wonderful transparency, which overflows to the eastward, and on evaporating leaves a saline incrustation that covers many acres. Others occur in the tops of low mounds and are caldrons of boiling mud that occasionally erupt and discharge their tenacious contents to a distance of 30 or 40 feet. This group is known as the Mud Springs.

The most copious outflow of hot water in the Lahontan basin occurs in a small embayment of the ancient lake a few miles north of Granite Mountain. This is a group of springs several acres in extent which fill circular basins in the tops of low mounds that have been formed to some extent by spring deposits, but are largely composed of vegetable growths mingled with æolian sand and dust. These springs vary through all degrees of temperature, from 50° to 60° F. up to that of boiling water, and their discharge forms a creek of heated water of considerable size that pours into

a deep basin and becomes ponded before spreading out over the desert and evaporating. Many of the basins in this group are lined with amorphous calcareous tufa; and one, filled with boiling water, is depositing both silica and tufa. The siliceous sinter precipitated from these waters is gelatinous at first, but soon hardens and forms mushroom-shaped scollops which fringe the sides of the basin and the margins of the channel of discharge. The deposition of silica takes place quite rapidly as the water cools, and in some instances imprisons insects that have been killed by venturing into the boiling waters.

An analysis by Dr. T. M. Chatard of one of the most typical of the springs in the group described briefly above, from which calcareous tufa is being deposited, is given below:

Constituents.	One liter of water contains in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).
Silica (SiO ₂)	0.1136	9.60	Silica (SiO ₂)	0.0180
Calcium (Ca)	0.0367	3.10	Sodium silicate (Na ₂ SiO ₃)	0.1942
Magnesium (Mg)	0.0034	0.29	Calcium sulphate (CaSO ₄)	0.1247
Sodium (Na)	0.3554	30.03	Magnesium sulphate (MgSO ₄)	0.0170
Potassium (K)	0.0191	1.61	Sodium sulphate (Na ₂ SO ₄)	0.4267
Lithium (Li)	Trace.	Trace.	Potassium chloride (KCl)	0.0363
Chlorine (Cl)	0.2396	20.25	Sodium chloride (NaCl)	0.3665
Sulphuric acid (SO ₄)	0.3901	32.97		
Oxygen* (O)	0.0255	2.15	Total (99.43 per cent. accounted for)	1.1834
Carbonic acid (CO ₂)	Trace.	Trace.		
Total	1.1834	100.00		

* Oxygen necessarily added to form Na₂SiO₃.

Hot springs of considerable volume occur in groups near the southern end of Black Rock Point and along both the eastern and western borders of the Black Rock Range, and also on the borders of the desert at the eastern base of the Pine Forest Range. Continuing northward, the belt of hot springs we have been tracing is represented in Pueblo Valley by two steaming caldrons, and at the eastern base of Stein Mountain other outlets of a similar nature have been examined. Nearly every spring throughout the entire region between Honey Lake Valley, California, and Alvord Valley, Oregon, a distance of over 200 miles, has been observed to occur on a line of recent displacement.

In all, there are at present between fifty and sixty groups of hot springs in the Lahontan basin; the total number of individual outflows cannot be estimated at less than two or three hundred. It is impossible to estimate the amount of water entering the basin from subterranean sources with even an approximation to accuracy, but if gathered in a single stream it would form a river comparable in size with the Humboldt during the summer season, the volume of which would remain practically constant from year to year. The temperature of this imaginary river would be far above the normal for the region; and in composition it would be much richer in dissolved minerals than ordinary surface streams, as is indicated by the accompanying analyses.

It is certain that many of the hot springs now flowing were in existence during the time that Lake Lahontan flooded the valleys of northwestern Nevada; and it is believed that the three analyses given above not only represent approximately the average composition of the springs now flowing, but also indicate the character of the thermal waters that entered the ancient lake through fissures in its bottom.

EXTINCT SPRINGS.

At many points in the Lahontan basin, as mentioned in the preceding pages, we find deposits made by springs which are now extinct. The majority of these are composed of calcareous tufa that was precipitated about sublacustral springs, and will be described in the chapter devoted to the chemical history of the former lake. A group of spring-mounds about half a mile southward of Humboldt House and on the west side of the Central Pacific Railroad track, are, however, of a different nature. They are low domes composed principally of calcareous tufa, open at the top and filled within with crystallized gypsum impregnated with sulphur. The presence of sulphur has led to some exploration, but the supply is evidently too limited to be of much economic importance.²³ The mounds in this group are broad and comparatively low domes, formed of thatch-like layers of calcareous tufa with considerable quantities of siliceous sinter, especially about

²³ These sulphur deposits were the only ones that could be found by the writer in the neighborhood of Humboldt House, and are thought to be the ones described in the reports of the United States Geological Exploration of the Fortieth Parallel, Vol. II, p. 742.

their bases. These deposits are unlike the greater part of the old tufa structures occurring abundantly in the same basin, especially in the neighborhood of Pyramid Lake, but agree in form and structure with the rings and domes now forming about many subaërial hot springs; thus indicating that the deposits in question are of post-Lahontan date. The presence of siliceous sinter also indicates that these deposits were of subaërial origin, as no precipitates of this nature from sublacustrine springs are known.

LAKES.

At present there are seven lakes in the Lahontan basin. These are Honey Lake, California; Pyramid, Winnemucca, Humboldt, North Carson, South Carson, and Walker lakes, Nevada. To these we may add the two Soda lakes near Ragtown, Nevada, as occurring in the same basin, but these are of a decidedly different character from those enumerated above, and will receive special attention. These lakes are of assistance to the geologist in interpreting the history of the great lake which formerly flooded all their valleys; we shall, therefore, describe them somewhat minutely.

HONEY LAKE.

Honey Lake Valley was occupied by the western arm of Lake Lahontan, and became deeply filled with lake sediments. At present it is a broad, level-floored, sage-brush-covered plain, with fruitful areas on its western and northern borders where water is available for irrigation, and has an absolutely barren playa of considerable extent on its eastern margin near Fish Spring. The lake occupies a shallow depression in the western part of the valley, and may be classed as a playa lake, as it is without outlet and becomes completely desiccated during seasons of unusual aridity. It is supplied principally by Susan River, which enters it from the northwest; but it receives some tribute during the rainy season from Long Valley. The hot springs along its northern border also furnish considerable quantities of water. The area of the lake varies with the seasons, as well as from year to year, as is common with all inclosed lakes. As mapped by the survey in charge of Captain Wheeler, in 1867 it covered an area of approximately

90 square miles. In the summers of 1859 and 1863 it is reported by the settlers in the valley to have become completely desiccated, leaving a broad smooth plain of cream-colored mud. Its average depth in the summer of 1877 is reported by Lieutenant Symonds²⁴ to have been about 18 inches. In 1882 its greatest depth was 4 feet, but the average, as nearly as could be judged, did not differ much from the figures given for 1877. The outline of the lake is indefinite, as its shores are usually low and marshy, and in places form broad tule swamps. Its waters are quite strongly alkaline, unfit for human use, and always of a greenish-yellow color, due to the impalpable mud held in suspension. A preliminary examination of the water shows that it contains 0.0784 per cent. of saline matter in solution. Qualitative tests show the water to be alkaline and charged with chloride of sodium, and carbonate and sulphate of soda, together with some potash and magnesia.

PYRAMID LAKE.

Pyramid Lake was discovered January 10, 1844, by General Frémont, who first saw it from the mountains at its northern end. From the remarkable form of an island near its eastern shore its discoverer gave it the name which it now bears.²⁵

The accompanying map of Pyramid and Winnemucca lakes (Plate IX) was made in August and September, 1882, by Mr. Johnson, and shows an accurate outline of the lakes as they existed at that time. The soundings indicated are from actual observation, the position of the boat at the time of measuring the depth being determined with instruments stationed on shore. The sublacustrine contour lines, drawn at intervals of 50 feet, are in part conjectural, but are believed to represent approximately the topography of the lake bottom. The north and south axis of Pyramid Lake is 30 miles in length; in the widest part, near the northern end, its breadth is 12 miles; farther southward between Anaho Island and the southern end of the lake it is contracted to about 5 miles. Its area in September, 1882, was 828 square miles. Our soundings determined that the greatest depth occurs

PYRAMID AND WINNEMUCCA LAKES, NEVADA.

a few miles north of Anaho Island where the water is 361 feet deep over a very considerable area; showing that the bottom in this portion is a nearly uniform plain. As the Lahontan beach is 525 feet above the 1882 level of Pyramid Lake, the former lake had a depth of 886 feet, without considering, however, the amount of sedimentation that has since taken place. This was the deepest point in Lake Lahontan.

Pyramid Lake is without outlet. It receives almost its entire supply from the Truckee River, which enters it at its southern end. During the rainy season the surrounding mountains send down some tribute, supplied principally by two small brooks from the western side of the valley, which are living streams for a portion of the year; but the supply from these sources is extremely small. As nearly all of the fresh water entering the lake is delivered at its southern end the lake varies in salinity as one follows it northward. Near the mouth of the Truckee River the waters are sufficiently fresh to be used for camp purposes; at the northern end it is far too saline and alkaline for human use, but may be drunk by animals without injury. The waters of Pyramid Lake from two localities and at different depths have been analyzed by Prof. F. W. Clarke, who reports their composition as follows:

Water of Pyramid Lake collected in August, 1882, at b, south of Anaho Island (see Plate IX).

* 99.94 per cent. accounted for in sample from 1 foot below surface, and 100.15 per cent. (error 0.15 per cent.) in the remaining sample.

All the water samples from Pyramid Lake when analyzed contained a small quantity of suspended flakes of calcareous and siliceous matter, which had separated since the samples were bottled.

These analyses show much less difference in the composition of the water near the northern and near the southern ends of the lake than was anticipated; and the examination of top and bottom samples fails to indicate an increase in salinity with increase in depth, such as was found by Lartet in the case of the Dead Sea.²⁶ The bearing of the present composition of Pyramid Lake on the interpretation of the history of the ancient lake which flooded the same basin will be considered in connection with the chemistry of the other lakes of the basin. Standing alone, the analyses of the water of the present lake are of geological interest as showing the composition of waters that are now depositing calcareous tufa of the same general character as that first found in Lake Lahontan.

During our measurements of the depth of the lake the cup at the end of our sounding lead seldom failed to bring up a specimen of the bottom. From the samples thus obtained we learn that the bottom near shore is usu-

²⁶ Exploration Géologique de la Mer Morte, Paris, 1877, p. 278.

ANAHO ISLAND, PYRAMID LAKE, NEVADA.

ally composed of sand or gravel in which the shells of fresh water gastropods were frequently obtained. At a distance of a few rods from land the bottom invariably became muddy, excepting in sheltered bays, where the littoral deposits had a greater breadth than when the lake margin was precipitous. In all the central portions of the lake the bottom is of fine tenacious mud, either gray in color or intensely black, and having the odor of sulphuretted hydrogen. The samples of black mud when dried in the open air lost their inkiness as well as their odor, and became identical with the gray mud occurring in other localities.

In the southern portion of the lake the water is slightly discolored, and is charged with a multitude of shining particles that are rendered visible when a ray of light is passed through it. The lack of transparency is apparently due to the suspended silt brought down by the Truckee River. In the northern part of the lake the water becomes wonderfully clear, and at some distance from land of a deep blue color. On looking down into the waters from the neighboring hills the color appears almost black, or black tinged with deep blue. Near shore, especially where the bottom is of white sand, the water presents a clear greenish-blue tint, as is the case on nearly all lake shores where the bottom is light colored. When thrown into breakers by strong winds it exhibits a play of colors that is only rivaled in beauty by the surf of the ocean.

The largest and most attractive islands in the lake are Pyramid and Anaho, which rise in its southern portion near the eastern shore. Anaho Island, as determined by engineer's level, is 517 feet above the water level of 1882, and is surrounded by water from 150 to 300 feet deep. We present an accurate map of it, prepared in August, 1882 (Plate II), from which future changes in lake level may be determined. When seen from a distance the island presents a convex outline due to the deposition of vast amounts of tufa at certain horizons. A broad terrace has been carved all around it at an elevation of about 100 feet above the lake, and forms a pediment for the extremely rugged crags that are piled upon it. The contour formed by the water line of this terrace is indicated by the lower of the three dotted lines on the map; the next above marks the water level at the dendritic stage; and the highest of all is the Lahontan beach. This island,

although without fresh water, and but scantily clothed with vegetation, is one of the most instructive points about Pyramid Lake, and will well repay a visit from the geologist or the artist. During the time that Lake Lahontan had its greatest extent, Anaho Island rose but a few feet above its surface.

Pyramid Island, as determined by sights with an engineer's level from Anaho Island, rises 289 feet above the lake; the water near its base is from 150 to 175 feet deep. As remarked by Frémont, its regular pyramidal form and precipitous sides give it a striking resemblance to the great pyramids of Egypt. Its sides are somewhat convex owing to the immense accumulation of tufa deposited upon them, and are difficult to scale. On the accompanying plate this island is represented as it appears from the neighboring shore.

The most picturesque portion of the shores of Pyramid Lake is at the northern end, where a rugged cape, known as "The Needles," projects a mile or more from the main land, and has near it many small islands of peculiar and sometimes fantastic form. This group of spires, domes, and crags exhibits rock forms of the most rugged description, and furnishes the grandest display of tufa in all their varieties that is to be found in the Lahontan basin. A general view of this picturesque point is given on the accompanying plate, which is sketched from a photograph taken on the lake shore to the westward of The Needles. The highest of the spire-like masses, rising 300 feet above the lake, is shown somewhat in detail in the illustration forming Plate XIII. A photograph of one of the islands near The Needles, taken from the peninsula, is given on Plate XXXVIII. Plate XXXIX also illustrates the remarkable towers and domes that the tufa deposits here simulate.

On the northern side of the peninsula a number of hot springs rise from the bottom of the lake and along the base of the tufa crags, and are forming a deposit of calcareous tufa beneath the lake surface. This accumulation is soft and creamy white, and forms a more or less regular layer over considerable areas. The hot water of the submerged springs rises from many orifices, a number of which have built up tubular chimney-like growths 5 or 6 inches high that sometimes look not unlike mushrooms, but always have one or more openings at the top, through which the spring-water issues. The carbonate of lime is deposited when the hot spring-water

On the northern side of the peninsula a number of hot springs rise from the bottom of the lake and along the base of the tufa crags, and are forming a deposit of calcareous tufa beneath the lake surface. This accumulation is soft and creamy white, and forms a more or less regular layer over considerable areas. The hot water of the submerged springs rises from many orifices, a number of which have built up tubular chimney-like growths 5 or 6 inches high that sometimes look not unlike mushrooms, but always have one or more openings at the top, through which the spring-water issues. The carbonate of lime is deposited when the hot spring-water

SKETCH OF PYRAMID ISLAND, PYRAMID LAKE, NEVADA.

comes in contact with the colder and more dense waters of the lake. A few of the deposits from these springs are represented, half natural size in the following figure:

FIG. 6.—Deposits of calcium carbonate from sub-lacustral springs.

Among The Needles the rocky capes are connected by crescent-shaped beaches of clean, creamy sands, over which the summer surf breaks with soft murmurs. These sands are oolitic in structure, and are formed of concentric layers of carbonate of lime which is being deposited near where the warm springs rise in the shallow margin of the lake. In places these grains have increased by continual accretion until they are a quarter of an inch or more in diameter, and form gravel, or pisolite, as it would be termed by mineralogists. In a few localities this material has been cemented into a solid rock, and forms an oolitic limestone sufficiently compact to receive a polish. No more attractive place can be found for the bather than these secluded coves, with their beaches of pearl-like pebbles, or the rocky capes, washed by pellucid waters, that offer tempting leaps to the bold diver. The tufa forming The Needles is gray in tone, with a light-colored band, 10 or 12 feet broad at the base, consisting of a coating of very recent calcareous deposit, similar to that forming the oolitic sands, but probably not dependent on spring action. On the cliffs the nucleus about which the lime crystallized was immovable, and became coated with a continuous layer of calcium carbonate; on the beach the sands were washed about by the waves, and grew into little spheres of polished marble. A band of recently-formed tufa, like that surrounding the base of The

GEOLOGICAL HISTORY OF LAKE LAKONTAN.

terrace occurs around the borders of all the islands in the lake, and may be distinguished at many points on the shores of the mainland. By comparing a photograph of "The Domes," near Pyramid Island, taken in the summer of 1882, with the photograph of the same locality taken in 1867, as published in the report of the United States Geological Exploration of the Fortieth Parallel (Vol. I, Plate XXIII); we learn that the surface of Pyramid Lake in the older photograph is 10 or 12 feet higher than when the later picture was taken. As this difference in the levels of the lake corresponds with the breadth of the band of recently-formed tufa, we are led to believe that the deposition of the calcareous deposit took place during the recession of the lake thus recorded. The shores of Pyramid Lake, like those of all the lakes in the lower portions of the Great Basin, are without trees or shrubs, and clothed only with a scanty growth of desert vegetation. Although the scenery about this lake impresses one with its desolation and want of life, yet the rugged mountains surrounding it and the clear, bright blue of its waters combine to form a picture of more than ordinary grandeur. Like the ocean, its surface appears bright and blue in the sunshine and cold and gray in the storm. Even in summer the gales rise suddenly, without warning, and sweep down upon the lake with the fury of a tempest. Sometimes within a few moments the lake is changed from a placid mirror to a sea of frothing billows that break on the shore in long lines of foam. The suddenness with which the wind changes, and the bleak, inhospitable character of the shores, make the navigation of this lake somewhat dangerous, even to experienced boatmen. Many tales of adventure, sometimes accompanied by loss of life, are related by those who have experienced the sudden storms of this inland sea.

The lake is abundantly supplied with splendid trout, *Salmo purpuratus Henshawi*, Lord, and, as stated by Prof. E. D. Cope,²⁷ is also inhabited by *Leucis olivaceus*, *Leucis dimidiatus*, *Siphateles lingatus*, *Squalius gallice*, *Chasmistes cujus*, *Catostomus Tahoeensis*; of mollusks, three species—*Pompholyx effusa*, Lea, var. *solida*, Dall.; *Pyrgula Nevadensis*, Stearns; and *Pyrgula humerosa*, Gould—are living in its waters, and their dead shells occur in abundance along the shore.

U. S. GEOLOGICAL SURVEY

LAKE LAHONTAN PL. XII

THE NEEDLES, PYRAMID LAKE, NEVADA.

The resemblance of Pyramid Lake to an arm of the sea is enhanced by the presence of numerous sea-birds. About The Needles especially one sees large numbers of gulls, terns, cormorants, pelicans, together with geese, ducks, swans, herons, bitterns, etc. Many of these find convenient nesting places in the hollows of the calcareous tufa. During our visit to Anaho Island in August, 1882, there were two large pelican "rookeries," in each of which there were 600 or 800 young birds.

WINNEMUCCA LAKE.

This, like its sister lake, occupies a long, narrow valley, formed by orographic displacement, and is a fair illustration of a lake occupying a fault basin. It is 26 miles long, with an average breadth of about $3\frac{1}{2}$ miles, the longer axis being due north and south. As in the case of Pyramid Lake, its waters are alkaline and brackish. The following analysis by Prof. F. W. Clarke is of a sample collected in August, 1882, near the center of the lake (at *c*, Plate IX) and 1 foot below the surface:

Constituents.	One liter of water contains in grammes—	Per cent. in total solids.	Constituents.	Probable combination (in grammes per liter).

Total	3.6025	100.00		

Nearly all of the water that supplies the lake enters at its southern end, and consequently causes this portion to be fresher than the northern part. As stated while describing the Truckee River, the water supplying this lake is a branch of the main stream. The only published account known to us of the bifurcation of the Truckee River, so as to supply two lakes, is given by Mr. King,²⁸ who states that—

At the time of our first visit to this region, in 1867, the river bifurcated; one half flowed into Pyramid Lake, and the other through a river four or five miles long into Winnemucca Lake. At that time

²⁸ U. S. Geological Exploration of the Fortieth Parallel, Vol. I., pp. 505-6.

the level of Pyramid Lake was 3,890 feet above the sea, and of Winnemucca about 80 feet lower. Later, owing to the disturbance of the balance between influx and evaporation already alluded to as expressing itself in Utah by the rise and expansion of Great Salt Lake, the basin of Pyramid Lake was filled up, and a back water overflowed the former region of bifurcation, so that now the surplus waters all go down the channel into Winnemucca Lake, and that basin is rapidly filling.

Between 1867, the time of my first visit, and 1871, the time of my last visit, the area of Winnemucca Lake had nearly doubled, and it has risen from its old altitude about 22 feet, Pyramid Lake in the same time having been raised about 9 feet. The outlines as given upon our topographical maps are according to the survey of 1867, and form interesting data for future comparison.

The differences in elevation between Pyramid and Winnemucca lakes, as reported by Mr. King, and as determined by the present survey in August, 1882, are as follows: In 1867 Pyramid was 80 feet higher than Winnemucca (U. S. Geol. Expl. 40th Parallel, Vol. I, p. 505); in 1872 Pyramid was 67 feet higher than Winnemucca (U. S. Geol. Expl. 40th Parallel, Vol. I, p. 506); in 1882 Pyramid was 12 feet higher than Winnemucca, as determined by engineer's level.

We know of no accurate means of determining how much each lake individually has varied since 1872, but the decrease in the difference of the levels of the two lakes is certainly due in part to the lowering of the waters of Pyramid Lake, as is indicated by recent tufa deposits and lines of bleached sea-weed at an elevation of about 12 feet above the present surface of the lake. From the data now in hand, providing that all the measurements are correct, it is evident that Winnemucca Lake has risen over 40 feet since 1872, and over 50 feet since 1867.

The history of the fluctuations of these lakes is supplemented and enlarged by the statements of Mr. George Frazier, who has been familiar with the region since 1862. In his judgment Winnemucca Lake has risen about 40 feet in the last twenty years. In 1862, the branch of the Truckee River that supplies Winnemucca Lake was so low that a person could cross it by stepping from stone to stone, at a point where it is now not less than 25 feet deep. The lake was then confined to the northern extremity of its basin, and the stream reached it after meandering through meadow lands that are now 15 or 20 feet under water. At that time the channel of the stream could be traced along the bottom of the lake for some distance, and dead cottonwood trees were standing in the water, showing that the lake had previously been much lower. Dead trees standing in Pyramid Lake, some distance from the shore, bore similar evidence to the rise of that lake

AMONG THE NEEDLES, PYRAMID LAKE, NEVADA.

THE HISTORY OF LAKE LAHONTAN.

...about 80 feet above the sea, and of Winnemucca about 80 feet lower. Between influx and evaporation already alluded to as the cause of the increase of Great Salt Lake, the basin of Pyramid Lake was the region of bifurcation, so that now the surplus waters flow into Pyramid Lake, and that basin is rapidly filling. In 1867, and 1871, the time of my last visit, the area of Winnemucca was about 22 feet from its old altitude about 22 feet, Pyramid Lake in the ... The outlines as given upon our topographical maps are ... interesting data for future comparison.

The difference in elevation between Pyramid and Winnemucca lakes, as determined by the present survey in 1867, was 80 feet higher than ... (U. S. Geol. Expl. 40th Parallel, Vol. I, p. 505); in 1872 Pyramid was 12 feet higher than Winnemucca, as ... level.

There are no accurate means of determining how much each lake has risen since 1872, but the decrease in the difference of the ... is certainly due in part to the lowering of the waters ... indicated by recent tufa deposits and lines of bleached ... of about 12 feet above the present surface of the ... data now in hand, providing that all the measurements ... it is evident that Winnemucca Lake has risen over 40 feet since 1872, and over 50 feet since 1867.

The history of the fluctuations of these lakes is supplemented and enlarged by the statements of Mr. George Frazier, who has been familiar with the region since 1862. In his judgment Winnemucca Lake has risen about 40 feet in the last twenty years. In 1862, the branch of the Truckee River that supplies Winnemucca Lake was so low that a person could cross it by stepping from stone to stone, at a point where it is now not less than 25 feet deep. The lake was then confined to the northern extremity of its basin, and the stream reached it after meandering through meadow lands that are now 15 or 20 feet under water. At that time the channel of the stream could be traced along the bottom of the lake for some distance, and dead cottonwood trees were standing in the water, showing that the lake had previously been much lower. Dead trees standing in Pyramid Lake, some distance from the shore, bore similar evidence to the rise of that lake

AMONG THE NEEDLES, PYRAMID LAKE, NEVADA.

previous to 1862. This lake, however, is thought by Mr. Frazier to be much higher at present than when he first saw it. During the spring and summer of 1868 the Truckee delivered more water than usual, and Pyramid Lake rose 10 or 15 feet. This rise continued throughout the following year, and during these two years Pyramid overflowed into Winnemucca Lake. The water in the "slough" at that time was brackish and unfit to drink. In the summer of 1876 all the water of the Truckee River emptied into Winnemucca Lake, its outlet into Pyramid Lake having been closed by a gravel bar; but the annual rise of the river the following spring removed the obstruction. These observations, although not of scientific accuracy, are yet of value, and have been confirmed by other people who have been acquainted with these lakes for a number of years.

We may note here that the rise of Pyramid and Winnemucca lakes during the last fifteen or twenty years is synchronous with a similar increase observed in Goose, Horse, and Mono lakes, California; Walker and Ruby lakes, Nevada; Great Salt and Rush lakes, Utah.

In determining future fluctuations of level in Pyramid and Winnemucca lakes, the accompanying map, Plate IX, may be considered as of approximate accuracy; the soundings, too, were made with care. Besides these data we have determined the elevation of certain points above the surface of the lake, which will serve as bench-marks for future measure-

FIG. 7.—Portion of the east shore of Pyramid Lake, showing position of measured rocks.

ments. In the southern end of Pyramid Lake, and to the eastward of the Truckee delta, rise a group of tufa crags, indicated on the map by the letters *x*, *y*, *z*. An enlarged plat of this portion of the lake shore is given in the accompanying figure. The height of these crags above the surface of

the lake, September 9, 1882, was as follows: x , 24.0 feet; y , 9.8 feet; z , 23.7 feet.

This record may be increased by adding the following elevations above the lake level as determined in September and October, 1882:²⁹

Summit of Anaho Island	517 feet
Summit of "Mushroom Rock," on the north shore of Anaho Island (see Plate XIV)	17 feet 3 inches
Rock to the south of Mushroom Rock (beneath bird on Plate XIV) .	8 feet 5 inches
Summit of Pyramid Island (Plate XI)	289 feet
Highest spire among The Needles (Plate XIII)	300 feet

HUMBOLDT LAKE.

Humboldt Lake is but an expansion of the river that supplies it, and is held in check by an immense gravel embankment that was thrown completely across the valley by the currents of the former lake, at one time 500 feet deep at this point. An accurate map of this structure is given on Plate XVIII, and a detailed description on page —. As there described, the embankment has been cut across by the overflow of the lake and the breach partially filled during the past few years by an artificial dam, which has greatly increased the area of the lake. During the dry season the lake seldom overflows and is then the limit of the great drainage system of the Humboldt River, but in winter and spring the waters escape southward, and spreading out on the desert form Mirage Lake. Farther southward on the northern part of the Carson Desert they again expand and contribute to the formation of North Carson Lake.

In the summer of 1882, Humboldt Lake covered an area of about 20 square miles, did not overflow, and although somewhat alkaline was inhabited by both fish and mollusks, and was sufficiently pure for human use. The following analysis of its waters by Prof. O. D. Allen, of Yale College, is taken from the reports of the United States Geological Exploration of the Fortieth Parallel, Vol. II, p. 743.

Phosphoric acid	0.00069
	0.92860
Less carbonic acid added to the amount found	0.04254
	0.88606

A series of soundings made in Humboldt Lake, in July, 1882, gave a nearly uniform depth of 12 feet for the central part. Near the western shore quite extensive mud-banks rise a few feet above the surface and nearly divide the lake; westward of these the water is still more shallow than in the main body. The lake is being rapidly filled by the silt from the Humboldt River, and is destined to early extinction.

Owing to the orographic structure of the valley it occupies, the eastern shore of the Humboldt Lake is bordered by a precipitous cliff of displacement, the western shore is low and marshy, in places covered with a saline efflorescence. A sample of the incrustation from the surface of the

desert near Brown's Station was found by Mr. R. W. Woodward to have the following composition:³⁰

Constituents.	Per cent.
Soluble in water	27.71
Chloride of sodium	49.67
Sulphate of soda	20.88
Sesquicarbonate of soda.....	18.15
Borate of soda	11.30
	100.00

NORTH CARSON LAKE.

This lake is situated on the northern part of the Carson Desert (see Plate VII) and receives its waters from both the Humboldt and the Carson rivers. Having no outlet, the waters flowing into it have been supposed to sink, and for this reason it is generally spoken of as the "Humboldt and Carson Sink." As this term is based on an error, we have used the name "North Carson Lake" instead.

During the winter and spring it receives a considerable supply of water from both the Humboldt and Carson rivers, and becomes a shallow playa-lake, between 20 and 25 miles in length, by 14 miles in breadth. In unusually arid summers the water supply fails, and the lake evaporates to dryness. As desiccation becomes more intense the salts impregnating the lake-beds are brought to the surface and form an efflorescence several inches in thickness.

This was the case when the Carson Desert was visited by the writer in October, 1881. The lake had then wholly evaporated, leaving a broad mud-plain covered in places with a white alkaline crust that looked like patches of snow.

SOUTH CARSON LAKE.

Situated on the southern border of the Carson Desert lies South Carson Lake. This, like the larger lake to the northward, is a playa-lake and occupies a very shallow depression in the lake-beds flooring the desert. Like other lakes of its class, it has indefinite boundaries and varies in size

³⁰ U. S. Geological Exploration of the Fortieth Parallel, Vol. II, p. 744.

and depth with the alternation of seasons. In 1882 its area was about 40 square miles, with a depth of four feet throughout its central portion. Its waters are alkaline, and contain 1.4725 grammes of solids in solution to the liter; of which 0.2135 gramme is silica, as reported by Prof. F. W. Clarke from a partial analysis of a sample collected in October, 1863.

The lake is supplied almost entirely by the Carson River and usually overflows through a slough into North Carson Lake.³¹

The low muddy shores are strewn with the dead shells of *Anodonta*, *Planorbis*, *Limnæa*, etc., but, so far as known, no mollusks are now living in the lake.

WALKER LAKE.

The southern extremity of the Lahontan basin is occupied by Walker Lake, which, next to Pyramid Lake, is the most picturesque and attractive of the desert lakes in the Lahontan basin.

A correct outline of the lake, as it existed in 1882, is given on Plate XV. As may be gathered from the map, the lake is 25.6 miles in its longer, or north and south axis, and has an average width of between 4.5 and 5 miles. Its area is 95 square miles. As on the map of Pyramid Lake, the actual soundings are given in figures, and the somewhat conjectural topography of the bottom is represented by dotted contour lines. Over a large area in the central and western portions it has a remarkably uniform depth of 224 feet; but as a rule the depth increases as one approaches the western shore, which is overshadowed by rugged mountains. The bottom throughout the central portions is composed of fine tenacious mud, which in many places is black in color, and has the odor of hydrogen sulphide. Coarser deposits, consisting of sand and gravel, mingled with the empty shells of *Pyrgula*, *Pompholyx*, etc., were found only in the immediate neighborhood of the shore. No mollusks were found living in the lake; but the conditions of environment being so similar to what has been observed in Pyramid Lake, it is thought that a more careful search would show that Walker Lake is also inhabited by a few species. Analyses of the water, collected in September, 1882, one foot and 215 feet below the surface

³¹ See *ante*, page 44.

where the depth was 224 feet, as shown on the accompanying map, are reported by Prof. F. W. Clarke as follows:

* 98.39 per cent. accounted for.

† 97.66 per cent. accounted for.

As in the case of the other lakes of the Great Basin, situated at an elevation of less than 5,000 feet, the shores of Walker Lake are totally lacking in arboreal vegetation except at the river mouth, and are clothed only with desert shrubs. At the northern end, and following the immediate shores of the Walker River for many miles, are luxuriant cottonwood groves, together with willow-banks and meadow-lands.

At the northern end, the river is building out a low delta of fine silt, and remnants of similar deltas, at higher levels, may be seen as one follows up the river. A change in the level of the lake is recorded by dead trees standing in the water, which show that it has risen at least four or five feet in recent years.

The waters at a distance from the river mouth are of a clear deep blue, changing to a bright green tint near the shore, as in Pyramid Lake. They are charged with saline matter to such an extent that carbonate of lime is now being deposited. The calcareous tufa now forming cements the gravel and sands of the shore into compact strata or forms rosette shaped masses, with isolated pebbles for nuclei.

WALKER LAKE, NEVADA

I. O. Russell, Geologist.

WALKER LAKE, HISTORY OF LAKE LAHONTAN.

The following data, as shown on the accompanying map, are re-
sults of the analysis of the water as follows:

Constituents.	Probable com- bination (ex- pressed in grammes per liter).

* 92.35 per cent. accounted for.

† 97.66 per cent. accounted for.

As in the case of the other lakes of the Great Basin, situated at an ele-
vation of less than 5,000 feet, the shores of Walker Lake are totally lacking
in arboreal vegetation except at the river mouth, and are clothed only with
desert shrubs. At the northern end, and following the immediate shores of
the Walker River for many miles, are luxuriant cottonwood groves, to-
gether with willow-banks and meadow-lands.

At the northern end, the river is building out a low delta of fine silt,
and remnants of similar deltas, at higher levels, may be seen as one follows
up the river. A change in the level of the lake is recorded by dead trees
standing in the water, which show that it has risen at least four or five feet
in recent years.

The waters at a distance from the river mouth are of a clear deep blue,
changing to a bright green tint near the shore, as in Pyramid Lake. They
are charged with saline matter to such an extent that carbonate of lime is
now being deposited. The calcareous tufa now forming cements the gravel
and sands of the shore into compact strata or forms rosette-shaped masses,
with isolated pebbles for nuclei.

In the study of the recent and fossil lakes of the Far West it is frequently desirable to know the present rate of evaporation, and the character of the seasonal and secular variations in precipitation that are taking place. Attempts have been made to determine the rate of evaporation by experimenting with artificial evaporating pans, but owing to the difficulty of imitating the conditions of nature, these observations have been of little value. Gauges have been established in Great Salt Lake, and accurate records of its annual and secular fluctuations have been secured for a number of years, but in this instance the variations of the lake are influenced by irrigation, and the sources of supply for the waters of the lake are too numerous to be definitely measured. Of all the lakes of the Far West with which we are acquainted, excepting Abert Lake, Oregon, the most favorable for determining the questions indicated above is Walker Lake. As this lake receives its entire supply from a single source and is without outlet, the rate of evaporation from a large water surface could be determined with great accuracy. Observations intended to show the secular variations in precipitation would be more difficult because the waters of Walker River are largely used for irrigation.

LAKE TAHOE.

As Lake Tahoe is the grandest of the Sierra Nevada lakes, and the largest that discharged into Lake Lahontan, we insert a brief account of it, compiled principally from the investigations of Prof. John Le Conte, of the University of California.³²

The lake is situated in latitude 39° N., and lies part in California and part in Nevada, at an elevation of 6,247 feet, as determined by railroad surveys. Its drainage area, including the lake surface, is about 500 square miles. The water surface is 21.6 miles long from north to south, with an extreme breadth of 12 miles; its area being between 192 and 195 square miles. Its outlet is the Truckee River, which leaves the lake through a magnificent gorge, at a point on its northwestern shore.

³² "Physical Studies of Lake Tahoe," published in the Free Press and the Mining and Scientific Press of San Francisco, during 1880 and 1881. Reprinted in the Overland Monthly for November and December, 1883, and January, 1884.

Soundings made by Professor Le Conte, beginning at the northern end, near the "Lake House," and advancing along the longer axis of the lake directly north towards the "Hot Springs," at the northern end, give depths of from 900 to 1,645 feet.

Between the 11th and the 18th of August, 1873, Professor Le Conte made a large number of temperature measurements at different depths in the lake, an abstract of which is here copied:

No.	Depth in feet.	Depth in meters.	Temperature: Fahr.	Temperature: Cent.
1 (surface).			67	19.44
2.....	50	15.24	63	17.22
3.....	100	30.48	55	12.78
4.....	150	45.72	50	10.00
5.....	200	60.96	48	8.89
6.....	250	76.20	47	8.33
7.....	300	91.44	46	7.78
8 (bottom).	330	100.58	45.5	7.50
9.....	400	121.92	45	7.22
10.....	480	146.30	44.5	6.94
11 (bottom).	500	152.40	44	6.67
12.....	600	182.88	43	6.11
13 (bottom).	772	235.30	41	5.00
14 (bottom).	1,506	459.02	39.2	4.00

Professor Le Conte's paper also contains many valuable observations on the transparency and color of the lake water, and on rhythmic variations of level. An analysis of the water of Lake Tahoe has already been given on page 42.

Besides Lake Tahoe, there was another lake among the mountains of Northern California during Quaternary times which was tributary to Lake Lahontan. This was a comparatively shallow water body that occupied the basin now known as the Madeline Plains. A small stream from Horse Lake Valley joined that draining the Madeline Plains; as did also the waters escaping from Eagle Lake, which, without evidence to the contrary, we may consider to have discharged then as now, through beds of gravel beneath a lava coulée.

SODA LAKES, NEAR RAGTOWN, NEVADA.

On the Carson Desert, about 2 miles northeast of Ragtown, are two circular depressions that are partially filled with strongly alkaline waters and known as the Soda Lakes or Ragtown Ponds. By reference to the accompanying map (Plate XVI), on which the contour lines are drawn at intervals of 20 feet, it will be seen that the lakes occupy deep depressions in low cones. The larger lake is 268.5 acres in area, and the smaller is a pond of variable size.³³ The form of the larger depression is still farther illustrated by the cross-section given at the bottom of the plate, which has been constructed from actual measurements with an engineer's level and a sounding line. The rim of the larger lake in its highest part rises 80 feet above the surrounding desert, and is 165 feet higher than the surface of the lake which it incloses. The outer slope of the cone is gentle and merges almost imperceptibly with the desert surface; but the inner slope is abrupt and at times approaches the perpendicular. A series of careful soundings gives 147 feet as the greatest depth of the lake. The total depth of the depression is therefore 312 feet, and its bottom is 232 feet lower than the general surface of the desert near at hand.

The walls encircling the lake exhibit well exposed sections of stratified lapilli, mingled with an abundance of angular grains, kernels, and masses of basalt, some of which are 2 and 3 feet in diameter and scoriaceous, especially in the interior. Mingled with this angular and rough material is a great quantity of fine dust-like lapilli, and some rounded and worn pebbles of rhyolite. Interstratified with the lapilli occur marly lake-beds containing fresh-water shells and dendritic tufa, as is indicated in the accompanied generalized section of the crater walls (Plate XVII, Fig. A). Both the lapilli and the lake-beds are evenly stratified, and exhibit diverse dips. On the interior of the larger crater, on the south side, the dip is towards the lake at an angle of about 30° . On the east side the stratification appears quite horizontal, but may, perhaps, be inclined away from

³³ The smaller lake, when the accompanying map was made, had been so changed by excavation and the construction of evaporating vats that its original form had been destroyed. Its surface is 20 feet higher than the larger lake, and 65 feet below the general desert surface. The highest point on the crater rim is 80 feet above the bottom of the depression.

the crater; near the surface of the lake there are two planes of unconformability, as well as a number of small faults. In the crater walls on the opposite side of the lake a number of displacements may be seen, as indicated in Fig. E, Plate XVII.

The form of the cones and the nature of the material of which they are composed leave no doubt that these are crater-rings, *i. e.*, low cones of eruption containing large craters. The evidence sustaining this conclusion is abundant. In the stratified beds of yellowish lapilli, which are always angular and sometimes as fine as dust, are many fragments of basalt, rhyolite, and masses of hardened lake-beds,³⁴ that are evidently ejected fragments that have been dropped from a considerable height to the positions which they now occupy. The strata of lapilli beneath these "bombs" are bent down, as shown in the accompanying sketch (Figs. B, C, and D, Plate XVII) the disturbance being visible for 6 or 8 inches below the included rock. The strata of loose cinders covering the inclosed fragments are horizontal and undisturbed. That the cones were not formed during a single eruption, but have a long and complicated history, and are perhaps sublacustrine in their origin, is shown by the alternation of ejected and sedimentary materials in the crater walls.

From the presence of fossiliferous lacustral clays in the midst of lapilli, it seems evident that volcanic eruption was interrupted by periods during which the lake covered the craters. The presence of dendritic tufa in the midst of the section proves that the volcano was active both before and after the dendritic stage of Lake Lahontan. The wall of the larger lake is somewhat open on the south side, while the western rim has been prolonged southward (see Plate XVI) in such a manner as to suggest that the erupted material was in part removed by currents at the time it was ejected and deposited in the form of an embankment, connecting with the crater rim.

The hypothesis that the craters were formed by the action of extremely powerful sublacustrine springs, as advanced by King,³⁵ would not account for the nature of the material forming the crater walls, nor the presence of

³⁴ The rhyolite pebbles and fragments of lacustral sediments thrown out by this volcano were evidently derived from the superficial strata through which it opened a passage. The basalt, on the other hand was erupted in a semi-fused condition and formed slaggy masses on cooling.

³⁵ U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 512.

THE CRATER RINGS OF LAKE LAHONTAN.

There are two planes of unconformity in the strata of the lake. In the crater walls on the south side of the lake, evidence of replacements may be seen, as indicated on Plate XVI.

The nature of the material of which they are composed is evident from the crater rings, i. e., low cones of eruption. The evidence sustaining this conclusion is the presence of yellowish lapilli, which are always associated with the bombs. There are many fragments of basalt, rhyolite, and lacustrine sediments that are evidently ejected fragments from a considerable height to the positions where they are now found. The strata of lapilli beneath these "bombs" are shown in the accompanying sketch (Figs. B, C, and D, Plate XVI). These strata are for 6 or 8 inches below the included fragments. The fragments covering the inclosed fragments are of a different nature. Thus the cones were not formed during a single eruption, but have a long and complicated history, and are perhaps the result of the alternation of ejected and deposited material.

The presence of lacustrine clays in the midst of lapilli, and the fact that the eruption was interrupted by periods during which the lake was at its normal level, prove that the volcano was active both before and after the formation of Lake Lahontan. The wall of the larger lake is somewhat higher on the south side, while the western rim has been prolonged in such a manner as to suggest that the erupted material was in part removed by currents at the time it was ejected and deposited in the form of an embankment, connecting with the crater rim.

The hypothesis that the craters were formed by the action of extremely powerful subterranean springs, as advanced by King,²⁵ would not account for the nature of the material forming the crater walls, nor the presence of

²⁵The rhyolite pebbles and fragments of lacustrine sediments thrown out by this volcano were evidently derived from the superficial strata through which it opened a passage. The basalt, on the other hand, was erupted in a semi-fused condition and formed slaggy masses on cooling.

the numerous volcanic bombs that depress the strata on which they rest. If the cavities owed their origin to springs of very great magnitude rising in the bottom of Lake Lahontan, it is evident that the out-flowing waters would have cut channels of overflow when the lake evaporated to a horizon below the rim of unconsolidated material that surrounded them; but the crater walls are now continuous and unbroken by stream channels. On the other hand, had the springs become extinct before the evaporation of the lake the cavities they formerly occupied would be buried beneath lake-beds. This, as our observations show, is not the case, but both the inner and outer surfaces of the cones are free from lake sediments. The last addition of lapilli to the walls of the crater must have been of post-Lahontan date.

The least diameter of the larger crater at the water surface is 3,168, and its greater 4,224 feet. Its area, as stated on a previous page, is 268.5 acres. A sublacustral spring of these dimensions, rising with sufficient force to carry blocks of basalt 1 or 2 feet in diameter to the height of 150 feet, would be a phenomenon without parallel. That the lakes occupy extinct craters is recognized by Mr. Arnold Hague in his description of the Carson Desert.³⁶

There are no streams either tributary to or draining these lakes; their total water supply, excepting the small amount derived from direct precipitation, is supplied from subterranean sources. Around the immediate shores of the larger lake there are a number of fresh-water springs; the largest of these is situated on the northern border of the basin, and issues from a small fault at an elevation of about 15 feet above the water surface. As the lake, by aneroid measurements, is 50 feet below the level of the Carson River at its nearest point, we may safely look to this stream as the probable source of the water supply which reaches the craters by percolating through the intervening marls and lapilli deposits. The bottom of the lake, as determined by many soundings, is a continuation of the slope of the inner walls of the crater, excepting that the conical form has been modified by shore action and sedimentation, which has resulted in the formation of the terrace about the present water margin. In the northern part of the lake a reef of rock projects above the surface, and soundings show that this is continuous from

³⁶ U. S. Geological Exploration Fortieth Parallel, Vol. II, p. 746.

shore to shore, thus indicating that two craters are combined in the formation of the present depression.

The bottom, as shown by the samples obtained by the cup at the end of our sounding lead, is a fine tenacious black mud having a strong odor of sulphuretted hydrogen. When exposed to the air for some time this material loses its inky color and shows itself to be of the same nature as the fine dust-like lapilli that form a large part of the crater walls. The organic matter impregnating these sediments is evidently derived from the millions of brine shrimps (*Artemia gracilis*) and the larvæ of black flies that swarm in the dense alkaline waters.

Near the shore the rock and pebbles, as well as bits of organic matter are coated with beautiful crystals of gaylussite which form about any solid nucleus that chances to be available. The crystals are white, with transparent edges, monoclinic in form, and thin in the direction of the orthodiagonal, as illustrated by Figure 607, Dana's System of Mineralogy, 5th edition. The small island in the northern part of the lake is completely coated with gaylussite crystals and trona. An analysis of a crystal of gay-lussite from this locality by Prof. O. D. Allen gave the following composition:³⁷

Lime	19.19
Soda	19.95
Carbonic acid	29.55
Water	31.05
Sulphuric acid	Trace.
Chlorine	Trace.
Insoluble residue	0.20
	99.94

Trona also occurs along the shore of the lake up to an elevation of 10 or 12 feet, and not unfrequently contains casts of the larval cases of a fly which now lives in the lake in immense numbers. An analysis of a sample of trona from this locality, by Prof. O. D. Allen is here copied.³⁸

A water sample collected from the south side of the lake in August, 1867, and analyzed by Prof. O. D. Allen, had a specific quantity of 1.0975, and gave a fixed residue of 114.7 parts per thousand, and on spectroscopic examination was found to contain lithia in addition to the elements given in the above analyses.³⁹

In obtaining carbonate of soda from the waters of the larger lake two methods are in use. One is known as the "cold weather" and the other as the "warm weather" process. In the former the water of the lake is conducted into vats along its shore, and has a density of about 12° of Beaumé's areometer. As it evaporates beneath the heat of the summer sun its density increases until it approaches 30° B. At this point more water is added from the lake. This process is continued until cold weather approaches; the vats are then so adjusted as to have a density approaching 30° B. The lowering of the temperature on the approach of winter causes sodium carbonate and sodium sulphate to be precipitated at the bottom of the vats in a hard crystalline layer, which, when removed to the drying sheds, crumbles to a fine white powder. The "soda" formed by this process contains about equal portions of sulphate and carbonate, as shown by the following analysis by Dr. F. W. Taylor of a sample of the material as it is sent to the market:

	Per cent.
Silica	0.449
Iron and aluminum	.011
Calcium sulphate	.038
Magnesium sulphate	.040
Sodium chloride	2.193
Sodium sulphate	49.437
Sodium carbonate	40.714
Water	7.118
	100.000

While concentrating the waters in the soda vats during the summer, if the density increases beyond about 30° B, carbonate of soda and sulphate of soda are precipitated, and, if concentration continues, is soon followed by the deposition of common salt. In this process the water is conducted from vat to vat, becoming gradually concentrated as it progresses. When in the last

³⁹ U. S. Geological Exploration of the Fortieth Parallel, Vol. II, p. 747.

of the series it has reached the desired density, sodium carbonate, together with sodium sulphate, is deposited. The mother liquor is afterward returned to the lake. The soda thus obtained is called "summer soda," and has about the composition given in the above analysis, as is indicated by qualitative tests. The vats in which the evaporation is conducted are formed by levees built along the shallow border of the lake, and are usually about 80 feet long by 50 feet broad; the water when evaporation commences is usually from 12 to 14 inches deep. (Plate XVI.)

When the waters of the lake are evaporated until a density of about 15° B. is reached, they assume a reddish tint, which increases as the concentration is carried forward, until at 30° B. they become of a bright cherry-red color. Chemical tests show that this color is not due to the presence of manganese or iron, but is probably produced by organic substances.

The manufacture of soda at the larger lake was commenced in 1875, and is yet in its experimental stage, although two or three hundred tons of impure soda carbonate have been produced. The smaller lake when first discovered is reported to have been dry, and presented the appearance of an ordinary mud-playa. Excavations carried to the depth of about 25 feet have shown that the material filling the basin is composed of layers of soda salts, separated by strata of dust and mud. As the layers of soda in these beds have the character of the "summer soda" now formed in the vats, it is evident that the crater has served as a natural evaporating pan, in which the water accumulated during the wet season was entirely evaporated before the dry season had passed.

For the manufacture of soda in this basin, vats have been excavated in the material composing its bottom. They are filled by water seeping from its sides, which, as it enters the vats, has a density of from 10° to 15° B. Concentration is carried on until the carbonate of soda begins to crystallize, when a new supply of brine is added, and the process carried forward until cold weather sets in, when an abundant crop of beautiful soda crystals is formed during the first cold nights of autumn. After all the soda is precipitated that a lowering of temperature will produce, the mother liquor is conducted back into lower depressions, and allowed to leach through the soda-bearing strata once more. The crust of soda obtained at the bottom

of the vats is usually about 10 inches thick and shows two divisions, the upper layer, or "winter soda," being the more crystalline. The salt thus obtained is removed to drying sheds, where it loses its excess of water, at the same time crumbling to a fine powder, and is then ready for the market. A sample of this material was found on qualitative examination to consist principally of sodium carbonate, together with considerable quantities of chloride and sulphate of soda, and traces of phosphoric and boracic acid and potash.

The manufacture of soda in the smaller pond has been carried on for about eighteen years, with an annual production of between four and five hundred tons, as I am informed by Mr. B. F. Gray, the present superintendent.

The walls of the smaller crater are of the same nature as those that surround the larger lake, and exhibit sections of stratified tuff containing ejected blocks of basalt that depress the strata on which they rest. An illustration of the smaller Soda Lake will be found on Plate XXII, Vol. II, and of the larger lake on Plate XXVI of Vol. I, of the reports of the U. S. Geological Exploration of the Fortieth Parallel.

The mineral matter now dissolved in the water of the Soda Lakes is unquestionably derived from the springs that supply them, and has been dissolved from the lacustral beds and lapilli deposits through which their waters percolate during their subterranean passage.

The data given on Plate XVI enable one to calculate approximately the volume of the larger of the Soda Lakes; and from the analyses of its waters that have been made we can determine the quantity of the various salts it contains. Making these calculations for the salts of greatest economic importance, we find that the lake contains nearly 428,000 tons of sodium carbonate; sodium sulphate amounts to nearly four-fifths of this quantity; while the sodium chloride is somewhat less than three times as great. The total of all salts dissolved in the lake is in the neighborhood of two million tons.

PLAYA-LAKES AND PLAYAS.

The name "playa-lake" has been applied to inclosed water bodies of dry climates which have little depth and frequently evaporate to dryness, leaving mud-plains, or playas. In the typical examples found throughout the Great Basin, their waters are somewhat alkaline and saline, and almost always turbid with fine silt, and, probably, chemical precipitates. This material is retained in suspension not only because the shallow lakes are frequently agitated to the bottom by the wind, but, also, for the reason that in waters containing alkaline salts the precipitation of suspended matter is greatly retarded. Lakes of this class exhibit great variety, and are the most irregular of water bodies. In many instances they hold their integrity for a number of years, and only evaporate to dryness during exceptionally arid seasons. Again, desiccation is apparently the normal condition, and the basins are only flooded during times of unusual humidity. Many lakes of this class exist only during the humid season, and are dry throughout the summer. In the spring and fall, as already mentioned in describing the general features of the Great Basin, they appear with every storm that gathers and vanish when the heavens are again bright. Their outlines consequently fluctuate with the humidity of the season, and, owing to the extreme shallowness of their basins, a variation of an inch or two in depth may make a difference of many square miles in area.

Examples of the more permanent playa-lakes of the Lahontan basin are furnished by Honey Lake and the lakes of the Carson Desert. Another, of less permanence, on the Black Rock Desert, has been noticed on page 10. The positions of others, some of which are many miles in extent during the winter, but disappear completely when the breath of summer touches them, are indicated on the accompanying pocket-map. Examples might be multiplied, and the curious effects that these ephemeral lakes exert on the scenery of arid lands might be dwelt upon, but this would perhaps carry us beyond their geological interest.

The lakes described above are commonly uninhabited by fish, but frequently afford a congenial abode for mollusks, especially for the *Limnæidæ* and allied forms.

The water reaching playa-lakes is commonly derived from the surface drainage of the basins in which they occur; the larger ones, however, are supplied by streams more or less permanent. The sediment contributed to lakes of this description is commonly in a state of minute subdivision, and when derived from the surrounding surface is rich in saline matter. When evaporation takes place both the suspended and dissolved matter is deposited and forms a peculiar light-colored saline clay, which, when desiccation is complete, forms a smooth mud-plain, or playa.

The mud-plains originating in the manner described above are characterized by the evenness of their surfaces and their light creamy-yellow color, which is independent of the nature of the surrounding rocks. These deposits have the same characteristics and apparently about the same composition whether surrounded by sedimentary rhyolites or basaltic rocks. In area they vary from a fraction of an acre up to many square miles. They are entirely destitute of vegetation, and are in fact the only absolute deserts in this country. During the rainy season they are rendered soft and impassable, and very frequently covered with water, as mentioned in describing a playa-lake, but with the advance of summer they lose their moisture and become so completely desiccated beneath the intense heat of the summer's sun that they resemble a pavement of cream-colored marble, which, on the broader deserts, stretches away to the horizon without a shrub or spear of grass to break the monotony of the glossy surface. Owing to the contraction of the mud on drying a playa becomes broken by a vast system of intersecting "sun cracks," which frequently cover the surface with an intricate network of narrow fissures. While the mud is soft it sometimes becomes impressed with the foot-prints of animals and rippled by the winds, thus receiving markings that are usually considered characteristic of shores.

Typical examples of playas of broad extent occur in the Lahontan basin, on the Black Rock, Smoke Creek, and Carson deserts; others of less size are met with in various minor basins, as has been indicated in describing playa-lakes.

The scenery on the larger playas is peculiar, and usually desolate in the extreme, but yet is not without its charms. In crossing these wastes the traveler may ride for many miles over a perfectly level floor, with an

unbroken sky-line before him, and not an object in sight to cast a shadow on the ocean-like expanse. Mirages may be seen every day on these heated deserts. Similar optical illusions give strange fanciful forms to the mountains, and sometimes transfigure them beyond all recognition. At such times a pack-train crossing the desert a few miles distant frequently appears like some strange caravan of grotesque beasts fording a shallow lake, the shores of which advance as one rides away. The monotony of midday on the desert is thus broken by delusive forms that are ever changing, and suggest a thousand fancies which divert the attention from the fatigues of the journey. The cool evenings and mornings in these arid regions, when the purple shadows of distant mountains are thrown across the plain, have a charm that is unknown beneath more humid skies. The profound stillness of the night in these solitudes is always impressive.

When the heat of summer drives every drop of moisture from these deserts a white saline efflorescence appears, which is formed by the crystallization of various salts brought to the surface in solution by the action of capillary attraction, and left as the water that dissolved them is evaporated. Incrustations of this nature sometimes cover areas many miles in extent, especially along the borders of the playas, and render the surface as dazzling as if covered by snow.

An analysis of a typical specimen of playa mud from the southern part of the Carson Desert is reported by Dr. F. W. Taylor, as follows:

Portion soluble in water 15.16 per cent.

Constituents.	Soluble portion.	Constituents.	Insoluble portion.
	<i>Per cent.</i>		<i>Per cent.</i>
Silica	14.05	Silica	48.33
Iron sesquioxide	2.37	Iron sesquioxide	3.93
Alumina	2.17	Alumina	14.36
Magnesium carbonate	2.90	Lime (CaO)	11.23
Calcium carbonate	0.79	Magnesia (MgO)	2.82
Sodium carbonate	14.36	Soda	5.00
Sodium sulphate	4.28	Potassa	2.58
Sodium chloride	53.16	Carbonic acid	6.88
Water (by difference)	5.92	Water	4.55
	100.00		99.68

An examination of a sample from another playa gave less than 3 per cent. soluble in water, consisting principally of sodium carbonate, calcium carbonate, and common salt.

It is not to be expected that all deposits of this character would have even approximately the same composition, but the conclusion arrived at in the field, that they are the result of both mechanical and chemical processes, is strengthened by the analyses that have been made. In some instances easily soluble salts form a large percentage of the deposit, which then becomes a salt-field, a bed of gypsum, or is largely composed of other similar salts. At times these deposits become covered with mechanical sediments, and perhaps buried so deeply that they are not again dissolved when the basin is reoccupied by a lake. All stages in this process, which, in fact, is the closing chapter in the history of many lakes, may be observed in the arid region of the Far West.

Playas in which the mechanical deposits greatly predominate are the most common, and may be studied in a large number of the desert-valleys of Utah and Nevada. Examples of salt-playas are numerous, especially in Southern Nevada, where they are of economic importance, and, besides common salt, frequently contain large quantities of sodium sulphate and carbonate, borax, etc. In some instances the lower portions of earthy playas are saturated with brine—as is the case in Diamond Valley, Nevada—which, when raised to the surface and evaporated, is capable of supplying an almost unlimited quantity of salt. One of the most instructive playas in the Great Basin is situated in Utah, a few miles southward of Fillmore. In this instance the water entering the basin and partially flooding it during the rainy seasons is probably charged with calcium sulphate in excess of all other salts, and on evaporating leaves a deposit of crystallized gypsum, or selenite, which is now approximately 12 square miles in extent, and has been penetrated to the depth of 6 feet without revealing its entire thickness. The salts more soluble than gypsum, which must have been deposited by the waters covering the playa at various times, have apparently been flooded out by an overflow of the basin, thus leaving the selenite in a remarkably pure condition. The small crystals of selenite swept from the surface of the deposit by the wind have been accumulated in im-

mense dunes, especially along the northern border of the playa, and have nearly buried a rhyolitic butte beneath snow white drifts, thus acquiring for it the local name of the "White Mountain."

A stratification of the various salts found in playas in the order of their solubility, as commonly occurs from the slow evaporation of brines, is not usual, for the reason, apparently, that they owe their accumulation to repeated desiccations. In some instances, however, as at Rhode's salt marsh in Nevada, the more soluble salts are gathered most abundantly in the central part of the basin.

A study of the playas of the Far West renders it evident that saline deposits of great extent may result in the manner described above, and sustains the suggestion that beds of rock-salt, gypsum, etc., found in various geological formations may have been accumulated in interior basins by the evaporation of ordinary surface waters, and are not in all cases, as frequently inferred, the result of the evaporation of isolated bodies of seawater.

Besides the playas proper, the formation and characteristics of which we have sketched, there are other desert areas in the Far West that are frequently designated by the same name, but which are of a somewhat different nature. These are mud-plains left by the evaporation of large lakes, and composed of ordinary lake sediments. Deserts of this nature are in many instances nearly as desolate as the true playas. Their borders are commonly poorly defined, being more or less covered with shrubs; their surfaces, too, are commonly uneven and irregular. In substance, they are usually composed of tenacious greenish clay of the same character as the sediments now forming in many large lakes. Usually the deserts of this character occupy nearly the entire breadth of an ancient lake-bed, and are overlaid by playas proper in their lowest depressions. In a deep section of such a playa the light-colored saline clays, of which they are almost invariably composed, would be found to pass into the more tenacious and darker clays beneath. The strata at the base of such a section were deposited in a deep lake of broad extent, while the playa-beds proper are the record of frequent desiccations.

The freshening of lakes by complete evaporation is one of the most interesting results of the processes we have been tracing. Perhaps the strongest proof that the burial of desiccation products beneath earthy sediments is competent to convert a lake from a saline to a fresh condition is furnished by a number of the existing lakes of Nevada and Oregon, which are either fresh to the taste, or else hold but a fraction of 1 per cent. of saline matter in solution, but occur in comparatively broad drainage-basins that have not overflowed since the beginning of the Quaternary. This is illustrated especially by the present condition of the lakes of the Lahontan basin, as will be shown in treating the chemistry of the former lake (*postea*, page 229).

CHAPTER IV.

PHYSICAL HISTORY OF LAKE LAHONTAN.

SECTION 1.—SHORE PHENOMENA IN GENERAL.

The examination of the shores of recent and fossil lakes has shown that there are a number of characteristic topographic features, resulting from the action of waves and currents, which are of geological interest, and frequently enable one to determine much of the history of a lake that has passed away. The dynamics of lake waters may be studied in any existing lake, but the topography of shores is best seen in lake basins that have been emptied of their waters at a recent date.

If we stand on a shelving lake shore during a gale that is blowing landward, and watch the waves breaking on the beach, it will be noticed that they apparently become accelerated on entering shallow water, and, as their crests break into foam, they rush up the beach or shore-terrace, carrying stones and pebbles with them. As each wave retires we may hear the sharp rattle of this material, even above the roar of the waters, as it rolls and slides down the beach, only to be caught up by the next inrush, and the process repeated again and again. Outside the line of foam fringing the shore the water is frequently discolored, perhaps for several rods, by suspended sediment derived from the comminution of shore *débris*; farther lakeward the waves are clear and blue, or perhaps streaked with long lines of foam. The most superficial observations tend to assure us that vast quantities of stones, pebbles, sand, and silt are constantly carried up and down lake beaches and become rounded and smoothed by the process. This conclusion is also sustained by the worn appearance of the *débris* on

every shore. A little attention also enables one to ascertain that the beach material greatly assists the waves in cutting away the coast so as to form terraces and sea-cliffs, and is subsequently utilized in building bars and embankments. The modifications of lake shores due to chemical action need not receive attention at this time.

The principal features entering into shore topography are terraces, sea-cliffs, bars, embankments, and deltas. These, as will be shown below, result from the action of waves and currents on the shores that confine them, and differ so widely from the topographic forms produced by sub-aerial erosion and other geological agencies that the nature of their origin may be determined at a glance.

TERRACES.

The most characteristic forms resulting directly from wave action are sloping terraces bounded by a steep scarp, termed a sea-cliff, on the landward margin, and a second scarp, less abrupt, on the lakeward border. These forms are illustrated in the following diagram, which represents the profile of a lake shore so carved by waves as to form a cut-terrace and sea-cliff. The line *ab* represents the original slope of the shore before its modification by waves; *ac* the profile of the sloping terrace; and *cb* the sea-cliff.

FIG. 8.—Ideal profile of a cut-terrace.

In the desiccated lake basins of Utah and Nevada terraces of this nature frequently occur that are hundreds of feet in breadth and overshadowed by cliffs which at times are a thousand feet high.

The material derived from the formation of a cut-terrace at first encumbers the shelf formed, but is soon removed by the waves and currents and its place supplied by fresh *débris*. The finest of the waste from the land is carried lakeward by the undertow and finally deposited as lacustral beds;

portions less finely comminuted fall on the outer slopes of the terrace and serve to broaden it. The coarsest of all the shore *débris* usually remains on the terrace and is swept along by the currents until it finds a resting-place in some embankment or wave-built bar. The portion falling on the outer margin of the terrace is frequently consolidated by the precipitation of calcium carbonate in its interstices, thus forming a conglomerate, which adds to the breadth of the structure. In this manner a terrace may become in part a work of destruction and in part a work of construction, as indicated in the following diagram, which represents a cut-terrace, as in the last figure, with the addition of an accumulation of *débris* on its outer slope.

FIG. 9.—Ideal profile of a cut-and-built terrace.

Observations have shown that this is the most characteristic form of lake terrace, and illustrates the fact that the action of waves and currents in modifying shores may be divided into erosion and deposition, or the processes of destruction and construction.

SEA-CLIFFS.

The steep scarps rising above terraces are termed sea-cliffs, whether formed on lake or ocean shores. They occur especially where the borders of a lake are abrupt; but when the bluffs approach the perpendicular and form cliffs with deeply submerged bases, the action of the waves in carving terraces is reduced to a minimum, for the reason that the shore *débris* falls into deep water beyond the reach of the waves and can no longer be used as a tool in cutting away the land. On the other hand, sea-cliffs are seldom formed when the slope of the beach is very gentle. In such localities the waves lose their force before reaching the land, and deposition rather than erosion takes place. Sea-cliffs are most pronounced in rocks of heterogeneous composition, which are easily eroded, but yet sufficiently durable to stand in perpendicular escarpments.

BARS.

In the illustrations given above the effects of waves that result from winds blowing directly on-shore are alone considered. When the wind blows obliquely to the beach we have another modification of wave action. Currents are established in each instance by the friction of the wind on the water, but in the first they are at right angles to the beach and return lake-wards as an undertow; in the second case, however, *i. e.*, when the wind blows obliquely to the land, the currents formed move more or less nearly parallel with the shore, as may be illustrated along any lake margin by placing floats in the water or by watching the movements of the shore-drift. It will require but little attention to assure one that during a gale strong currents are thus established along lake margins, which in some respects are similar to the flow of rivers. They carry with them a band of shore-drift, consisting of sand, gravel, bowlders, etc., the width of which depends mainly on the slope of the shore and the character of the material moved. As in the flow of streams, the transported material is carried partly in suspension and partly by rolling along the bottom. The upward wave movements tend to lift the stones and the onward movement to carry them forward. When the force of the current is checked the coarser *débris* is first deposited and the finer transported to greater distances. The movement of such current-borne streams of *débris* along a lake shore necessitates friction, which results in the comminution of the *débris* itself and the abrasion of the base of the sea-cliff against which it impinges. Shore currents are even more powerful than on-shore waves as agents of erosion, but their distinctive property is the power to transport shore-drift. In this manner the *débris* supplied by the sapping of sea-cliffs is removed and formed into new structures at the same time that it causes the detachment of fresh material from the shore, thus supplying fresh tools with the aid of which the waves remodel their boundaries.

Shore currents are usually strongest at some distance from the actual lake margin. In some instances this distance amounts to several rods or perhaps half a mile. As the maximum transportation takes place where the current is most rapid, the result is the formation of a ridge of gravel in the path of the current. Deposits of this nature are molded by the waves

into long, narrow, level-topped ridges, with rounded crests, which follow the broader curves but not the minor irregularities of lake shores. They are composed of water-worn *débris* which has been assorted by currents, and when exposed in cross-section they present an irregular anticlinal of deposition. Gravel ridges of this nature have received the name of *barrier-bars*.

The altitude of the horizontal crest of a barrier bar is determined by the storm limit of the waves and currents that built it. Each such structure therefore furnishes a record of the horizon of the water's surface in which it was formed. Should a lake vary in level, it is evident that barrier bars may be constructed at many different altitudes. In the desiccated lake basins of Utah and Nevada bars of this nature frequently occur in concentric and symmetrically curved ridges, which may be followed for miles and sometimes furnish natural highways of a most excellent character.

An ideal plat of an arm of an ancient lake in which barrier bars were formed at three different levels is given in the following figure. Below

FIG. 10.—Ideal plat and section illustrating the formation of barrier bars.

the sketch is a section through the valley on the line xy , in which the level of the surface of the lake at the time the various bars were formed is indicated by dotted lines.

The conditions most favorable for the formation of barrier bars obtain when shelving shores occur adjacent to steep banks where sea-cliffs are forming; in such instances the *débris* derived from the sapping of the sea-cliff is swept along by shore currents, and furnishes the material for works of construction.

Sometimes a current is deflected from the shore and returns to it at another point. In this manner a looped bar inclosing a lagoon is formed. The lakeward portion of such a bar sometimes forms a definite angle; the structure then becomes V-shaped, and is known as V-bar. Bars with this peculiar form are not uncommon, and sometimes obtain great magnitude. It frequently appears as if structures of this nature had been begun in a rising lake, and that the forms of the shore deposits first made were retained and carried upwards as the lake rose, by the addition of fresh material to their surfaces. Barrier bars present other variations, some of which will be noted in the succeeding pages, which may frequently be seen in process of formation on the shores of existing lakes.

Bars of another character are also formed along lake margins, at some distance from the land, which agree in many ways with true barrier bars, but differ in being composed of homogeneous, fine material, usually sand, and in not reaching the lake surface.

The character of structures of this nature may be studied about the shores of Lake Michigan, where they can be traced continuously for hundreds of miles. There are usually two, but occasionally three, distinct sand ridges; the first being about 200 feet from the land, the second 75 or 100 feet beyond the first, and the third, when present, about as far from the second as the second is from the first. Soundings on these ridges show that the first has about 8 feet of water over it, and the second usually about 12; between, the depth is from 10 to 14 feet. From many commanding points, as the summit of Sleeping Bear Bluff, for example, these submerged ridges may be traced distinctly for many miles. They follow all the main curves of the shore, without changing their character or having their continuity broken. They occur in bays as well as about the bases of promontories, and are always composed of clean homogeneous sand,

although the adjacent beach may be composed of gravel and boulders. They are not shore ridges submerged by a rise of the lake, for the reason that they are in harmony with existing conditions, and are not being eroded or becoming covered with lacustral sediments.

In bars of this character the fine *débris* arising from the comminution of shore drift appears to be accumulated in ridges along the line where the undertow loses its force; the distance of these lines from the land being determined by the force of the storms that carried the waters shoreward. This is only a suggested explanation, however, as the complete history of these structures has not been determined.

EMBANKMENTS.

The combined action of waves and currents along shores of moderate slope results, as we have seen, in the formation of cut terraces, sea-cliffs, built terraces, and barrier bars. When the shore becomes steep or any abrupt change in its direction takes place, as when the mouth of a bay is reached or a promontory projects from the shore, the current does not follow the sinuosities of the land but continues its course, and, on entering deeper water, loses its power of transportation and deposits its load. Fresh material is carried along in a more or less continuous stream by the shore current and added to that previously deposited, thus forming a subaqueous embankment. This process is continued until the deposit is raised to the level of the barrier bar or terrace, as the case may be, along which the current-borne *débris* is carried. This process continuing, the embankment increases in length but not in height; its crest, like that of a barrier bar, has its height determined by the horizon of the lake surface. It is evident from their mode of formation that embankments are but prolongations of built terraces and barrier bars; in fact one form merges into the other in such a manner that it is not always possible to determine in which list a given structure should be placed.

The formation of embankments will, perhaps, be rendered more intelligible by referring to the accompanying topographic sketch, in which a por-

tion of a gently sloping lake margin adjacent to a bay is represented. The current in sweeping along the shelving shore in the direction indicated by

FIG. 11.—Ideal plate illustrating the formation of embankments.

the arrow, will carry with it a narrow band of shore drift; when the entrance to the bay is reached the direction of the current is but little changed; it consequently enters deeper waters where its velocity is checked and its load of *débris* deposited. Fresh material continues to be swept along the shore terrace and is added to that already accumulated until a long, narrow, level-topped embankment is built up. Current-formed structures of this nature have the character of a railroad embankment, and sometimes grow to be miles in length and perhaps several hundred feet high. Should the conditions represented in the sketch continue long enough, it is evident that the bay will eventually be cut off from the lake and form a lagoon; in such an instance it is frequently convenient to speak of the structure as a bay-embankment. In case the bay chances to be at the mouth of a stream, the embankment may become breached by the outflowing waters and repaired again by the currents, thus complicating the stratification of the deposit.

Embankments, like barrier bars, when exposed in cross section present a more or less perfect anticlinal structure due to the mode of their deposition. When buried beneath subsequent deposits, as lacustral beds, for example, and dissected by erosion, they sometimes simulate a true anticlinal formed by the folding of the strata; an instance of this nature is illustrated on Plate XXV.

Simple embankments, like that shown in the above illustration, are usually either straight or but slightly curved, and end at the distal extremity in a semicircular scarp the slope of which depends on the angle of stability in water of the material of which the structure is composed. Beyond the end of the embankment sand-banks are commonly formed by the subsidence of

the finer particles carried along by the current and held in suspension for some time after the coarser material has been deposited; as the structure is prolonged this fine *débris* becomes buried beneath the gravel and stones composing the major part of the embankment, and many times becomes folded and crumpled owing to the weight of the superimposed mass.

The action of waves and currents in forming embankments is subject to a multitude of variations dependent on the topography of the shores, on the character of the material moved, on changes in the direction of winds and currents, and on many other conditions. As may be imagined, the resultant forms are equally diverse. Should a lake be also subject to great fluctuations of level, the structure and grouping of the embankments will be still more complicated. When a lake rises, new embankments and built-terraces are formed above older ones; when it falls, previously formed structures are cut away and remodeled into new forms. In the first instance, a line of division or an unconformability will mark the junction of the older and the newer deposits; such an example is shown in cross section at *a* in the following figure, which represents contiguous built-terraces of different date: the altered conditions may also be recorded by changes in the character of the material of which the embankments are formed. In the second instance,

FIG. 12.—Diagrams illustrating the relative age of gravel terraces and embankments.

i. e., when the lower structure is formed subsequently to the upper, the unconformity is of a different nature as is illustrated by section *b*; in an instance of this nature the scarp of the older structure is quite commonly somewhat modified by erosion. When current-built embankments of different dates are not contiguous, as represented at *c*, their relative age cannot be determined in the same manner as in the previous examples.

Sometimes a current in sweeping past a promontory will build embankments tangent to it, which become curved or sickle-shaped at their free extremities, as is illustrated on Plate XIX; again, such embankments may curve abruptly at the end so as to resemble the letter **J**, and are conven-

iently designated as J-bars. Other modifications of gravel-built structures will be noticed in the descriptions of the shores of Lake Lahontan which follow.

Water at rest having no power to erode, it is evident that lakes modify their shores but little during calm weather; it is when storms are raging that the potency of waves and currents reaches a maximum, and the greater part of terrace cutting and bar building takes place. The level of the highest water line as recorded by works of construction, is the storm level; in some instances this is several feet above the normal lake surface, for the reason that the water is raised to an abnormal height along a shore against which a gale is blowing. The topography of a coast may cause the storm waves to reach a higher level in some portions than in others, as, for example, where a funnel-shaped bay opens out into a broad lake. In such an instance the water will be driven into the bay during on-shore storms and forced to a greater height than on a more open coast. For these reasons the highest beach-lines of a lake at various points are not always in the same plane; a fact that should be borne in mind while measuring the depth of fossil lakes and in studying the effects of orographic movement.

DELTA.

The general forms of the fan-shaped accumulations of gravel, sand, and silt deposited about the mouths of streams which enter still water, are too well known to require a detailed description.

When a stream bringing silt and sand in suspension and rolling pebbles and larger rock masses along its bed debouches into still water, its momentum is checked and the greater part of its load is deposited. When the structure thus begun is undisturbed by currents it is built out equally in all directions from the mouth of the stream and thus acquires a semi-circular or fan-shaped topographic form. When a high-grade stream enters a valley it commonly deposits a heap of *débris* about the point of discharge, which has received the name of an alluvial cone; a delta may be considered as an alluvial cone that has been formed with its base below water. The part of a delta that is above the reach of the waves has the irregular structure characteristic of alluvial deposits, but the submerged portion

acquires a more or less well-defined oblique stratification, which may be called a "delta structure." During the building of a delta the stream meanders over all parts of its surface that are not submerged, and, in irregular succession, discharges at all points of its periphery; in this manner the stream-borne *débris* is carried to all points on the edge of the deposit and allowed to roll down the submerged slope. The strata thus formed are inclined, the amount of their inclination depending upon the angle of stability in water of the material deposited. Observation has shown that the slope of a delta scarp commonly is from 20 to 25 degrees. The fine sand and mud held in suspension is carried farther than the stones and gravel, and is deposited about the base of the delta scarp, decreasing in quantity and becoming finer the farther it is carried from the point of discharge. The stream-borne silt thus tends to build up a secondary cone outside the base of the main delta, which, on its outer margin, merges with the lacustral sediments deposited in the central portion of the lake. In the growth of a delta the scarp of coarse *débris* is gradually advanced on all sides and consequently overplaces the secondary cone at its base; this added weight frequently causes the fine sediment to be crumpled into folds and perhaps broken by small faults.

A delta deposited at the mouth of a high-grade stream will have three well marked divisions, as shown in the following diagram:

FIG. 13.—Ideal section of a high-grade delta.

At the top is an alluvial cone (*a*) of unassorted material, resting on (*b*) a deposit of obliquely stratified gravel, which in turn is built out over a secondary cone (*ca*) of sand and silt. As a delta grows, *a* becomes thickened, and is built out over *b*, which at the same time is carried forward over *c*. In this manner the characteristic tripartite structure of deltas originates. In low-grade streams, which all long rivers necessarily are, the material

transported to their mouths is fine silt, and in their deltas the divisions described above are obscure and indeterminate.

A fluctuation of lake level during the formation of deltas produces even greater modifications in their forms and structure than the same change of conditions would in the nature of current-formed embankments. When the waters of a lake rise and submerge a delta, a new one is at once commenced and carried forward in the same manner as the first, which it may eventually bury so completely that only a deep section would reveal its presence. In some ancient deltas that have been dissected by erosion a stratum of lacustral sediments is found separating two delta deposits. In such an instance the included sheet of fine material is thickest near the outer margin of the structure; the formation of the higher delta and the deposition of the fine sediments took place at the same time, the latter being finally overlapped by the former. The lowering of a lake causes its tributary streams to erode channels through their previously formed deltas and to commence the building of new ones, either in the gap thus formed, or altogether below the former structure. In some instances in the Bonneville and the Mono basins this action was carried forward at a number of successive stages until a series of small deltas were formed, each starting in the channel cut through its predecessor. In the formation of deltas, as in the construction of terraces and embankments, one of the most important conditions requisite for the production of typical examples on a large scale is permanence of lake level. The finest deltas are formed in lakes that maintain a constant horizon for a considerable time and receive the influx of high-grade streams which are abundantly loaded with *débris*.

In the above sketch attention has only been given to the modifications of lake shores and tideless seas; the action of the waves, currents and tides of the ocean receiving no consideration, because they are foreign to the scope of the present essay.

RECAPITULATION.

Cut terraces are shelves carved in the shores of lakes by the action of waves and currents; they are bounded on both their shoreward and lake-ward margins by steeper slopes; the former inclines upward and forms a

sea-cliff, the latter slopes downward and forms a terrace scarp. Their upper limit is a horizontal line marking the level of the water at the time they were formed; their surfaces slope gently lakeward.

Built terraces are shelves of *débris* formed along shores and are usually adjoined to or combined with cut terraces. As in the previous instance, they are limited on their lakeward borders by terrace-scarps, and may or may not occur at the bases of sea-cliffs. Their shoreward margins are horizontal.

Sea-cliffs are scarps formed by the erosion of cut terraces; their bases are horizontal and coincide with the upper limit of terraces.

Barrier bars are ridges usually composed of water-worn gravel, deposited by currents in shallow water at some distance from land. Their crests are horizontal, and mark the storm limit of the waves and currents that built them. In cross-section they exhibit anticlinals of deposition. Aberrant forms are V-bars, J-bars, looped bars, etc.

Embankments are deposits formed by the transportation of shore drift along terraces and barrier bars, of which they are continuations, to localities where the water deepens. Like built terraces and barrier bars, they are composed of water-worn *débris*, but are frequently of great size; their tops are horizontal, and in cross-section they exhibit anticlinals of deposition.

Deltas are accumulations of stream-borne *débris* deposited about the mouths of streams that debouch into still water; topographically they are semicircular or fan-shaped, and, when seen in radial section, exhibit a tripartite structure.

Since the present chapter was written, a graphic and comprehensive summary of lake shore phenomena has been published by Mr. Gilbert in the Fifth Annual Report of the United States Geological Survey, to which the reader is referred for a more complete discussion of the geological effects of waves and currents than is contained in the present sketch.

SECTION 2.—SHORE PHENOMENA OF LAKE LAHONTAN.

In considering the question of outlet in a previous chapter, it was shown that the shores of Lake Lahontan are unbroken by a channel of overflow. It was therefore an inclosed lake, and, like others of its class, must have

been subject to repeated fluctuations of level. That such was its history is also evident from the multitude of terraces still remaining as records of its former changes. The Lahontan water-lines are lacking in strength as compared, for example, with those of Lake Bonneville, the reason being in part, evidently, that the ancient lake margins were precipitous throughout a large portion of their extent, and the water-surface was greatly broken by islands and headlands which must have retarded the force of the waves and currents; but the main reason why the old shore lines are poorly defined is that the lake surface was not held at any definite horizon for a considerable time. The records of wave action still remaining are sufficiently distinct, however, to be easily traced, except on some gently-sloping shores where the waters were shallow, and at the heads of deep narrow bays where all shore phenomena are frequently absent. In the Lahontan basin, as in all fossil lakes, the elements of shore topography to which we turn for the history of the ancient water-body are terraces, sea-cliffs, bars, embankments, deltas, etc.

TERRACES AND SEA-CLIFFS.

The most common of the records inscribed on the borders of the Lahontan basin are cut terraces. These may be traced throughout a very large portion of the basin, but are most distinct on the borders of the larger deserts. About the southern margin of the Carson Desert the ancient lake was limited by mountains of soft, volcanic rock, which yielded easily to both wave action and subaërial erosion. The result is a group of Gothic-like mountains rising from a broad, horizontally scored base. The contrast between rain-sculpture and wave-sculpture is here well marked.

In traveling over the Central Pacific Railroad between Golconda and Wadsworth, one is seldom out of sight of the long horizontal lines drawn by the waves of the ancient lake on the shores that confined them. Records of the same character may be traced continuously about the borders of the Black Rock and Smoke Creek deserts, and are strongly defined along the bases of the mountains overlooking Pyramid and Winnemucca lakes. They are again plainly legible on the steep slopes bordering Walker Lake, as may be observed by the traveler over the Carson and Colorado Railroad.

The highest of these numerous shore lines we have named the "Lahontan Beach," as it records the highest water stage of the former lake. Its elevation above the sea, as shown by lines of level connecting with the Central Pacific Railroad surveys, is 4,343 feet at Mill City, and from 4,418 to 4,427 feet at the lower end of Humboldt Lake.⁴⁰ Barometric measurements of the altitude of Pyramid Lake, for which I am indebted to Messrs. J. S. Diller and M. B. Kerr,⁴¹ determine its 1882 level to have been 3,783 feet above the sea. The Lahontan beach in the vicinity of the lake, as measured by several lines of leveling, is 530 feet above its 1882 level, and therefore 4,313 feet above the sea. The altitude of the surface of the former lake, as determined by Clarence King, was 4,388 feet.⁴² These results, together with many measurements with the aneroid barometer and by angulation, show that the old shore lines are not now horizontal, owing to the orographic movement that has taken place since their formation, as will be described in Chapter X. What their original horizon may have been is not now susceptible of accurate determination. An average of the various measurements that have been made of the present elevation of the Lahontan beach gives 4,378 feet, which is the nearest approximation we can make to its original altitude.

Besides the Lahontan beach there are three other water-lines of sufficient importance in the history of the lake to deserve special designation. One of these is a strongly defined terrace, 30 feet below the Lahontan beach, and at the upper limit of a calcareous deposit, precipitated from the waters of the ancient lake, which we have named "Lithoid Tufa"; we therefore call this the "Lithoid Terrace." Its elevation is 500 feet above the 1882 level of Pyramid Lake.

Another chemical deposit, known as "Dendritic Tufa," occurs in great quantities in the same basin, and at its upper limit is bounded by a water-line, usually but poorly defined, which we name the "Dendritic Terrace." Its elevation is 320 feet above the datum plain just mentioned.

⁴⁰See profile in Plate XVIII.

⁴¹Its elevation was determined by barometric readings at Reno and at the lake surface in June, 1884, and gave a difference of level of 715.5 feet. The elevation of Reno, as determined by the Central Pacific Railroad surveys, is 4,497 feet.

⁴²U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 507.

Between the dendritic terrace and the surface of Pyramid Lake there is a broad platform, which is the strongest and best defined of all the Lahontan water-lines. It marks the upper limit of a third variety of tufa, known as "Thinolite"; we call it, therefore, the "Thinolite Terrace." Its elevation is about 110 feet above the level of Pyramid Lake in 1882. This terrace has been found to extend entirely around the valleys occupied by Pyramid and Winnemucca lakes, and may also be followed, though with less certainty, along the borders of Black Rock, Smoke Creek, and Carson deserts.

The terraces we have named, together with the present level of Pyramid Lake, furnish four definite horizons that will be found convenient reference plains in tracing the Quaternary history of the basin. It is only at exceptional localities, however, that these terraces can be followed for any considerable distance, and at only a few points could a sequence like the one shown below be obtained from actual measurements. Our diagram is a generalized profile of the Lahontan shores.

FIG. 14.—Generalized profile of Lahontan shores.

The relative age of the various water-lines shown in the diagram will be discussed in connection when the chemical history of the lake is considered.

The highest terrace of all, the Lahontan, is an inconspicuous feature in itself, but it is important as forming the boundary between subaërial and subaqueous sculpture on the sides of the valleys. It usually appears as a

terrace of construction a few feet wide, resting on the broad lithoid terrace 30 feet below. Where the shore records are unusually well displayed, as along the western margin of Pyramid Lake and on the south side of the Carson Desert, the lithoid terrace sometimes has a width of 200 or 300 feet. Resting on it we sometimes find two built terraces of gravel and rolled stones, the water-line of one being the highest of all the shore records; the second is intermediate between the Lahontan beach and the lithoid terrace. This arrangement is illustrated in the accompanying diagram, which exhibits a generalized profile of the shore:

FIG. 15.—Profile of Lithoid Terrace and Lahontan beach.

The line *ab* represents the original slope of the mountain side before it was modified by the waves of the lake. The lithoid terrace *cd* was first formed, the outer edge being built of detritus. The magnitude and persistence of this terrace indicate that the water stood for a long time at a nearly constant level, allowing the waves to carve out a broad shelf from the solid rock. As we shall see further on, the terrace became coated with calcareous tufa, and its gravel was cemented into a conglomerate. At some later period in the history of the lake the water rose and built the two small embankments, or terraces, that rest upon it, but it remained at these horizons only a comparatively short time.

Besides the more definite and strongly marked terraces to which we have given names, there are a large number of less deeply engraved lines on nearly every portion of the former shore. Each of these scorings, as we well know, is the record of a pause in the fluctuations of the water surface; collectively they indicate numerous changes in the lake level. The obscurity and want of strength in many of the terraces is no doubt due in a great measure to the fact that the slopes on which they are traced have

been brought within the reach of wave action many times. In this way the records first made have been erased or obscured by subsequent additions.

One of the best localities in the basin for the observation of ancient lake-margins is at Terrace Point, near the northern end of Pyramid Lake.⁴³ The water-lines at this locality are drawn at nearly equal intervals, and are approximately of the same strength. Even at a distance of several miles they continue to form a conspicuous and striking feature in the scenery of the region. These terraces are the result of both the destructive and constructive action of waves and currents, and are largely composed of basaltic *débris* mingled with worn and rounded fragments of the different varieties of tufa that sheath the interior of the basin. The presence of tufa in the terraces renders it evident that they were formed subsequent to the deposition of the main tufa deposits, and, therefore, at least in part, belong to a very recent chapter in the history of Lake Lahontan. These facts will receive further consideration in the discussion of the chemistry of the tufas.

The topography of terraced shores is well illustrated on Anaho Island, Pyramid Lake, a map of which forms Plate X. The broad bench formed by the lithoid terrace extends completely about the island and forms the base for the tufa-coated crags that are apparently piled in huge pyramids upon it. At an elevation of 320 feet above the lake surface the poorly defined dendritic terrace may be seen, and nearly at the top of the island is a faint line marking the position of the Lahontan beach. At the time when the ancient lake reached its greatest extension, Anaho Island stood but 15 or 20 feet above its surface, and during severe storms must have been completely buried by the dash of the waves. The modifications of topography produced by terraces may also be seen on the Marble Buttes at the southern end of Pyramid Lake, which at one time formed a group of small islands in Lake Lahontan; and, again, about the shores of Humboldt Lake, a portion of which are shown in Plate XVIII.

Although the terraces in the Lahontan basin are sufficiently distinct to enable one to trace the outline of the ancient lake with accuracy, yet they are by no means so well defined as the similar records made by the waters of Lake Bonneville. In the former instance we have the result of the action

⁴³ See Plate IX.

of the waves and currents in an inclosed lake, the surface of which must have fluctuated with the seasons, and become of broad extent during long periods of more than usual humidity, only to contract again and perhaps be divided into separate water bodies with the return of arid conditions. Hence the comparative indefiniteness of its water lines. In the case of the ancient Utah lake the horizons of the most strongly defined terraces were determined by overflow; the water surface was thus maintained at a constant level for long periods, and the shore phenomena at these favored stages became the grandest that have yet been studied.

BARS AND EMBANKMENTS.

The deposits in the Lahontan basin that owe their origin wholly to the constructive action of waves and currents are far more important and instructive than the associated terraces, and are deserving of the most careful attention. Accumulations of gravel in the form of bars and embankments occur at many points along the ancient shores which we are studying, but in many cases these structures are indefinite or complicated, and their bearing on the history of the former lake is difficult to trace. We have therefore selected a few of the more typical examples to serve as illustrations of the various phenomena observed. The maps accompanying the following descriptions were drawn by Mr. Johnson from plane-table surveys made by himself, and are so truthful and graphic that they require but little interpretation.

EMBANKMENTS AT THE WEST END OF HUMBOLDT LAKE.

Humboldt Lake owes its existence to the damming of the Humboldt River by extensive gravel embankments which were thrown completely across its channel during the time that Lake Lahontan occupied the valley. The topography about the west end of the lake is represented with accuracy on the accompanying map, Plate XVIII, which embraces the entire breadth of the former lake in this portion of the valley. The highest level of the ancient water surface is represented on the map by a heavy broken line, and appears in the topography of the country as a gravel embankment, or a wave-cut terrace at the base of a sea-cliff that is sometimes a hundred feet

or more in height. On the western side of the valley this ancient water line is rendered especially noticeable by the cliffs of deep purple that mark its course.

The narrow valley in which Humboldt Lake is situated was a strait at the time of the higher stages of Lake Lahontan, and connected the Carson body of the former lake with the waters that occupied the northern part of the Humboldt Valley. In its topographical relations it was similar to the constriction in the valley at the southern end of Winnemucca Lake, and is paralleled in the Bonneville basin by the narrow passage, now known as the Narrows of the Jordan, which connected the main body of Lake Bonneville with the Utah Lake body. In all these localities, and in many others similarly situated that have been studied by the writer in the basins of the extinct lakes of Utah and Nevada, the beach phenomena are greatly intensified, and bars and embankments of gravel are unusually well displayed.

At the southern end of Humboldt Lake a single embankment of gravel from 50 to 125 feet in height⁴⁴ has been carried completely across the valley in such a manner as to suggest that it is an artificial structure intended to confine the drainage. At either end the main embankment widens as it approaches the shore and forms heavy triangular masses of gravel, on the surface of which appear many smaller bars built of clean, well-worn shingle. These secondary bars form ridges with rounded crests which vary from a few feet up to thirty or forty feet in height, and are nearly level-topped for long distances. These are seldom straight, but curve with beautiful symmetry, each gracefully bending ridge marking the course of a current in the waters of the ancient lake in which it was formed.

The main embankment, *i. e.*, the one crossing the valley, declines gently in height from either end towards the center, and has been cut through at its lowest point by the overflow of Humboldt Lake. The gap carved by the outflowing waters is shown in the profile at the bottom of Plate XVIII. The diagram was constructed from a line of levels run from the Lahontan beach on the Niter Buttes to the highest water line on the west side of the valley; the points selected for the beginning and the end of the line were free

⁴⁴The base of this structure is deeply buried beneath lacustral sediments; the figures given above indicate its elevation above Humboldt Lake.

Vertical Scale of Profile four times the horizontal.

bars with rounded crests, thus securing the highest records of wave action in this portion of the former lake. One result of these measurements is the proof that the beach lines on the sides of the valley, although formed at the highest water stage of the former lake, and therefore originally in the same horizontal plane, no longer have the same elevation. On the east side, the highest water line is now 498 feet above the level of Humboldt Lake, while on the west its elevation is 489 feet. Humboldt Lake, as shown by connecting our line of levels with the profile of the Central Pacific Railroad, is 3,929 feet above the sea.

In studying these wave-built structures more minutely, we find that the one which crosses the valley is composed of worn and rounded pebbles of basalt, rhyolite, granite, and quartzite, together with fragments of black slate and occasional masses of cemented pebbles. The granite and quartzite and the volcanic rock forming some of the pebbles are only found in place in the vicinity on the north side of Humboldt Lake; consequently, the currents which carried them to their present positions must have come from the northeast and followed the western border of the valley until deflected by the topography of the coast. The direction of the currents that built this embankment is also indicated by its form; to the westward it presents a steep escarpment, but the eastern slope is quite gentle and, especially near its extremities, merges gradually with the alluvial slopes in the sides of the valley. The more gentle slope indicates the general direction from which the current-borne *débris* was derived. In the following section a profile of the bar is given, constructed with the same vertical and horizontal scale, from a line of levels run at right angles to the trend of the structure at a point about two miles west of the gap cut by the overflow of Humboldt Lake.

FIG. 16.—Profile of gravel embankment at west end of Humboldt Lake.

The topography of the embankment, therefore, as well as the material of which it is composed, indicates that it was built very largely by currents from the north. It is highest at the northern end, near where the railroad

crosses it, but maintains a nearly horizontal crest for at least a third of the way to the point where the river has cut through; it then falls off with an abrupt descent to a level six or eight feet lower, the crest of the structure at the same time becoming broadened and curved slightly westward. Continuing southward, one descends three more similar scarps of less height before reaching the lowest point in the embankment. Each of these descents is formed by the end of a comparatively thin layer of gravel that was added by the currents to the surface of the structure, and would no doubt have been carried along its whole extent had not a rise in the lake caused the currents to begin the formation of another similar sheet of gravel near the shore and at a higher level. Each of the steps in the crest of the embankment represents a pause in the rise of the waters of the ancient lake. The highest in the series was the last formed. The incompleteness in this instance furnishes the suggestion that similar embankments which seem from their form to be homogeneous may in reality be highly compound. The irregular stratification of the embankment retaining Humboldt Lake is illustrated by the following sketch of the section exposed on the right side of the channel that has been eroded through it. The general inclination of the strata on the west side of the embankment is much greater than on

FIG. 17.—Section of gravel embankment at west end of Humboldt Lake.

the east, the reason being that in deposits of this nature the scarps sloping with the current are usually steeper than those inclined in the direction from which the current arrives. The lines of unconformability sloping gently westward in the upper part of the section indicate periods of erosion when the top of the structure was removed and subsequently rebuilt with current-bedded gravels. At the time these alterations were made, the lake surface in each instance must have been nearly on a level with the top of the embankment.

The embankment crossing the valley is older than the branching structures forming the surface at either end, as is shown by the superposition of the latter. This is well exhibited in the left side of the gap cut by

the Humboldt, where the homogeneous black gravel composing the end bars rests directly on the more heterogeneous material forming the main embankment. Its greater age is also shown by its being incrustated on its western slope by the three main varieties of Lahontan tufa hereafter to be described, while the end bars are almost entirely free from these deposits.

In a terrace of black gravel on the northern slope of the Niter Buttes, dendritic tufa between heavy beds of gravel indicates that there were periods of bar building both before and after the formation of the tufa. On the north side of the valley, northeast of the north end of the main embankment, an arroyo has cut the gravel deposits so as to reveal an interbedded stratum of white marl; this again marks a division between two periods during which embankments were formed. These interruptions in the gravel deposits are noted now as a part of the facts observed in the region we are describing, but their connection with the history of the lake will be described in a future chapter.

The embankments on the south side of the valley, as shown on Plate XVIII, appear, topographically, to be branches of the main structure, but in reality they were formed at a later date by currents sweeping westward along the southern border of the valley. This is shown not only by their being tangent to the projection formed by the Niter Buttes, but is also evident from the nature of the material of which they are composed. The Niter Buttes and Mopung Hills are rhyolite, while the mountains skirting the southern shore of Humboldt Lake are largely composed of black slate. The gravel forming the symmetric embankments at the base of the Niter Buttes is composed almost wholly of water-worn pebbles of black slate, and could only have been derived from cliffs of the same material to the eastward; the gravel of which the bars are composed may, in fact, be traced continuously to the quarries from which it was obtained.

On the steep western slope of the Niter Buttes are a number of terraces, each of which records a pause in the fluctuation of the lake in which they were formed. The most conspicuous of these is a broad shelf of black gravel which girdles the promontory at an elevation of 220 feet above Humboldt Lake. The gravel forming this shelf consists of well-rounded fragments of black slate identical with those composing the bars at a lower

level, and derived from the same source. As the rock composing the buttes has a bright reddish tint, the position of this terrace is rendered conspicuous by contrast in color. At the southern side of the buttes this terrace leaves the steep slope and crosses an alluvial cone, changing at the same time from a terrace to a barrier bar with a rounded crest. In cross-section, like nearly all gravel bars, it exhibits an oblique stratification which is most pronounced on the lakeward slope.

FIG. 18.—Section of bar on the Niter Buttes.

The angular alluvium on which the bar rests is largely composed of brightly-colored rhyolite, derived from the cliffs above, while the bar, like the terrace of which it is a continuation, is almost wholly formed of pebbles of black slate, which indicate by their rounded forms and polished surfaces that they have traveled a long way since leaving their parent ledges in the cliffs on the southern border of Humboldt Lake. On following these gravels still farther southward, we find that they again form a terrace, which soon loses its identity, however, on approaching the Mopung Hills.

The group of bars on the north side of the valley, like the corresponding structures at the base of the Niter Buttes, are level-topped ridges of clean, well-worn gravel, forming graceful curves; but the gravel in this instance was very largely contributed by currents from the west. The spaces inclosed by these ridges are in almost all cases floored with light-colored mud, forming playas, which are converted into shallow lakelets by every storm. The relative age of these bars may be determined in some instances by the superposition of one upon another, and by the fact that some are partially covered with tufa, while others, of later date, are free from that deposit.

The complexity of these embankments, arising from the fact that they were formed at many horizons and at various stages in the former lake, together with the erosion and rebuilding that has taken place, renders their

structure complex and their bearing on Lahontan history, *i. e.*, their value as records of Quaternary climate, exceedingly difficult to trace. From the occurrence of Lithoid tufa⁴⁵—the oldest variety found in the basin—on the western slope of the main bar, it is evident that the deposit of gravel at this locality was commenced early in the existence of the old lake, perhaps at the very first rise of its waters; and, as we have seen, enlargement and reconstruction have taken place at many subsequent periods and at many stages in the vertical range of the lake's surface.

The trifling changes that have occurred in the area embraced by the accompanying maps, since the withdrawal of the waters of Lake Lahontan, are indicated by the arroyos or small water-courses cutting the embankments, and by the gap eroded by the overflowing waters of Humboldt Lake; with these exceptions, the structures are as fresh in appearance and as perfect in form as if they had been exposed to subaërial degradation for only a few years.

The contrast in the topography above and below the Lahontan beach, in the region about Humboldt Lake, is so pronounced that it at once attracts the attention of the observer. The mountains above the level of the former lake have the rugged and angular aspect characteristic of the subaërial erosion of arid climates, while below that horizon the topography is remarkable for its sweeping curves and flowing outlines. In the former instance the direction of the lines of erosion is controlled by the flow of rills and rivulets, and approaches the perpendicular; in the latter the predominating lines in the landscape are modeled by the waves and currents of a level water surface, and are therefore horizontal. The characteristics of the topography in one instance are due to subaerial, and in the other to subaqueous, conditions.

Orographic movement has taken place on a grand scale in the region represented on Plate XVIII. This is illustrated by the great fault, with a throw of several thousand feet, which determines the northwestern face of the west Humboldt Range. This fault passes between the Niter Buttes and the main range to the southward, and a curving branch determines the western face of the promontory formed by these buttes. The nearly perpendicular

⁴⁵ Thinolite and dendritic tufa also occur in abundance at this locality.

northern face of the Mopung Hills was also formed by the same displacement. The greater part of the orographic disturbance in this region took place previous to the rise of Lake Lahontan, and gave origin to the main features in the structure of the basin now occupied by Humboldt Lake. Movements must have taken place along this line of fracture during the inter-Lahontan time, as is indicated by sloping terraces on the western face of the Niter Buttes. Since the withdrawal of the waters of the former lake the fault at the immediate base of the west Humboldt Range has increased its displacement 50 or 60 feet, and formed fresh scarps in Lahontan gravels (see Plate XLV). There has also been some recent movement in the branching faults about the base of the Niter Buttes, which may be traced for a considerable distance across the alluvial slopes to the westward, and appears again at the base of the Mopung Hills. The displacements, noticed above in explanation of the accompanying map, will receive further attention in Chapter X, which is devoted to post-Quaternary orography.

EMBANKMENTS ON THE SOUTHERN BORDER OF THE CARSON DESERT.

On the south shore of South Carson Lake there stands a bold, rugged promontory of basaltic rock that is girdled with terraces and incrustated with tufa about its base. During the existence of Lake Lahontan, this butte formed a high, rocky island, that was separated from the mainland to the southward by a narrow strait, partially obstructed by small islands, through which the currents must have swept with great force. On the southern or mainland border of the strait, the group of gravel bars represented on Plate XIX were formed.

The changes wrought by waves and currents are marked with unusual distinctness all along the southern margin of the Carson Desert. This was the shore of the largest open water area of the former lake, and was exposed to the full force of storms from the north. The conspicuous sea-cliff on the southern margin of the Carson Desert may be followed all the way to the pass near Allen's Springs, where it is bold and rugged, as represented by the heavy hachuring at the top of the accompanying plate. During the higher stages of the lake the currents swept southward through the pass, carrying with them the *débris* of the sea-

GRAVEL EMBANKMENTS ON SOUTH BORDER OF THE CARSON DESERT, NEVADA.

cliffs, and depositing it in less exposed situations under the lee of the promontory where the shore receded and formed a bay. The sickle-shaped bars with free extremities, which resulted from this action, indicate by their forms, as well as by the character of the pebbles and stones composing them, the direction followed by the currents to which they owe their origin. The hill represented at the top of the accompanying map is of white rhyolite, with a high, narrow spur of black anamesite projecting from its southern border. The latter rock also composes the hills represented in the southwestern portion of the map. Between these rugged outcrops there is a gentle slope of alluvium, cut by miniature drainage lines. The striking contrast in the color of the rock in place at either end of the embankments enables one to determine at a glance the localities from which the stones composing them were derived.

The broad, lightly shaded bands on the right of the map, having a southeast bearing, are low gravel bars that form the crest of the divide in the pass, or ancient strait, and are now separated by a smooth playa. The drainage north of these bars is into South Carson Lake, while the rill-lines south of them combine to form a water-course that leads eastward past Allen's Springs into the desert valley which opens southward. The curved bars, shown in the central portion of the map, are thus confined in vertical range between the highest water-line of the former lake, *i. e.*, the Lahontan beach, and the highest part of the pass in which they occur. This interval measures 114 feet, or, in other words, the water was 114 feet deep in the shallowest part of the strait at the time the highest embankment was formed.

The highest of this series of gravel structures are shown at A and B on the map. A is a short, curved bar, 3 or 4 feet higher than the long, sickle-shaped embankment on which it rests, and is composed of well-worn stones and gravel of anamesite and rhyolite. That this bar was built subsequent to the much longer embankment beneath is proven by the stratification to be observed at its terminus. Its outer or lakeward slope is regular, with a curved contour that is the result of deposition. Had the lower embankment been built last, the outer slope of the higher structure would have been cut away by shore erosion, so as to form a sea-cliff. The embankment at B is at the same horizon as the smaller

one at A. It leaves the shore and returns to it, thus forming a loop inclosing a cup-shaped depression 5 or 6 feet deep, now smoothly floored with playa mud. The long, curved bar C has a smooth, evenly rounded top and a nearly horizontal crest-line, which decreases slightly in height, however, as we approach its southern end, where the curvature is more abrupt. Like all the embankments in the series, this is composed largely of rhyolite, with some anamesite, all rounded and well worn, but coarsest near its northern end. At its southern end it becomes broader, as well as more sharply curved, and shows three or four minor divisions, thus indicating that it is a compound structure throughout. The area to the westward of this embankment, once a lagoon, is now a playa, floored with smooth, horizontal, light-colored mud, that is unclothed with vegetation of any kind. That the embankment C is of a later date than the platform on which it rests is shown by the same kind of evidence that proves it to be of older date than the bars superimposed upon it. This is an interesting conclusion, as the bar below C is incrustated and cemented with lithoid tufa, thus showing that the higher bars were constructed after the formation of the calcareous deposit. The bar C is a portion of the water-line designated as the lithoid terrace on page 101. The highest exposure of tufa is here about 25 feet below the Lahontan beach. A corresponding relation of the lithoid terrace to the highest beach line has been observed at a number of other localities in the Lahontan basin, and will again claim attention when the oscillations of the lake are considered. The outer margin of the platform on which the bar C rests has been cut away by waves and currents so as to expose a steep sea-cliff of cemented gravel, and furnishes the only example in the group of a gravel structure that has suffered erosion by the waters of the lake in which it was formed. Below this horizon are other curved and sickle-shaped embankments, the relative age of which is indicated by the manner in which they overplace each other. The topography of these structures, and the playas they contain, are faithfully represented on the accompanying map.

The bars described above, with the exception mentioned, are unaffected by erosion, and are as smooth and regular as if their elegantly curved ridges were formed but yesterday. They afford beautiful examples of the symmetry of water-built structures.

The sea-cliff marking the horizon of the highest water-line is a conspicuous feature on the more exposed shores in the area embraced by the accompanying map, but cannot be distinguished on the alluvial slopes of the bays, where the water was shallow and sheltered from waves and currents. The material cut away to form the sea-cliffs shown in the lower part of Plate XIX was carried southward and built into a series of looped and V-shaped bars, inclosing deep cups, at another angle of the shore, a few hundred yards away.

EMBANKMENTS AT BUFFALO SPRINGS, NEVADA.

Passing north from Carson Desert, one crosses a low, narrow divide, once a strait in Lake Lahontan, and enters a valley having a broad playa in its central portion and surrounded on all sides by alluvial slopes, above which rise angular mountain crests. Around the borders of the valley, at an elevation of about 300 feet above the playa, the Lahontan beach can be traced with distinctness. The lowest point on the pass at the north end of the valley is higher than the Lahontan beach, and was never crossed by the waters of the old lake. The valley was therefore a typical *cul-de-sac* at the time it was flooded by Lake Lahontan. Owing to the abundance of loose material furnished by the alluvial slopes, the shore phenomena in the valley consist almost entirely of works of construction. The most common of the structures due to shore action are rounded beaches of gravel, looped bars, and peculiar embankments, not designated by a special name, that extend out nearly at right angles to the general trend of the ancient shore and form conspicuous features in the topography of the basin. A locality near Buffalo Springs, at which these various features are well displayed, is represented on Plate XX. On the map the crests of the bars are light and the slope of their sides represented by hachures. The figures at various points represent vertical distances in feet below the Lahontan beach, which is taken as zero. They may be considered as soundings made in the ancient lake during its highest stage. Each of the bars has the form of a railroad embankment, with a somewhat rounded crest; they are even more clearly defined when examined in the field than they appear on the map, as

the nature of their material and the general absence of vegetation from their surfaces serve to accent the topographic forms.

Buffalo Springs are situated on the western border of the valley, at an elevation approximately 25 feet above the playa and 300 feet below the Lahontan beach. On Plate XX a portion of the border of the valley is represented which extends from Buffalo Springs to an elevation a short distance above the highest water line of the former lake. If the map had been continued a mile or two westward, it would have shown a greater portion of the sloping pediment of alluvium that surrounds the valley; and if extended for an equal distance east, it would have embraced a portion of a much gentler slope which finally merges with the playa in the bottom of the basin. The alluvial slope represented on the map above the highest beach shows a few of the numerous drainage lines which during the infrequent rains conduct the surface waters to the bottom of the valley. The influence of the beaches in deflecting the water-courses is indicated, as is also the manner in which streams shift their channels, and sometimes bifurcate, on alluvial slopes.

The first feature to attract attention on inspecting this group of embankments is the fact that they were built from the bottom up. The oldest in the series, so far as now exposed, is the lowest. The last formed is the Lahontan beach. Another division in reference to age is also possible, as a portion of the bars is coated with tufa, while other portions are free from that deposit. On referring to the plate it will be seen that the lowest well-defined beach occurs at a horizon 114 feet below the highest water line. This is a gravel ridge, forming an irregular V-bar, from the apex of which a somewhat curved embankment of gravel extends into the valley for about half a mile. The projecting bar is coated with lithoid and dendritic tufa, but the structures at a higher level are free from such deposits. The projecting bar has also suffered from erosion much more than those at a higher level, and, besides, is coated with fine sediments. It thus appears that the structures below the level of the lowest well-defined beach were formed before the deposition of the lithoid and dendritic tufas, while the bars and beaches above that horizon were built at a subsequent date. From data afforded at other localities we conclude that the construction of the higher

W. D. Johnson, Topographer.

I. C. Russell, Geologist.

GRAVEL EMBANKMENTS AT BUFFALO SPRINGS, NEVADA.

beaches took place during the last high-water stage of the lake. This determination, however, will appear more clear to the reader as we advance with our studies.

An inspection of the map shows that all the structures there represented were built in a rising lake, and were but little, if at all, modified by the waves and currents as the waters receded. This statement requires qualification however. We may be certain from the perfection of the ridges that the retiring waters did not tend to destroy them, but, on the other hand, they may have received additions. It is probable that gravel structures like those under discussion, when formed in a rising lake, would induce deposition at the same horizons during a recession of the waters. The sections of the structures at Buffalo Springs fail to give information on this point.

The only modifications that have taken place in these deposits in post-Lahontan times are due to the erosion of the rills that cross them and the partial removal of the fine sediment deposited over the older bars.

At the extreme distal end of the embankment that projects into the valley there are considerable accumulations of sand, illustrating the fact that fine material is carried farthest by currents when structures of this character are found, and showing why the bottoms of gravel embankments are frequently composed of sand. On either slope of the embankment the gravel of which it is composed is concealed beneath fine sediments, which must have been deposited when the lake stood over the structure. The looped bars high in the series at one time contained lagoons in which mollusks found a congenial habitat, as is shown by the multitudes of shells, principally of *Pompholyx*, that crowd the marls in the miniature playas behind a number of the embankments.

Three miles south of Buffalo Springs there is another group of embankments similar to that described above. These are represented on the sketch-map forming Plate XXI.⁴⁶

⁴⁶ This map is less accurate than the one forming Plate XX, but it indicates the main features of the structures as well as could be desired. The figures on Plate XXI are from aneroid measurements, and indicate approximately the depth of water at the highest water stage of Lake Lahontan. The figures on Plate XX are from measurements with an engineer's level, and may be considered accurate.

All the structures in this group were formed mainly by currents from the south, which swept along the lake shore, carrying shore drift with them, and were deflected from the land upon arriving at the place where deposition had been initiated. This is shown not only by the curvature of the terraces as they approach the bars, but also by the fact that the structures are much the steeper on the north side.

In these beaches and embankments, as in those at Buffalo Springs, two clearly defined divisions may be seen, which are of different age. The long bar projecting into the valley and marked with the numbers 95 to 100—indicating depth of water in feet at the highest stage of the former lake—is of older date than the group of V-shaped structures at a higher level.

The main embankment has a broad, smooth top, which is covered in places with lithoid and dendritic tufa, and is partially coated, especially on the sides, with fine lacustral sediments. Below the point marked with the figures 190, there is a steep scarp nearly a hundred feet high, from the base of which the bar continues on in the same direction as at the higher levels, but is more deeply covered with sediments, and finally becomes so completely inclosed that its presence is only indicated by the rise of the lacustral beds as they arch over the buried structure. The main embankment is thus older than the stages of the lake during which lithoid and dendritic tufa was precipitated, and was formed previous to a high-water period, during which the lacustral beds covering the structure were deposited.

Considering next the group of V-shaped bars at the north of the main structure, we find that the base of this compound group, so far as is revealed by the topography, is older than the highest portion of the main embankment, which was built upon it. The structures that occur from the Lahontan beach down to a horizon 75 feet below that level are of later date than the bar which is prolonged into the valley, as is shown by their freedom from both lacustral sediments and tufa deposits.

The difference in age of the two main divisions of this group thus furnishes evidence similar to that presented at the Buffalo Springs locality. The higher structures in each case are the younger. These two groups are the complement of each other, however, in the fact that the one at Buffalo Springs was built principally by currents from the north, while the second

W. D. Johnson, Topographer.

I. C. Russell, Geologist.

GRAVEL EMBANKMENTS THREE MILES SOUTH OF BUFFALO SPRINGS, NEVADA.

group, three miles south along the same shore, was constructed almost entirely by currents from the south.

The manner in which a gravel structure once started on the margin of a lake continues to induce deposition in case the waters rise, is well illustrated by the group of bars at the right on Plate XXI, which is literally a pile of **v**-bars, the lowest in the series being the oldest. The thickness of gravel in this compound structure exceeds a hundred feet, and, as shown by the topography, the material composing it was nearly all brought from the south.

Besides the embankments that have been specially examined, there are many others in the Lahontan basin of equal magnitude and perhaps equally instructive, which illustrate the variety of topographic forms produced by the action of waves and currents.

On the east shore of Walker Lake are two localities where gravel embankments of large size have been built out from the old lake shore and form capes the ends of which are washed by the waves of the present lake. These may be distinguished on Plate XV by the manner in which the railroad curves about them, close to the water's edge. At each of the localities there are a number of **v**-shaped gravel deposits that have been built one above another from a common base, so as to produce an exceedingly complicated structure.

In Alkali Valley, about three miles west of Sand Spring Pass, is another locality where the gravel accumulated along the shores of the former lake may be studied to advantage.

Other deposits of the same character may be seen on the east side of Humboldt Valley, between Rye Patch and Humboldt House, and again at the south end of Winnemucca Lake. A plat of the gravel structure at the last named locality is given below, which will serve as an illustration of the manner in which an embankment of large size may be thrown across a narrow strait so as to obstruct the drainage when the waters retire.

The deposits at this locality are very similar to the embankment at the west end of Humboldt Lake, represented on Plate XVIII, and find a parallel in the Bonneville basin in the immense bar at Stockton, Utah. In the

instance before us, the gravel forming the embankment was brought by shore currents from the north, along the east side of Winnemucca Valley, and deposited, when the current was deflected from the shore, so as to build the structure still remaining. This is a remarkably uniform embankment,

FIG. 19.—Gravel embankment at south end of Winnemucca Lake, Nevada.

about 250 feet high, which has all the features of an artificial structure intended to dam the valley of Winnemucca Lake. Its western end does not reach quite to the west shore of the strait, and since recession of the waters in which it was formed it has been truncated by the erosion of the branch of the Truckee River which flows into Winnemucca Lake. A portion of the section exposed by the removal of the end of the embankment is accurately shown in the following diagram.

FIG. 20.—Section of gravel embankment at south end of Winnemucca Lake, Nevada.

On the west side of the gap through which the Carson River leaves Churchill Valley there is a group of curved bars that were built out from a small butte, once an island in Lake Lahontan, by currents flowing out of Churchill Valley. A note-book sketch of these structures is reproduced below, on a scale of about 500 feet to 1 inch, which will serve to indicate the character of the phenomena found at this locality.

FIG. 21.—Sketch of gravel embankments in Churchill Valley, Nevada.

These bars or embankments are quite similar to those near Allen's Springs (see Plate XIX), and, as is so frequently the case, have been built from the bottom up; the highest in the series is the youngest. In examples of this nature, however, the deposits made as the waters fell may have been added to the surfaces of the older structures. This is indicated in the example shown in the sketch, by the fact that the outer scarp of the higher terrace *a* has been cut away, the material removed being spread out over the embankments *c* and *d*. In the illustration, *a* is about 20 feet below the Lahontan beach, while *b* is 20 feet lower. The surface of *c* is 25 feet lower than *b*, and on the same general level as *d*. Both *c* and *d* decline gradually in elevation towards the distal extremity. The longest of the bars has been truncated by the erosion of the waters which sometimes flow down the arroyo shown in the sketch.

In the northern part of the Lahontan basin, fine examples of water-built gravel embankments may be seen at the northern end of the Slumber-

ing Hills, and at the corresponding extremity of the Jackson Range; also, at the southern terminus of the Quinn River Mountains, and about Black Rock Point. All these localities were prominent headlands in the ancient lake, and were swept by strong currents which brought gravel and sand from the adjacent shore and deposited it on the salients of the land when the currents were forced into deep water

A note-book sketch of the embankment at the south end of the Quinn River Mountains is reproduced in the following diagram:

FIG. 22.—Sketch of gravel embankments at south end of Quinn River Mountains, Nevada.

The embankment is about 1,500 feet long, and at the point where the profile was sketched is 100 feet broad and 40 feet high. It projects from a salient where the current from Quinn River Valley left the shore on entering the strait between the Quinn River Mountains and the Slumbering Hills. The valley at this point is about 4 miles broad, and, during the existence of the ancient lake, formed a strait connecting two comparatively large water-

bodies. The embankment was built by currents from both the north and the west, and was carried out over horizontal lacustral beds, as represented in the sketch.

The buttes in King's River Valley were islands in Lake Lahontan and became surrounded by terraces, bars, and embankments that were built by the currents sweeping past them.

The topographic forms produced by the deposition of gravel in the paths of currents are extremely varied, and usually present curving contours and smooth, rounded crests, that are in marked contrast to the angular mountain slopes rising above them. Wherever the current-built structures of ancient lakes occur, one is sure to find an illustration of the striking contrast exhibited by the angular reliefs produced by subaërial erosion, and the rounded and flowing outlines resulting from the action of waves and currents. Aside from the bearing that these gravel embankments have on the geological history of the basin, one may always derive aid from them in determining the action of currents in existing lakes. The hydraulic engineer will do well to study the processes employed by nature to accomplish results that are frequently analogous to the works desired by man for improving navigation or providing a haven for shipping.

DELTAS.

The study of the records left by Lake Lahontan has added but little to our knowledge of deltas, for the reason that the lake was too inconstant in level to favor their formation, and also because nearly all the tributary streams entered the lake at the heads of narrow bays and estuaries, which were unfavorable localities for the development of structures of this nature. The Humboldt River entered the Lahontan basin at the head of a long, narrow arm of the old lake, which became deeply filled with *débris*, but is not now exposed in section. Farther southward in the same valley, between Mill City and Oreana, the Lahontan strata are well exposed, and will receive attention under the section devoted to sedimentary deposits. In the southern portion of the section to be seen in the banks of the Humboldt River there are inclined strata that have a striking resemblance to delta structure, but after a careful examination it was concluded that they owe their incli-

nation to their having been deposited by currents on the steep slopes of gravel embankments. That much of the material now filling the Humboldt Valley was brought down by the river, and is in reality of the nature of a delta deposit, there can be little doubt, but it has mostly been rearranged by currents and the topographic form of a delta is wanting. The same is true also of the accumulations at the points where the Truckee and Carson rivers entered the lake; about the ancient mouths of these streams there is a thickening of the river-borne *débris*, but no distinct delta forms are visible. The cañons of Buffalo and Smoke creeks were excavated to their present depth before the existence of the lake, and during the time the basin was flooded each of these channels formed a long narrow inlet which became deeply filled with sediments. When the lake's surface was lowered, the greater part of this material was removed by stream erosion; and so far as the history of their deltas is concerned, there is no more to be said than in the case of the larger rivers.

Nowhere in the Lahontan basin are deltas to be found that are comparable with those formed along the bold eastern shore of Lake Bonneville, or those deposited in the Mono Lake basin by streams that descended the eastern slope of the Sierra Nevada.

SECTION 3.—SEDIMENTS OF LAKE LAHONTAN.

The tributaries of lakes—disregarding organic substances—contain two classes of impurities, (a) mineral matter in suspension, and (b) mineral matter in solution.

Besides holding fine silt in suspension, streams also roll pebbles and stones along their beds. On entering a lake all this material subsides more or less quickly, forming lake-beds, gravel-deposits, etc. In the sedimentation of lakes the coarser and heavier *débris* is invariably dropped near shore, while the finer and lighter substances are floated to a greater distance before subsiding. In this manner coarse shore and fine off-shore deposits originate. The shore deposits of Lake Lahontan have already received

SEDIMENTS, NEAR OLDT. CANON.

SECTION 2. HISTORY OF LAKE LAHONTAN.

It is to be noted that the material deposited by currents on the steep slopes of the lake was not much of the material now filling the Humboldt River. That much of the material now filling the Humboldt River was brought down by the river, and is in reality of the nature of the material deposited there can be little doubt, but it has mostly been re-worked by currents and the topographic form of a delta is wanting. The accumulations at the points where the Truckee and Snake rivers entered the lake, about the ancient mouths of these streams, were the result of the river-borne *débris*, but no distinct delta forms were formed. The mouths of Buffalo and Smoke creeks were excavated to a great depth before the existence of the lake, and during the time the lake was in existence these channels formed a long narrow inlet which was filled with sediments. When the lake's surface was lowered, the greater part of this material was removed by stream erosion; and so far as the history of their deltas is concerned, there is no more to be said than in the case of the larger rivers.

In the Lahontan basin are deltas to be found that are comparable with those formed along the bold eastern shore of Lake Bonneville, or those deposited in the Mono Lake basin by streams that descended the eastern slope of the Sierra Nevada.

SECTION 3.—SEDIMENTS OF LAKE LAHONTAN.

The tributaries of lakes—disregarding organic substances—contain two classes of impurities, (a) mineral matter in suspension, and (b) mineral matter in solution.

Besides holding fine silt in suspension, streams also roll pebbles and stones along their beds. On entering a lake all this material subsides more or less quickly, forming lake-beds, gravel-deposits, etc. In the sedimentation of lakes the coarser and heavier *débris* is invariably dropped near shore, while the finer and lighter substances are floated to a greater distance before subsiding. In this manner coarse shore and fine off-shore deposits originate. The shore deposits of Lake Lahontan have already received

LAHONTAN SEDIMENTS, HUMBOLDT CANON, NEAR RYE PATCH, NEVADA.

some attention. In the present division the off-shore sediments, or lake-beds proper, together with certain interstratified gravels, will be described. The mineral substances contributed to the lake in solution will be studied in connection with its chemical history.

The sedimentary deposits of Lake Lahontan exhibit three definite divisions, viz.:

Upper lacustral clays.

Medial gravels.

Lower lacustral clays.

Wherever any considerable section of Lahontan sediments is exposed these three divisions appear in unvarying sequence.

The upper and lower members of the series are composed of marly clays, which show by their fineness and the evenness of their lamination that they were deposited in deep still water. The middle member, on the other hand, usually consists of well-rounded gravel and sand, in some instances becoming coarse and including boulders a foot or more in diameter. This deposit is current-bedded, and exhibits many variations, indicating that it was deposited in shallow water.

It is apparent, therefore, that the evenly stratified beds at the base and summit of the series are the records of a deep lake of broad extent, and mark periods of comparatively abundant precipitation or of greatly decreased evaporation. It is also evident that the medial gravels were deposited when the lake was sufficiently lowered to allow stream and current-borne *débris* to be carried far out over the previously formed lake-beds, recording an interval of low water in the history of the lake. The significance of these deposits in reference to Quaternary climatic changes will appear more clearly in the sequel.

Sections of Lahontan sediments are well exposed in those portions of the cañons of the Humboldt, Truckee, Carson, and Walker rivers that are below the highest water-line of the former lake; and as the sections observed present facts of interest in tracing the Quaternary history of the region, together with many illustrations of geological structure, we shall give somewhat detailed descriptions of the principal exposures.

The illustrations of sections accompanying the following pages were drawn by Mr. W J McGee, to whom I am also indebted for a number of the observations here included.

EXPOSURES IN THE CAÑON OF THE HUMBOLDT.

Between Golconda and Humboldt Lake the Humboldt River flows in a channel that it has excavated in Lahontan sediments since the last desiccation of the ancient lake. For a number of miles below Golconda the river is practically a surface stream, with low banks of marly clay belonging to the upper lacustral series. At Mill City its channel commences to deepen, and at Rye Patch the river flows a little more than two hundred feet below the general level of the desert. The general appearance of the gorge excavated by the river through the plain formed of lacustral sediments is shown in the accompanying illustration, Plate XXII, which is a reproduction of a photograph taken on the brink of the cañon, opposite Rye Patch. Throughout this portion of the cañon the tripartite division of the strata exposed in the steep banks is easily distinguished where not obscured by *débris* slopes. Below Rye Patch the banks decrease in altitude, and south of Oreana they are seldom more than 40 or 50 feet high, and only exhibit sections of the upper lacustral clays, with traces here and there of the medial gravels.

A section of the beds exposed in the sides of the Humboldt Cañon between Mill City and Lovelock Station, a distance of over 50 miles, is represented at the top of Plate XXIII. This section was compiled from about 25 detailed sections, which were first drawn at their proper place on the general diagram and then united in the manner that a somewhat extended study of the exposures seemed to dictate.⁴⁷ A few local sections, drawn with the same vertical and horizontal scale, are represented in the lower portion of the plate, and illustrate the diversity that prevails throughout the exposures. The most striking feature in the general section is the thickening of the deposits near Rye Patch, where they form an arch that once completely dammed the valley and was subsequently dissected by the river. The hypothesis framed by the writer in explanation of the phenomena ob-

⁴⁷ This illustration is perhaps open to the criticism that too much prominence has been given to the apparent plication of the strata.

served is that the beds were deposited by currents in the position they still retain during the time that the Humboldt Valley was occupied by the waters of Lake Lahontan. In other words, the inclined strata seen in the cañon walls are sections of current-formed embankments that have been buried beneath the upper lacustral marls. They are arches of deposition, and not plications due to orographic disturbance.

The formation of gravel embankments across narrow straits in such a manner as to completely close them has already been referred to in describing a structure of this nature at the lower end of Humboldt Lake (*ante*, page 108). The study of current-formed gravel deposits in a large number of the desiccated lake-basins of the Far West strongly favors the conclusion that the inclination of the strata exposed in the walls of the Humboldt Cañon is due entirely to their mode of accumulation. Could the gravel embankments familiar to us in many narrow valleys become buried beneath lake sediments and then exposed in cross-section by erosion, they would furnish examples of strata increasing in thickness at the same time that they became inclined and arched, which would in many ways be the counterpart of the phenomena illustrated by the section on Plate XXIII.

The hypothesis that the dip in the sections we are considering was due to plication, in the manner common to many older rocks, suggested itself early in the investigation, but did not find support in the facts observed.

The contacts of the lower and upper clays with the medial or gravel member of the series are nearly always unconformable. In many instances the surface of the lower marls was eroded into hollows and channels previous to the deposition of the gravels, and these are now filled with current-bedded *débris* in the manner illustrated by section K, Plate XXIII. Similar unconformities by erosion are also to be observed at many points where the contact of the medial gravels with the upper marls is exposed, as shown at I, on the same plate. Other illustrations of unconformity in the contact of the medial gravels with the evenly stratified beds above and below them are shown in the remaining detailed sections of Plate XXIII.

A comparison of the upper and lower clays indicates that they are very similar in their nature and were probably accumulated under nearly

identical conditions; they are both evenly laminated, fine-grained, drab-colored clays, that are usually marly and saline, and frequently exhibit a well-marked jointed structure. An analysis of a typical example of each, as reported by Dr. T. M. Chatard, shows that they do not differ more widely in composition than might be expected in two samples taken at different points in the same stratum.

Constituents.	Upper clays.	Lower clays.
Loss by ignition (water)	9.78	13.03
Silica (SiO ₂)	56.30	50.70
Alumina and ferrous oxide (Al ₂ O ₃ , and Fe ₂ O ₃)	21.60	19.01
Lime (CaO)	5.45	10.26
Magnesia (MgO)	2.64	3.19
Potassa (K ₂ O)	2.17	2.16
Soda (Na ₂ O)	2.60	1.91
Total	100.54	100.26

The upper clays differ from the lower, however, in the fact that at some localities they include interstratified beds of homogeneous, white, pumiceous dust, forming even layers from a fraction of an inch to several feet in thickness; and also a deposit of tufa in peculiar mushroom-shaped forms. The layer of fine marly clays on which the tufa stratum rests frequently teems with *Cypris* cases, and sometimes contains the shells of *Pompholyx effusa* in immense numbers; above the tufa the shells of *Anodonta nuttalliana* are frequently abundant. In the lower clays the relics of moluscan life are comparatively rare; and, so far as has been observed, they contain no deposits of volcanic dust; this, however, may be considered as an accidental circumstance dependent on the periods of eruption of distant volcanoes. The layer of tufa in the upper clays is a widely spread deposit indicating chemical conditions that so far as is known—the entire thickness of the lower clays not being exposed—did not occur previous to the formation of the medial gravels; although lenticular masses and thin sheets of tufa of a somewhat similar nature are not uncommon in the lower portion of the Lahontan section.

The medial gravels are in many places plainly divisible into two portions; the lower, composed of clean, well-worn, current-bedded sand and gravel, has all the structural characteristics of stream-bed and shore

formations; the upper is of a homogeneous, earthy character and has a striking resemblance to recent flood-plain deposits. The remarkable similarity of the middle member of the Lahontan section, as exposed in certain localities, to the bipartite—stream-bed and flood-plain—deposit formed by meandering streams, leads us to refer its origin with considerable confidence to similar causes. In some instances the earthy or flood-plain portion of the medial gravels is overlaid by current-bedded *débris*, which may reasonably be considered as the sheet of shore material spread out by the waves and currents during the rise of the lake that followed the formation of the middle member of the series.

The accuracy with which the accompanying detailed sections have been drawn, leaves little room for description; but in order to present still more definitely the facts on which they were based, descriptions of a few of the more instructive exposures are inserted. The lettering of the following sections indicates their position on Plate XXIII:⁴⁸

SECTION A.—*West bank of Humboldt River, 2 miles south of Oreana.*

	Feet.	
1. Æolian sand and dust, forming surface of the desert.	1	
2. Sand and gravel, massive.....	3	} Upper lacustral clays
3. Loam, sandy, laminated	2	
4. Marly clay, laminated and jointed	18	
5. Sand and gravel, cross-stratified	1	} Medial gravels.
6. Loam and sand, obscurely cross-stratified.....	5	
7. Sandy loam, massive; to river	3	
	33	

A double fault-line extends through the series, as shown on Plate XXIII. A similar double fault occurs 300 feet northward of the first, in the same vertical cliff (see Fig. 26, page 165), but the throw is in the opposite direction, showing that the whole included block, 300 feet long, has been bodily depressed 2 or 3 feet. The marly clays forming the upper portion of the section are, as usual, markedly unconformable to the gravels underlying them.

⁴⁸In making the drawings of detailed sections represented on Plate XXIII, the entire vertical range of the exposures observed was not represented.

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

SECTION B.—*West bank of Humboldt River, $\frac{1}{2}$ mile above Oreana.*

	Feet.
1. Marly clay, light colored, sandy.....	30
2. Marly clay, yellowish, fine-grained, laminated.....	4
3. Marly clay, light colored, sandy, like No. 1.....	4
4. Gravel, cross-bed, ferruginous.....	1
5. Marly clay, drab-colored.....	1
6. Gravel, cross-bedded, ferruginous.....	1
7. Marly clay, finely laminated, jointed.....	5
8. Marly clay, more sandy than No. 7, thick-bedded; to river.....	15
	61

The exposures in this portion of the cañon walls vary greatly as one follows them up or down stream. The middle member especially changes in both the character of the strata and their inclination.

SECTION C.—*West bank of Humboldt River, $2\frac{1}{2}$ miles above Oreana.*

	Feet.	
1. Sand and gravel.....	12	
2. Marly clays, white, laminated.....	12	} Upper lacustral clays.
3. Marly clays, brownish, loams.....	10	
4. Marly clays, white.....	25	
5. Gravel and sand, cross-stratified.....	25	Medial gravels.
6. Marly clays and loam; to river.....	10	Lower lacustral clays
	94	

SECTION F.—*West bank of Humboldt River, at Rye Patch.*

	Feet.	
1. Æolian sand and alluvial gravel, variable....	1 to 6	
2. Loam, sandy, light-colored, fine.....	12	} Upper lacustral clays.
3. "Tufa mushrooms" (dendritic tufa).....	0.9	
4. Ostracoid and gasteropod shells.....	0.2	
5. Sand, loamy, buff-colored, with small concretions of gypsum.....	16	
6. Gravel, rounded, cross-stratified.....	18.5	} Medial gravels.
7. Marl, buff-colored.....	6	
8. Gravel, cross-stratified.....	9	
9. Loam, with some cross-bedded gravel.....	7	
10. Gravel, cross-stratified.....	3	
11. Sand, cemented by carbonate of lime.....	0.4	
12. Loam, fine, cross-stratified.....	2	} Lower lacustral clays.
13. Sand, white, marly (much thicker in east wall of cañon).....	4	
14. Loam, with irregular strata of gravel.....	40	
15. Gravel, cemented.....	1	
16. Loam and fine gravel; to river.....	75	
	196 to 201	

The separation of the three members is more difficult to trace in this locality than is usual; the above divisions are somewhat arbitrary.

SECTION H.—*North bank of Humboldt River, 6 miles below Mill City.*

	Feet.	
1. Æolian sands, with some gravel, irregular in thickness.....		
2. Marly clay, white, regularly laminated, jointed....	15	Upper lacustral clays.
3. Loam, sand, and gravel, massive medially, cross-stratified above and below.....	12	} Medial gravels.
4. Marls, regularly laminated, light drab; to river...	10	
	37	Lower lacustral clays.

The medial gravels are markedly unconformable by erosion to both the upper and lower lacustral beds.

SECTION L.—*South bank of Humboldt River, Mill City.*

	Feet.	
1. Weathered marl, æolian sand at summit.....	2.5	
2. Marly clays, obscurely stratified, gray.....	3.0	} Upper lacustral clays.
3. Marly clays, white, laminated.....	3.0	
4. Marly clays, sandy, brownish, obscurely cross-stratified.....	2.5	
5. Marly clay, white, laminated, jointed.....	9.0	
6. Sand and gravel, somewhat ferruginous, fossiliferous.....	0.5	} Medial gravels.
7. Sand, gravel, and pebbles, cross-stratified.....	5.0	
8. Sand and loam, massive, with pebbles.....	5.0	
9. Sand and loam, obscurely and irregularly stratified.....	4.0	
10. Sand and gravel, with ferruginous current.....	0.3	
11. Sand, cross-stratified, fine.....	3.0	} Lower lacustral clays.
12. Marly clays, regularly laminated, ash colored, jointed, with some tufa at summit; to river....	3.0	
	40.8	

The tufa in the lower lake-beds occurs in uniform lenticular nodules, in places forming a continuous layer an inch or two thick. Dendritic tufa, in the form of mushrooms, occurs in the upper lake-beds above No. 5, near where this section was taken.

EXPOSURES IN THE CAÑON OF THE TRUCKEE.

The sedimentary deposits accumulated in Lake Lahontan are also well exposed in its precipitous banks of the Truckee River from the point where it enters the basin of the former lake, about 15 miles westward of Wadsworth, to its termini in Pyramid and Winnemucca lakes. Above Wadsworth the exposures are entirely of upper lacustral clays, which occur in fragmentary masses on the sides of the cañon in places where they have

been sheltered from erosion. The western bank of the Truckee just below Wadsworth, and 2 or 3 miles from the gorge through which the river enters the valley, is about a hundred feet high and exposes the following diversified sections:

	Feet.
1. Æolian sands	5 to 18
2. Sandy clay, fine, evenly stratified	12
3. Clay, drab-colored, fine-grained, homogeneous	6
4. Clay, evenly stratified, ferruginous	1.5
5. Sand, argillaceous, in contorted strata	3
6. Sand, fine, clean, sharp	2.5
7. Clay, sandy, ferruginous, jointed	2
8. Sand, coarse and pebbly	5
9. Clay, argillaceous	2
10. Sand, ferruginous	10
11. Clay, drab-colored, with seams of fine sand	2
12. Sand and gravel, micaceous	10
13. Gravel, well rounded, with seams of sand and occasional boulders sometimes 2 feet in diameter	6
14. Sand, evenly stratified, micaceous, ripple-marked	2
15. Sand, sharp, clean, micaceous	12
16. Sand, evenly stratified, micaceous, ripple-marked and current- bedded; passing into—	3
17. Clay, fine, evenly stratified, drab-colored, sometimes sandy; jointed by two systems of fractures nearly at right angles, and resting un- conformably upon—	6
18. Gravel, well rounded, current-bedded, and containing boulders 2 feet in diameter; to river	20
	110 to 123

The numerous changes recorded by this section are no doubt to be accounted for by the proximity of the former mouth of the river, from which the greater part of the *débris* forming the beds was derived.

A noticeable feature of the section is the fine exhibition of double jointing to be seen in bed No. 17. This stratum is of compact and nearly homogeneous, sandy clay, resting on a thick deposit of unconsolidated gravel and boulders, and overlain by similar material. As the inclosing beds are too loose and incoherent to exhibit jointed structure it seems evident that the forces producing the joints must have originated in the clays themselves; for it is difficult to understand how external agencies, as an earthquake shock for example, could have been transmitted through the loose gravel deposits inclosing the clays. The jointed stratum to which we have called attention apparently represents the lower lacustral clays, but as the section is rendered abnormal by its proximity to the ancient mouth

of the Truckee River, the three divisions of Lahontan sediments so easily recognized in many localities are here indefinite.

Continuing towards Pyramid Lake with our study of the exposures in the river banks, we find the section changing in its details and losing the complex character observed at Wadsworth. Beginning a mile or two below the position of the section given in detail above, and continuing for four or five miles down the river, the exposures are almost entirely of upper lacustral clays, including a few irregular strata of current-borne material. This is indicated by the following section observed on the west side of the river about four miles below Wadsworth:

	Feet.
1. Æolian sand	1 to 2
2. Dendritic tufa in mushroom-forms	1 to 1.5
3. Clay, fine, sandy, ferruginous.....	4
4. Clay, compact, drab-colored	12
5. Sand, fine, ripple-marked	1
6. Clay, fine, evenly stratified.....	2
7. Sand and gravel, current-bedded	1
8. Clay, drab-colored	8
9. Sand, ripple-marked	1
10. Clay, evenly stratified, with some sandy layers; to river.....	100

Near the locality where this section was observed, but on the opposite side of the stream, the lower fifty feet of the cañon wall are composed of coarse gravel which evidently represents the middle member of the Lahontan series; half a mile down stream, however, the entire section is again composed of lacustral clays.

Other abrupt changes of this nature are common and seem to indicate that the medial gravels occupy an old eroded channel in the lower clays, which is crossed irregularly by the present stream channel.

Continuing down stream, one finds good exposures of the upper clays resting on coarse current-bedded gravels which are without question a portion of the middle member of the series. The medial gravels are here probably represented in part by a heavy deposit of reddish-brown *débris*, somewhat coarser than the normal lacustral clays and having a close resemblance to the upper or flood-plain portion of the medial gravels observed in the Humboldt section. On the east side of the river this deposit becomes thinner as we follow it westward, and at length disappears in a thin wedge,

at the same time increasing in thickness in the west bank of the cañon, until it finally composes the entire section of more than a hundred feet.

Just before the Truckee Cañon opens out into the valley occupied by Pyramid and Winnemucca lakes, it becomes quite narrow, and is bounded on either side by rocky walls; for convenience of reference we have called this the "Truckee Narrows." From this point to the Agency Bridge, a distance of about four and a half miles, the walls of the cañon exhibit a continuous section in which the tripartite character of the Lahontan sediments is strikingly displayed. The exposures actually observed on the east side of the stream have been sketched by Mr. McGee and form Plate XXIV. The most instructive feature illustrated by this section, as is the case of the exposures along the Humboldt, is the fact that it consists of two series of fine homogeneous strata, separated by a heavy deposit of heterogeneous, current-bedded gravels. A generalized section of the beds here exposed agrees in a remarkable way with the similar sections observed in the Humboldt Cañon. The upper and lower lacustral clays occurring in the Truckee section, like those exposed in the banks of the Humboldt, show but little variation. They are composed of fine, evenly laminated, drab-colored, marly clays, that are somewhat saline and alkaline as indicated by chemical tests. On the west side of the river near the Agency Bridge, however, the upper clays show some variation, especially near their contact with the underlying gravels, as is exhibited with considerable detail in the section forming Plate XXV.

One of the most instructive portions of the Truckee section is a stratum of dendritic tufa interbedded with the upper clays. At the northern end of the section, *i. e.*, towards the deeper portion of the lake in which the sediments of tufa were deposited, the tufa-stratum is but 3 inches thick and is buried beneath 25 or 30 feet of laminated clay; when followed shoreward, or up stream in reference to the present drainage, the tufa gradually increases in thickness, at the same time approaching nearer the surface of the section, until at the Narrows of the Truckee it forms a sheet of huge mushroom-shaped masses at the top of the bank, which are from 10 to 15 feet in diameter and so thickly planted that they form a continuous pavement fully 10 feet thick. The rocks at the Narrows above the level of the lacustrine deposits are

coated with a continuation of the same tufa sheet, the upper limit of which is about 200 feet below the highest of the ancient water-lines engraved on the sides of the valley. The tufa interstratified with the upper clays almost invariably starts from small nuclei, and, forming dendritic branches, spreads out above into dome or mushroom-shaped growths; in some instances the tufa is prolonged downward below the general level of the stratum to which it belongs, and forms irregular vase-shaped masses below the continuous tufa layer. Immediately below the tufa, and sometimes adhering to it, are great quantities of *Cypris* and gasteropod shells, and occasionally bones of fishes, indicating that the waters from which the calcium carbonate forming the tufa was precipitated were far from being concentrated saline solutions.

Throughout the section, the contact of the medial gravels with both the underlying and the overlying clays is unconformable, owing, in each case, to the erosion of the lower member, as is well shown in Figs. A, C, and D, Plate XXVI, which are accurate sketches of observed exposures, and illustrate the filling of channels, formed principally by erosion, with current-bedded gravel.

The lacustral clays forming the lower portion of the section are, in places, exposed to the depth of 100 feet, but what their total thickness may be it is not possible to determine from the present exposures. When examined at some distance from the shore of the basin, they exhibit little variation, and are normally finely laminated, marly clays. An exception is found, however, a short distance above the Agency Bridge, on the east side of the river, where a rounded boulder of hard volcanic rock from $2\frac{1}{2}$ to 3 feet in diameter occurs several feet below the top of the lower clays. This is a much larger block than any seen in the medial gravels, and evidently must have been floated to its present position, probably through the agency of ice. Although rounded and worn it did not exhibit striations or planed surfaces, and gave no proof that it had ever been subject to glacial action.

In places, the lower clays exhibit contortions which in some instances can only be accounted for by a movement of the beds since their deposition, caused apparently to the weight of the superimposed masses of gravel and clay. In other exposures the contortions and convolutions of the laminated

deposits are apparently due to their having been formed in agitated waters; just how the intricate folds and contortions were produced, however, it is extremely difficult to explain.

In a few localities the lacustral clays, especially below the medial gravels, are faulted; and at times the strata on one side of a fault have been thrust over the beds forming the opposite wall, as indicated at the left on Plate XXV. In this instance the projecting strata seem to have been removed by erosion previous to the deposition of the superimposed clays.

The medial gravels in the Truckee section vary from 25 to 100 feet in thickness, and exhibit great diversity both in composition and structure, thus indicating many variations in their mode of formation. Examples of cross-bedding are abundant, and the presence of arched strata and lines of unconformability, as well as the irregularity of the beds and the manner in which they wedge-out and are replaced by others of a somewhat different nature, all tend to show that the entire middle member of the Lahontan series here exposed was deposited in shallow, current-swept waters. The arches seen in the cañon walls are, apparently, cross-sections of current-built embankments, while the irregular layers of fine sediment are proof, on the other hand, of more quiet condition during which the fine silt held in suspension was allowed to subside. The general conclusion that the medial gravels were formed during a time of low water, separating two periods when the lake was broad and deep, cannot be questioned by any one who has examined the records exposed in the Truckee section, which, as previously stated, are in harmony with the similar evidence furnished elsewhere in the basin of the ancient lake.

On following the Truckee River from the Agency Bridge to its mouth, one finds its banks becoming low, and exposing, for the most part, only portions of the upper clays; in a few localities, however, limited sections of the medial gravels may be seen, thus showing that the valley could not have held a lake much, if any, larger than that of the present day during the time that the medial member of the Lahontan series was being deposited.

SECTION OF LAHONTAN SEDIMENTS, AGENCY BRIDGE, TRUCKEE RIVER, NEVADA.

EXPOSURES IN THE CAÑON OF THE CARSON RIVER.

During the highest stages of Lake Lahontan its waters extended up the Carson River Valley as far as Dayton, and occupied it long enough to allow large quantities of lacustral beds to accumulate. When the lake evaporated and the river regained its ancient channel, these beds were deeply dissected by erosion. The remnants of Lahontan sediments to be seen in the valley belong mostly to the upper lacustral clays, but in places they were observed to rest on gravel deposits. The sections obtained, however, were imperfect and far less satisfactory and instructive than those described in the preceding pages. The lacustral beds exposed along the banks of the Carson, and flooring Churchill Valley, are fine, light-colored marly-clays, similar in all respects to the corresponding beds observed at many localities throughout the Lahontan basin. Interstratified with these sediments is a deposit of dendritic tufa, sometimes 3 or 4 feet in thickness, which is well exposed in the narrow channel connecting Churchill Valley with the Carson Desert. This deposit corresponds both in structure and position to the interstratified tufa-layer observed in the Humboldt and Truckee cañons.

So far as known, the lacustral beds observed along the Carson River are undisturbed by post-Lahontan movement, and have nowhere been dissected sufficiently deep to lay open the sediments accumulated during the first rise of the lake.

The Carson River rises on the eastern slope of the Sierra Nevada and flows northward through Carson and Eagle valleys, which are in reality a single basin, and enters a deep and all but impassable cañon, through which it flows with a rapid descent as far as Dayton. It then enters a valley 2 or 3 miles broad—once an arm of Lake Lahontan—which contracts again to a narrow cañon at its southern end. In the course of a few miles this cañon again expands and forms Churchill Valley, which in its turn connects with the Carson Desert through a narrow channel now occupied by the Carson River. The contractions in the lower portion of the river channel are probably due in a great measure to erosion, but are less plainly stream-carved channels than the deep gorge above Dayton. Since Lake Lahontan during its highest stages occupied the valley as far as Dayton, we are safe in con-

cluding that the river channel was carved in pre-Lahontan times, and also that the lake which occupied Eagle-Carson Valley must have overflowed and cut down its channel of discharge so as to drain that basin to the bottom previous to the existence of Lake Lahontan. We make this departure from our immediate subject for the purpose of showing that the sediments of the Eagle-Carson Lake, in which a variety of foot-prints have recently been discovered at the Nevada State Prison, are older than Lake Lahontan, and probably belong to early Quaternary or late Tertiary times.

EXPOSURES IN THE CAÑON OF WALKER RIVER.

The Walker River, in its course between Mason Valley and Walker Lake, flows through a comparatively narrow valley, which was deeply filled with Quaternary lake sediments and is now a desert, sage-brush-covered plain, dissected through the center by a cañon eroded by the present stream since the evaporation of the former lake. Like the Humboldt, the Truckee, and the Carson, the Walker River has exposed sections of Lahontan sediments, in which the tripartite division is well displayed. As in the former instance, the upper and lower members are fine, evenly laminated, marly-clays, which were evidently accumulated in quiet waters, and are separated by a heterogeneous accumulation of sand and gravel that records an interval of low water.

The tendency of current-borne *débris* to accumulate in narrow straits connecting broad water-bodies has already been discussed in connection with the descriptions of the gravel deposits observed in the Humboldt and Truckee cañons. A gravel embankment similar to those already described occurs a few miles northward of Walker Lake and forms the divide between Walker Lake and Walker River valleys. In this instance a large embankment was built completely across the mouth of the narrow strait that formerly connected the open waters of Walker Lake and Mason valleys; subsequently this structure was cut through by waters flowing from the northward, thus revealing a section of the inclined and arched strata in which the gravels were deposited.

A generalized section compiled by Mr. W J McGee, from many detailed observations, is reproduced in Fig. C, Plate XXVIII, which represents the

DETAILED SECTION OF LAHONTAN SEDIMENTS, TRUCKEE CAÑON, NEVADA.

structure of the Lahontan sediments exposed in the cañon walls for a distance of 18 miles. The highest point in the section is at the crest of the embankment, which crosses the valley and marks approximately the level of the highest water stage of the former lake. Between the embankment mentioned above and Walker Lake, a distance of 8 miles, the river banks vary from zero at the lake to 50 or 60 feet in the neighborhood of the embankment. In this interval the exposures are almost entirely of upper lacustral clays, with intercalated beds of volcanic dust, but at a few localities, in the northern portion of the section, the medial gravels and underlying clays may be seen at the base of the escarpment bordering the river. Where the stream-channel crosses the embankment, the entire exposure, 200 feet high, is composed of inclined and arched strata of sand and gravel inclosing irregular and loamy beds. The entire series has a characteristic pinkish tint due to the presence of iron oxide. This embankment occurs unconformably between the upper and lower clays, and, like many similar structures when seen in section, exhibits anticlinals of deposition. Its base is not exposed to view, but as the clays of the lower series occur near at hand, both to the north and south, it seems probable that the gravels composing the embankment were, at least in part, accumulated during the time the lower clays were being deposited. Like the embankment at the southern end of Humboldt Lake, this structure was probably begun early in the history of Lake Lahontan, and has been enlarged many times since. The last addition was contemporaneous with the deposition of the upper clays, or perhaps in part subsequent to it; in the main, however, it is composed of the medial gravels of the Lahontan series. Northward from the crest of the embankment the cañon walls decrease in height, as represented in Fig. C, Plate XXVIII, all the way to Mason Valley, where the river becomes a surface stream. The medial gravels are exposed for about 8 miles north of the embankment, and appear again at a point where they have suffered some local disturbance about 4 miles below the point where the river leaves Mason Valley.

Throughout the entire exposure of lower lacustral clays observed in the Walker River Cañon, the strata are of light-colored, laminated, marly clays, of the same nature as the corresponding beds occurring in the Hum-

boldt and the Truckee cañons, and therefore do not require farther description. The medial gravels, in common with lacustrine shore deposits in general, are heterogeneous accumulations of worn and rounded sand, gravel, and boulders, with occasional inclusions of finer *débris*; cross stratification prevails, and many of the beds were deposited in an inclined position.

The upper lacustral clays in the Walker River section are more varied and indicate more complex conditions of deposition than the similar exposures that have been described in the preceding pages. The upper and lower portions of the upper clays have the normal features of the deposit, but an intermediate portion, varying 20 to 30 feet in thickness, is of a more diversified character, and includes strata of sand and gravel which are frequently iron-stained and in many places form contorted and folded layers.

This portion of the upper clays obtained the name of the "bone-bed" in our field notes, from the numerous mammalian remains that it contains (see Chapter VI). It is exceptional in the Lahontan series, and evidently must have been formed under peculiar conditions. The only hypothesis which seems to furnish assistance in interpreting the phenomena observed assumes that the embankment dividing Walker River and Walker Lake valleys formed a dam in late Lahontan times that obstructed the free circulation of the waters occupying the two basins and caused the region above the obstructions to become a swamp or a shallow lake in which the iron-stained deposits of varying character containing mammalian remains were accumulated. Afterwards the lake rose sufficiently to flood the valley and allow homogeneous, fine-grained clays to accumulate. In this portion of the deposit the shells of *Margaritana margaritifera* are abundant. The surface of the upper clays over large areas both in Walker Lake and Walker River valleys is coated with an abundance of dendritic tufa, which occurs both in mushroom-shaped masses that have formed about small nuclei and in irregular vertical sheets which penetrate the clays and in some instances inclose considerable areas. These sheets of tufa seem to have formed on the sides of fissures, or perhaps on eroded surfaces which had been submerged, in such a manner as to take an accurate cast of the beds against which they were deposited. The upper clays in the Walker River section correspond not only in their composition and arrangement

W. J. McGee, Del.

I. C. Russell, Geologist.

SECTIONS OF LAHONTAN SEDIMENTS IN WALKER RIVER CANON NEVADA.

with the similar beds in other parts of the Lahontan basin, but they contain the same species of fossils. Their tufa deposits in various parts of the old lake basin record similar chemical conditions.

The following section observed in the left bank of the Walker River, about two miles above the gravel embankment shown on Plate XXVIII, represents the prevailing character of the exposures to be seen in this region:

		Feet.
	Æolian deposits forming desert surface	1 to 10
Upper lacustral clays..	{ Light-colored marly clays, passing into ferruginous sandy beds, sometimes contorted, containing detached mammalian bones; changing to marly clays at the base.....	40 to 50
	<i>Contact unconformable.</i>	
Medial gravels.....	Gravels and loam, colored with iron	25 to 30
	<i>Contact unconformable.</i>	
Lower lacustral clays ...	Light-colored marly clay; to river	75

The sections taken at various points along the Walker River show great variation, but the differences are caused almost entirely by the want of constancy in the medial gravels; the upper and lower members of the series are remarkably uniform throughout. In the majority of cases where the upper or lower contacts of the medial gravels could be seen they were found to be unconformable with the adjacent beds.

The most difficult problems presented by the superficial geology of the Walker River Valley are in connection with the orographic disturbances that have affected the region in post-Lahontan times. The valleys occupied by Walker Lake and Walker River are of the Great Basin type, and owe their formation to pre-Lahontan faulting; the main displacement that gave origin to the depressions—which are structurally a single basin—follows its western border and determines the extremely precipitous eastern face of the Walker Lake or Wassuck Mountains. Other faults, less plainly distinguishable; occur on the eastern border of the valley, especially near its northern end, and connect with the displacements to be seen in Mason Valley. Some of these ancient fault lines, including the largest of all—that following the western border of the valley—appear at the surface within the basin of the former lake; in such instances a post-Lahontan movement of the ancient

displacements is usually indicated by fresh scarps in lacustral clays and gravels. Since the desiccation of Lake Lahontan there has been considerable movement along some of these ancient lines of fracture, and the Lahontan beaches and terraces no longer retain their normal position, but in places have been carried far above the horizon which they originally occupied. If we consider the crest of the gravel embankment separating Walker Lake Valley from the valley occupied by Walker River as approximately the original level of the Lahontan beach, we find that the eastern end of the structure, as determined by Mr. McGee, is now fully 200 feet above its original position, as indicated at x' , Plate XXVIII. The only explanation of this phenomenon the writer can offer is that the fault following the eastern border of the valley has increased its displacement in post-Lahontan times and carried the shoreward portion of the bar above its normal position. Similar disturbances may be seen in the northern part of the same valley, where a post-Lahontan fault occurs on each side of the basin exposing characteristic sections of Lahontan sediments. The altitude of the beach on the eastern side of the valley is indicated at x , Plate XXVIII. In the bottom of the valley and near the northern end, the strata are arched as indicated in the generalized section. From the limited section open to examination, this seems to be a variable anticlinal, and, if so, it is the only post-Lahontan arch of this nature that has been observed. The movements that produced the disturbances in the northern part of the Walker River Valley are connected with the recent displacements to be seen in the vicinity of the hot springs in Mason Valley, and are so indicated on Plate XLIV.

Local faults affecting the Lahontan sediments are of frequent occurrence, especially in the lower portion of the Walker River Valley; the throw of these displacements is seldom over 40 or 50 feet, and they have caused but little change in the topography of the valley. They are of different dates, as is illustrated by figures A and B, Plate XXVIII; in the former, the displacement took place previous to the deposition of the medial gravels; and in the latter, after the upper clays had been deposited.

We have described the orographic movements in this region in somewhat general terms, for the reason that it is difficult to describe the facts on

which our conclusions rest with as much accuracy as could be desired, and also because the subject will claim further attention in connection with other orographic disturbances that have affected the Lahontan basin.

GENERALIZED SECTION OF LAHONTAN SEDIMENTS.

On grouping the numerous sections of Lahontan sediments observed in the Humboldt, Truckee, Carson, and Walker cañons, we have the following generalized section of sedimentary deposits formed in the ancient lake:

	Average thickness, in feet.
Upper lacustral clays:	
Evenly laminated marly clays, fine and homogeneous, usually saline; with interstratified bands of dendritic tufa near the top; in places containing intercalated layers of volcanic dust. In some places this member is divisible into three parts, the upper and lower being normal clays, while the intermediate member is more sandy, and usually contains iron-stained lyse, that are frequently contorted	50 to 75
Fossils: <i>Cypris</i> , <i>Anodonta</i> , <i>Margaritana</i> , <i>Sphærium</i> , <i>Pisidium</i> , <i>Helisoma</i> , <i>Gyraulus</i> , etc., together with mastodon or elephant, horse, and camel.	
<i>Contact unconformable.</i>	
Medial gravels:	
Cross-stratified sand, gravel, and loam, in beds that are irregular both in thickness and inclination, frequently forming arches of deposition. At times exhibiting two plainly marked divisions; the upper being a compact, earthy, homogeneous, flood-plain deposit; the lower clean, well-rounded sand and gravel, at times strongly cross-bedded..	50 to 200
Fossils: <i>Anodonta</i> , <i>Gyraulus</i> , <i>Lymnophysa</i> , <i>Pompholyx</i> .	
<i>Contact unconformable.</i>	
Lower lacustral clays:	
Laminated marly clays, very similar to the clays at the summit of the section. The clays throughout the section frequently exhibit two systems of joints at nearly right angles to each other (full thickness not exposed).....	100
Fossils: <i>Pompholyx</i> .	

The interpretation of this section gives an outline of the later Quaternary history of the Lahontan basin; but as the base of the lower clays is nowhere exposed, all the changes that may be recorded by the lower strata remain unknown. From the sedimentary deposits observed we learn that there have been two high-water periods in the history of the Lahontan basin, during which fine clays were deposited. Separating these two periods was a time when the lake was low and allowed current-borne gravels to be carried far out over the previously formed lake-beds. During the second flooding the waters underwent long concentration, and at a certain period deposited a vast quantity of tufa; the lake during this stage also received

large quantities of pumiceous dust, which must have been thrown out by some volcano in the state of violent eruption. The second rise of the lake was followed by the present period of desiccation, which witnessed the evaporation of its waters and the exposure of its sediments to subaerial erosion. The rivers in flowing across the exposed lake-beds carved the deep channels we have described, and are now spreading stream and current borne gravels far out in the central portions of the valleys, thus in many ways repeating the conditions that characterized the time during which the medial gravels were deposited.

In order to represent the sediments of Lake Lahontan on a geological map of the region one has but to color the area once occupied by the lake with the appropriate tint. The older rocks throughout the area are not completely concealed by the sediments of the lake, however, the exceptions occurring along the borders of the basin and about isolated buttes; but these portions being usually precipitous, the belt left unconcealed is so narrow that it would be scarcely possible to represent it on a geological map of the scales ordinarily used.

To prevent confusion it seems appropriate to indicate at this time some discrepancies that exist between the published reports of the United States Geological Exploration of the Fortieth Parallel and the conclusions presented in the present volume. On map V of the atlas issued for that exploration a large portion of Lahontan basin is included. The area covered by the sediments of Lake Lahontan, as determined by the present survey, are there indicated in four different ways. Some portions are represented as Truckee Miocene, others as Humboldt Pliocene, while the greater part is divided between Upper and Lower Quaternary.

The areas colored as Truckee Miocene are situated at the lower end of Humboldt Lake and at the southern end of Winnemucca Lake. The deposits at these localities are similar, consisting, if the writer's determinations are correct, of gravels that were accumulated in the form of bars or embankments through the action of the currents of the Quaternary lake. The some deposits about the south shore of Humboldt Lake have been described at length in the preceding pages (105 to 112), and a detailed map of the area

presented on Plate XVIII. The embankments near the south end of Winnemucca Lake are described on page 120. The discrepancy in reference to the nature of the gravel deposits bordering Humboldt Lake may be seen by comparing the pages referred to above with the description given on page 742 of Vol. II of the reports of the United States Geological Exploration of the Fortieth Parallel.

The entire area represented as Humboldt Pliocene, on map V of the atlas cited, has been considered throughout the present volume as of Quaternary age, and as furnishing the most typical exposures of Lahontan sediments, as will be seen by referring to the descriptions of the Humboldt and Truckee cañons.

The areas colored as Lower Quaternary on map V, of the atlas named, are mostly playa-deposits; while the areas designated as Upper Quaternary are largely covered with alluvial gravel, especially near the mountains, but in the broader valleys within the Lahontan area large portions thus designated are floored with Lahontan sediments. In the present report Upper and Lower Lahontan clays have been recognized; these might with propriety be termed Upper and Lower Quaternary, but cannot be correlated with the Upper and Lower Quaternary of King. The exposures of upper and lower Lahontan sediments are so limited, occurring mostly in cañon walls, that they could scarcely be represented on a map of the scale used in that atlas, and if mapped they would not agree with the classification of the Quaternary there used. As the facts are interpreted by the present writer, the lake beds there mapped as Lower Quaternary belong to Upper Quaternary, while the playas also mapped as Lower Quaternary are recent. The alluvial deposits, there mapped as Upper Quaternary, are deep formations whose accumulation began at least as early as the Tertiary and has been continued to the present time. Their surface layers are in part modern, but other areas have received no recent additions and are superficially Upper Quaternary.

EXCEPTIONAL SEDIMENTARY DEPOSITS.

PUMICEOUS DUST.

In describing the section of upper lacustral clays observed in the Humboldt, Truckee, and Walker River cañons, strata of fine silicious material, varying in thickness from a fraction of an inch to five or six feet, were noted at a number of localities; it is now our intention to describe these abnormal deposits more fully.

In all the exposures of this material the same characteristics were observed. The beds are composed of a white, unconsolidated, dust-like, silicious substance, homogeneous in composition, and having all the general appearance of pure, diatomaceous earth. When examined under the microscope, however, it is found to be composed of small, angular glassy flakes, of a uniform character, transparent and without color, but sometimes traversed by elongated cavities. When examined with polarized light, it is seen to be almost wholly composed of fragments of glass, with scarcely a

4. Volcanic dust from Brakleat-Hill in Saugus, Mass., pre-Carboniferous.

FIG. 23.—Volcanic dust.

trace of crystal or of foreign matter. On comparison with volcanic dust that fell in Norway in 1875, derived from an eruption in Iceland, with the dust erupted in Java in 1864, and the similar material ejected in such quantities from Krakatoa in 1883, it is found to have the same physical characteristics; but it is much more homogeneous, and, unlike the greater part of the recent dust examined, is composed of colorless instead of brown or smoky glass. In the following figure, which we copy from

Mr. J. S. Diller's instructive article on the volcanic sand which fell at Unalaska, October 20, 1883,⁴⁹ the microscopic appearance of volcanic dust, from various localities and of widely different geologic age, is shown with accuracy. The peculiar concave edges and acute points of the shards of glass render it evident that they were formed by the violent explosion of the vesicles produced by the steam generated in the viscid magma from which the glass was formed, and were not produced by the mere attrition of the fragments during the process of eruption. It is noteworthy that the dust erupted from Krakatoa but yesterday is undistinguishable in its main characteristics from the material of a similar origin which fell in the waters of Lake Lahontan during the Quaternary, or from the dust thrown out by some unknown and long since extinct volcano in the vicinity of the Atlantic coast, which fell near the site of Boston during pre-Carboniferous or possibly in pre-Cambrian time. The volcanic phenomena of to-day are governed by the same laws as obtained at the dawn of geologic history.

Farther study revealed that even the finest of the dust obtained from the basin of Lake Lahontan has identically the same physical properties as pumiceous rhyolite forming the Mono Craters, ground in a mortar to a corresponding fineness; under the microscope the two powders were very similar.

The dust deposits are rich in silica, as shown by the following analysis, by Dr. T. M. Chatard, of a sample collected in the bank of the Truckee River near Pyramid Lake; for comparison we give also an analysis, by the same chemist, of a specimen of pumiceous rhyolite from the Mono Craters:

Constituents, etc.	Volcanic dust.	Pumiceous rhyolite.
Loss by ignition (water).....	3.91	2.20
Silica (SiO ₂).....	71.15	74.05
Alumina (Al ₂ O ₃) and iron (Fe ₂ O ₃).....	15.95	13.85
Lime (CaO).....	0.85	0.90
Magnesia (MgO).....	0.41	0.07
Magnesia (MnO).....	Trace.	
Potash (K ₂ O).....	3.36	4.31
Soda (Na ₂ O).....	4.94	4.60
	100.57	99.98

The striking similarity in the composition of the above samples (especially when allowance is made for the greater percentage of moisture

⁴⁹ Science, Vol. III, p. 652.

in the specimen of dust, and the fact that it has been exposed to the action of solvents much more than the rock remaining in the crater walls) strongly favors the assumption that they had a common origin.

More extended operations in the field revealed that beds like those described above are not confined to the Lahontan basin, but are found as superficial deposits above the Lahontan beach at many localities and at points far distant from the old lake margins. Accumulations of the same nature occur in the Mono Lake basin, interstratified with lacustral deposits, and were also found in the cañons about Bodie at a considerable elevation above the level of the Quaternary lake that formerly occupied Mono Valley. About Mono Lake these deposits are frequently of a coarser texture than those found farther northward, and, at times, graduate into strata which reveal to the eye the fact that they are composed of angular flakes of obsidian.

The Mono Craters form a range some 10 or 12 miles long, which extends southeastward from the southern shore of Mono Lake, and in two instances attains an elevation of nearly 3,000 feet above the lake. A few coulées of dense, black obsidian have flowed from them, but the great mass of the cones is formed of the pumiceous obsidian which occurs both as lava-flows and ejected fragments, the latter forming a light lapilli which gives a soft gray color to the outer slopes of the craters. Fragmental material of the same nature has been widely scattered over the mountains and on the ancient moraines that occur in the Mono basin, while fine dust, unquestionably derived from the same source, may be traced to a still greater distance.

From the evidence given above we conclude that the strata of fine, siliceous, dust-like material occurring in the Lahontan sections, as well as the similar beds found about Mono Lake and scattered as superficial deposits over the neighboring mountains, are all accumulations of volcanic dust, which was probably erupted from the Mono Craters.⁵⁰ The greatest

⁵⁰This material could not have been erupted from the craters in which the Soda Lakes, near Ragtown, are situated, as these volcanoes are formed of quite different and more heterogeneous material. The fragments of scoria ejected from these vents are composed of basalt in which grains of olivine are conspicuous.

distance from the supposed place of eruption at which these deposits have been observed is about 200 miles.

The resemblance between the volcanic dust described above and very pure diatomaceous earth is so close that it is difficult to distinguish one from the other by a cursory examination; with the aid of the microscope, however, the difference is at once apparent, as the dust seldom shows even a trace of any organism mingled with it.

WHITE MARL.

At a number of localities in the Lahontan basin there are exposures of white, chalky marl which does not appear in the cañon sections we have described, but is exposed locally, mostly on the sides of the basin, and evidently indicates peculiar conditions of the waters in which it was accumulated.

White marls were first observed in the Lahontan basin at the southern end of the desert valley, which is connected with the Carson Desert by the narrow pass in which Allen's Springs are situated; during the higher stages of the ancient lake this valley formed a land-locked bay. That the waters did not extend through the pass at the southern end is shown by a series of barrier-bars at about the horizon of the Lahontan beach, which sweep about this portion of the ancient shore in graceful curves. These concentric gravel ridges, or barrier-bars, record a gradual recession of the waters which once filled the valley, and are especially noticeable from the neighboring hills when the slanting, afternoon light brings out their symmetric forms in bold relief. Modern drainage has cut a channel through them in a direction at right angles to their general trend, and exposed the following section:

	Feet.
Well-worn gravel, forming barrier bars.....	15 to 25
Fine sand, cross-bedded	8 to 10
Finely laminated, white, chalky marl	
Gravel, well rounded, ferruginous	1 to 2
Fine sand; to bottom of exposure	1 to 2

The marl at this locality is by aneroid measurement 175 feet below the Lahontan beach, and may be traced for a hundred yards or more along the sides of the arroyo. At both its lakeward and shoreward margin it becomes

impure from the intermingling of sand and gravel, and finally wedges out and is replaced by water-worn *débris* like that forming the bars. It seems to form a lenticular mass, filling a local basin, but the section does not give complete proof that such is the case. Our observations would apply equally well to a low off-shore embankment built by gentle currents, and subsequently buried by ordinary shore-drift. The gravel bars resting on the marl were formed during a subsequent rise of the waters and were never afterwards submerged; consequently the marl must have been deposited previous to the last high-water stage of Lake Lahontan. This will be of interest when the oscillations of the lake are more fully described.

Passing to other localities where white marl has been observed, we find that in sheltered ravines on the sides of the basaltic buttes overlooking the southern shore of the South Carson Lake there are fine, mealy deposits of this nature, 20 or 30 feet thick, and some distances below the highest of the Lahontan terraces, which contain gasteropod shells in abundance. Similar beds were also observed about 2 miles north of Allen's Springs, in the bottom of the ancient channel leading to the Carson Desert. The exposure is here imperfect, and as the beds are but little elevated above the general desert-surface it is with doubt that they are referred to the same period in the history of the lake as the similar deposits observed at higher levels. White marl may also be seen at a number of indefinite exposures at a uniform horizon, some distance below the Lahontan beach, along the steep bluffs which border the Carson Desert on the south. In Alkali Valley, 2 or 3 miles west of Sand Springs, similar marls filled with gasteropod shells occur in a group of embankments that project into the valley. Another locality of the same nature was observed on the west side of Humboldt Lake at an elevation of four hundred feet above the lake surface.

In the Truckee Cañon, about a mile below the Truckee Narrows, there are beds of pure, white, chalky marl not less than 50 feet in thickness, that are grouped about a butte of volcanic rock which was formerly completely buried beneath Lahontan sediments, but is now exposed by the erosion of the river. These beds are in part overlain by Lahontan deposits, but the exposure is obscure and the relation of the marls to the associated clays

not easily determined; no fossils were found, and it is not impossible that the marls are of much older date than the associated Quaternary beds; possibly they are of Tertiary age.

The best localities of all for observing the deposits we are considering are about Pyramid Lake. In this basin they frequently appear as a conspicuous white band along the borders of the valley at an elevation of 320 feet above the 1882 level of the lake, and form a well defined built-terrace which we have named the "White Terrace." Measurements with an engineer's level, as well as many observations with an aneroid barometer and hand level, show this terrace to have a nearly uniform height and to be coincident in elevation with the water-line which marks the upper limit of the dendritic tufa. About the Marble Buttes, and at many points along the steep western shore of Pyramid Lake, the White Terrace is well exposed in sheltered ravines, which were coves and bays when the waters occupying the valley stood 320 feet higher than at present, but it is wanting on projecting spurs. Northward of Mullen's Gap the terrace becomes more continuous, and when cut by arroyos exhibits the sequence represented in the following section :

FIG. 24.—Section of White Terrace, west side of Pyramid Lake, Nevada.

In some instances the outer border of the terrace has been removed so that the steep lakeward dip of the strata is not always observable. At a number of localities the terrace is from 200 to 400 yards broad, with a plane or slightly concave upper surface which usually slopes gently lakeward; the outer scarp is steep and at times 30 or 40 feet high, but the deposit diminishes rapidly in thickness towards the shoreward margin. The marly beds are usually underlain by alluvium, as shown in the figure, and are

overplaced along the shoreward margin by similar material that has been swept down from the slopes above. Sometimes the marls are deeply eroded and present typical "bad land" topography in miniature.

The White Terrace may be seen at a number of places about the northern end of Pyramid Lake, and in the pass leading to Honey Lake Valley. At the southern end of Smoke Creek Desert it was again observed, with its normal elevation of 320 feet above Pyramid Lake. Further northward, it occurs at a number of localities on the steep borders of the Black Rock Desert. From the numerous exposures observed it is evident that this terrace occurs all about the deeper portions of Lake Lahontan, and may be considered as co-extensive with the dendritic terrace with which it coincides in elevation. The occurrence of the marl as a shore deposit is independent of the character of the rock against which it rests; it occurs with equal purity on alluvial slopes and on shores of limestone, basalt, rhyolite, etc. It is found in abundance about isolated buttes that formed small islands in the former lake, as well as along the shores of the mainland, and is therefore evidently not a product of erosion. Occasionally, however, the marl is mingled with sand and pebbles, and when it takes the form of a free bar the proximal end will be found to contain more foreign material than the distal extremity, thus indicating the assorting power of the currents that transported the material.

At all the numerous localities where the White Terrace is exposed it is composed of fine, incoherent, chalky marl, which is often richly charged with the shells of fresh-water mollusks. In places the deposit is 40 or 50 feet thick, and homogeneous throughout. An analysis of a typical sample collected on the western border of Pyramid Lake Valley, as reported by Dr. T. M. Chatard, is given below, and shows that the material is essentially an impure calcium carbonate containing a high percentage of silica:

Water (H ₂ O)	3.32
Calcium carbonate (CaCO ₃)	64.82
Silica (SiO ₂)	22.00
Alumina (Al ₂ O ₃)	5.14
Iron (Fe ₂ O ₃)	2.04
Lime (CaO)	0.93
Magnesia (MgO)	1.89
	100.14

When examined microscopically the marl reveals a great quantity of crystallized and amorphous calcium carbonate, very similar in appearance to the same substance obtained by precipitation in the laboratory, together with other bodies which appear more clearly when the material is treated with diluted acid. On examining the residue insoluble in acids under the microscope, is found to contain many diatoms, especially in the finer and more flocculent portion of the sediment; the coarser portion, which subsides most quickly, also contains diatoms, but is mainly composed of crystalline grains and many glassy flakes similar to those composing the volcanic dust described on page 146. The chemical and microscopical examinations render it evident that the material in question is mainly a chemical precipitate, but is also, in part, of mechanical and organic origin.

It seems probable that the calcium carbonate forming the principal portion of the marl was precipitated from the waters of Lake Lahontan in a microcrystalline and amorphous form at about the time the dendritic tufa was being accumulated; and became mingled with the siliceous exuviae of the microscopic organisms that lived in abundance in the lake waters; it also received some contributions of volcanic and æolian dust, but, in the main, was free from the products of ordinary stream erosion. The deposit thus formed, when near the shore, was assorted and rearranged by currents so as to form the terrace and embankments we now find. In the deeper portions of the lake the lime precipitated from the waters was mingled with clay and sand and now appears as marly-clay. The abundant precipitation near the shore may also have been due, in part, to the greater abundance of nuclei which tended by their presence to induce crystallization.

ÆOLIAN SANDS.

The accumulations to be described under this head consist mainly of sand that has been blown about by the wind and finally deposited in banks or dunes which sometimes cover large areas.

The first acquaintance the explorer in the Great Basin usually makes with the material forming these deposits is when it is in motion and fills the air with clouds of dust, sand, and gravel, which are blinding and irritating, especially on account of the alkaline particles which saturate the

been blown inland by the prevailing westerly winds. It seems more probable, however, that they owe their origin to the subaërial disintegration of the granites of the Sierra Nevada.

SECTION 4.—ANCIENT STREAM CHANNELS.

When the waters of Lake Lahontan subsided during inter- and post-Lahontan periods its basin became divided into separate water bodies or independent lakes, some of which were connected by streams that overflowed from one to another. The channels eroded by these streams are interesting not only as examples of erosion, but because they contribute to the interpretation of the history of the former lake. When a large inclosed lake is reduced so far by evaporation that the inequalities of its bottom divide it into independent areas, it is evident that this fact in itself is a record of an important climatic change; when the ridges or embankments that divide a lake in this manner are cut by channels of overflow, it is evident that they may furnish some index of the length of the period of desiccation or perhaps of the date at which it occurred. The multiplication of hydrographic basins by desiccation is illustrated by the present condition of the Lahontan region, as shown on Plate XXIX. The ancient lake basin is now divided into six independent drainage areas.

Old channels now abandoned and dry occur in the Lahontan basin, between the larger areas of the former lake and the neighboring valleys that once formed bays along its shore. The Carson Desert is united with the desert valley south of Allen's Springs by a deeply eroded channel of this nature, which appears to have been cut by a stream flowing northward; a moderate rise of the waters of the Carson Desert would flood this pass and reconvert it into a strait. This channel is about 5 miles long, and has precipitous walls composed of lacustral sediments, which are lined with the form of tufa we have called dendritic, while in the bottom of the pass there are crags of thinolitic tufa; from these records we learn that the channel was excavated previous to the rise of the lake during which tufa deposits were formed. As the sequel will show, these tufas were deposited during that

be driven inland by the prevailing westerly winds. It seems more probable, however, that they owe their origin to the subaërial disintegration of the rocks of the Sierra Nevada.

SECTION 4.—ANCIENT STREAM CHANNELS.

When the waters of Lake Lahontan subsided during inter- and post-Lahontan periods its basin became divided into separate water bodies or independent lakes, some of which were connected by streams that overflowed from one to another. The channels eroded by these streams are interesting not only as examples of erosion, but because they contribute to the interpretation of the history of the former lake. When a large inclosed lake is reduced so far by evaporation that the inequalities of its bottom divide it into independent areas, it is evident that this fact in itself is a record of an important climatic change; when the ridges or embankments that divide a lake in this manner are cut by channels of overflow, it is evident that they may furnish some index of the length of the period of desiccation or perhaps of the date at which it occurred. The multiplication of hydrographic basins by desiccation is illustrated by the present condition of the Lahontan region, as shown on Plate XXIX. The ancient lake basin is now divided into six independent drainage areas.

Old channels now abandoned and dry occur in the Lahontan basin, between the larger areas of the former lake and the neighboring valleys that once formed bays along its shore. The Carson Desert is united with the desert valley south of Allen's Springs by a deeply eroded channel of this nature, which appears to have been cut by a stream flowing northward; a moderate rise of the waters of the Carson Desert would flood this pass and reconvert it into a strait. This channel is about 5 miles long, and has precipitous walls composed of lacustral sediments, which are lined with the form of tufa we have called dendritic, while in the bottom of the pass there are crags of thinolitic tufa; from these records we learn that the channel was excavated previous to the rise of the lake during which tufa deposits were formed. As the sequel will show, these tufas were deposited during that

Scale: 29 miles = 1 inch

portion of Lahontan history that witnessed the accumulation of the upper clays; and since the walls of the channel are composed of lacustral sediments, the inference is drawn that it was excavated during an inter-Lahontan period of desiccation. It will appear, as we progress with our history, that this is but one of a number of independent lines of proof which show that Lake Lahontan had two high-water stages, separated by a time when it was greatly lowered by evaporation, and perhaps reached absolute dryness.

The ancient channels, now dry and abandoned, similar to the one connecting Carson Desert and the desert basin south of it, occur at the northern end of Pyramid Lake Valley; one of these leads to Honey Lake Valley and the other to Smoke Creek Desert. The former, known as Astor Pass, was never deeply excavated, showing that the valley in which Honey Lake is situated must have been an independent water-body during a large part of the Quaternary. The second, however, is a pass, now partially obstructed by gravel embankments, which must have been a narrow strait during the greater part of the Lahontan period. The bottom of this pass is on a level with the thinolite terrace in Pyramid Lake Valley, as shown by aneroid measurements, and is thought to have regulated the water in that valley in such a manner as to bring it frequently to the same level. This would be accomplished by allowing it to escape, at a certain horizon, on to the Smoke Creek Desert. It may be that this is the reason for the great strength of the thinolite terrace about Pyramid Lake. Another channel of a similar character, now known as the Ragtown Pass, connects the Carson Desert with the desert valley in which the Eagle Salt Works are situated. All these channels were in existence before the deposition of dendritic tufa, but the proof that they were excavated in lacustral clays is less definite. It is probable that some of them were occupied by streams before the first rise of the ancient lake. In some instances they have become partially re-excavated during the present period of desiccation, but usually they are still occupied by the upper clays.

Other channels of this character have been examined in the Lahontan basin, but their features are not so clearly defined as in the examples described above, and their bearing on the history of the former lake is consequently less definite.

SECTION 5.—ILLUSTRATIONS OF GEOLOGICAL STRUCTURE.

It is customary to consult the older and usually the more thoroughly consolidated stratified rocks for illustration of geological structure, but as such features are in many cases the records of the manner in which the beds were deposited, it is evident that they should occur in the newest as well as the oldest formations. It is well known that the history of the earth is a continuous record, however fragmentary it may seem at the present day, and that the processes of nature have been the same throughout the geological ages. Nowhere are these axioms more thoroughly sustained than in the recently desiccated lake basins of the Far West. As the gravels and finer sediments deposited in Lake Lahontan afford many instructive records of the circumstances under which they were accumulated, we have prepared the following brief summary of observations relating to geologic structure due to deposition, erosion, etc., believing that it will assist in interpreting similar phenomena when observed in older rocks, where they are frequently obscured by metamorphism and other changes.

STRATIFICATION AND LAMINATION.

The sediments forming the upper and lower portions of the Lahontan section consist of fine, homogeneous, evenly-stratified marly-clays, which show a distinct lamination parallel with the planes of bedding. Attention is called to the lamination of these deposits in connection with other features due to deposition, as it has manifestly resulted from the slow accumulation of fine sediments in thin layers, and does not owe its existence to pressure, as is the case in many older rocks. This is evident since both the upper and lower clays are alike laminated, while the higher members of the series at least have never been subjected to the pressure of superimposed deposits.

CURRENT BEDDING.

The gravels separating the upper and lower Lahontan clays are characterized by extreme irregularity, and afford many illustrations of structure due to deposition. They were deposited in the shallow waters and were much agitated by waves and currents, and among other features present

typical examples of "current bedding," sometimes called "cross-bedding" and "false-bedding," as is abundantly illustrated in the walls of the Humboldt, Truckee, and Walker cañons. The beautiful curves presented by these irregular beds when seen in section are represented with much accuracy in the detailed sections illustrating the exposures observed. From the thousands of examples examined in various portions of the basin, those presented on Plates XXIII, XXIV, XXV, and XXVII, have been selected as types of this phenomenon. Not only is this structure remarkable for the grace and elegance of the curves produced, but each sweeping line and each curving stratum has an individual structure and varies through all degrees of fineness, and through very many shades and tints, which serve to distinguish it from adjacent deposits. The accuracy of the illustrations to which we have directed attention renders farther description of the forms presented by current-bedded gravels when seen in section unnecessary.

Examples of what may be properly designated as "drift bedding" are abundant, especially in the walls of the Truckee Cañon, which furnish fine examples of the oblique stratification produced when currents sweep sand and gravel along the bottom until the edge of a scarp is reached and then deposit them in inclined layers. Under favorable circumstances this action may continue until a stratum is formed that is obliquely stratified from top to bottom, perhaps several feet in thickness, and of wide extent, as illustrated in the central portion of the section exposed in the Truckee Cañon.

The deposition of current-borne *débris* in inclined strata sometimes takes place on a grand scale, as is illustrated by the section of the gravel deposits at the southern end of Humboldt Lake, shown in Fig. 17, and again by Fig. 20, which represents a section of a similar structure at the southern end of Winnemucca Lake. In the cañon of the Walker River, evenly-bedded strata inclined at an angle of from 15° to 20° are exposed in a section that is fully 200 feet high, as represented on Plate XXVIII. In all these examples, and in many others that have been studied, the current-borne gravels composing the strata were deposited in the inclined position they now occupy, and do not owe their inclination to a movement of the beds subsequent to their deposition. Stratified beds deposited at an

incline are usually composed of water-worn gravel, but instances are not rare in the Lahontan basin of fine clays and marls that were formed in even layers inclined at an angle of from 10 to 20 degrees.

CONTORTED STRATA.

The folded and contorted appearance presented by many sedimentary beds may originate in two ways; either they were deposited in a horizontal position and subsequently disturbed, or they were laid down in agitated waters in the contorted forms we now find. The Lahontan sediments afford illustrations of each of these modes of origin.

Examples of contortion and deformation in the lower lacustral clays, obviously due to motion produced by the weight of the superimposed deposits, were observed at many localities. In the Truckee Cañon, disturbances of this nature occur, as shown in the lower portion of the illustration forming Plate XXV. At the left of the section the stratum of marly clay has been broken in an irregular manner and one part thrust over the other; at the right, in the same section, the strata are crumpled and folded in such a manner as to form anticlinals and synclinals in miniature. Other illustrations of similar disturbances may be seen in the section exposed along the Humboldt, Truckee, and Walker rivers. At the top of the section shown on Plate XXV, but weathered back so as not to appear in the drawing, there is a deposit of fine yellowish sand in contorted strata resting on the upper clays. This deposit contains crystals and rosette-like masses of selenite, and is evidently water-laid—not æolian as perhaps might be fancied—and from its position at the top of the section could never have been subjected to pressure or mechanical disturbance. The contortions and foldings of the thin sheets of sand composing this deposit are rendered especially distinct, when seen in section, by the presence of iron-stained lines and bands, which indicate a character of contortion that can only be explained by assuming that the beds were deposited in the irregular forms they now present. Similar contorted beds were observed in the Quaternary strata of the Mono Lake basin, California, in a bed of sand and pebbles 18

inches thick, inclosed between horizontal, evenly-bedded, ripple-marked clays and sand. In this instance the iron-stained lines marking the edges of contorted sheets, form a most intricate pattern when seen in section, and inclose pockets and cells sometimes four or five inches in diameter, that are without openings and packed full of gravel and stones; in some instances the pebbles thus enclosed are an inch or more in diameter and are all well water-worn. The presence of these cells filled with material of a different nature from the contorted sheets of sand, while the strata above and below the contorted layer are of fine sand and clay in even horizontal beds which show no crumpling, is evidently proof that the disturbance causing the irregularities of the deposit took place during the deposition of the strata and cannot be referred to subsequent mechanical movement. The conditions under which these contorted sands were accumulated are difficult to determine, but in some instances deposition seems to have taken place in shallow lakes that were greatly disturbed by winds and currents. The hypothesis which attributes the contortion of superficial strata to the action of advancing glaciers and grounded icebergs is not here admissible, as the relation of the lakes and glaciers is well known. The action of a moving ice sheet, formed by the freezing of a lake, might perhaps under certain conditions disturb the sediments beneath, and might even transport pebbles from the shore and drop them in offshore deposits; thus forming strata analogous to the exposure observed near Mono Lake. It is impossible, however, to account completely for all the phenomena observed by any of the hypotheses that have been suggested.

ARCHES OF DEPOSITION.

The finest example of an arch of deposition that has been observed in the Lahontan sediments is represented in the section forming Plate XXV, and has already been noticed in describing the exposure to be seen along the Truckee River. This, with scarcely any doubt, is a section of a gravel bar, the top of which was removed previous to the deposition of the superimposed gravels. Similar arches, but less complete, may be seen in other portions of the Truckee section, and occur in greater or less perfection wherever a cross-section of a current-formed embankment or bar is

exposed. That the arch represented on Plate XXV is the result of deposition and not of mechanical disturbance is clearly shown by the horizontal stratification of the material above and below it.

UNCONFORMABILITY BY EROSION AND DEPOSITION.

Wherever the junction of the medial gravels with the lower or upper clays is exposed, one is nearly always sure to find evidence of unconformability, resulting usually from the erosion of the older strata. Examples of this phenomenon are shown in nearly all the accompanying illustrations which include the junctions in question. On Plate XXVII, the cross-stratification of the gravels filling eroded hollows in the lower clays is admirably shown by Figs. A, C, and D. On Plate XXIII, Fig. G illustrates the manner in which the strata filling eroded hollows are sometimes thickened; while Fig. J shows a thinning of similar beds when deposited over a protuberance of the bottom on which they were laid down. Figure K, of the same plate, furnishes an example of current-bedded gravels covering the eroded surface of the lower clays, while a second line of unconformity, also resulting from erosion, parts the gravels themselves. Sometimes the variations due to erosion and deposition are complicated by the effects of subsequent lateral movement, as appears to have taken place in D, Plate XXIII. Unconformability by deposition alone, where erosion has but little effect, is shown in Fig. B, Plate XXVIII, which illustrates the contact of horizontal lacustral beds resting upon gravels that were deposited in inclined strata. Other examples of a similar character may be found in many of the accompanying illustrations.

JOINTING.

The marly clays forming the upper and lower members of the Lahontan series usually break into prismatic and cubical blocks on weathering; the vertical faces of the blocks are determined by joint planes, and the horizontal by planes of lamination. In many localities a more pronounced jointing occurs, forming two approximately vertical systems that are nearly at right angles to each other. Judging from the number of instances observed, at widely separated localities, the joints in question may be

traced through the entire series of lacustrine beds. The occurrence of two distinct and well-marked systems of joints in a bed of marly clay 6 feet thick, lying between unconsolidated gravels, has been noticed on page 132. This may be taken for an example of what may be seen at numerous localities. The most striking exhibition of jointing that we have observed in the Lahontan strata occurs in the upper clays on the west side of the Humboldt River, near Saint Mary's. An arroyo has there exposed a vertical cliff 25 feet high, of homogeneous, marly clay that is cut from top to bottom by joints which divide the material into small pentagonal prisms that bear a superficial resemblance to basaltic columns. Specimens of these prisms may be collected that are 2 or 3 feet in length and not over 3 or 4 inches in diameter, with sharply-defined edges; in some instances the diameter of the columns is much less than here indicated, the prismatic form being still well preserved. The jointing of the Lahontan sediments is of the same nature as the similar phenomena observed in the Bonneville basin, the origin of which has been the subject of some discussion.⁵¹

FAULTS.

Two systems of faults have affected the sediments of Lake Lahontan; the first is of wide extent and due to a recent movement along the ancient lines of displacement which gave origin to the structural features of the region; the second is of local origin, and seems to be entirely independent of orographic disturbances. Displacements of the first class will be described in a future chapter devoted to the description of post-Lahontan orographic movements. The local faults in which we are interested at present are common in the soft, unconsolidated sediments of the ancient lake, but even in the most typical instances their displacement does not exceed a few feet, and, as indicated by several observations, they appear to have small vertical range, *i. e.*, their throw diminishes and finally disappears when

traced downwards. Their hade usually approaches the perpendicular, and, as is common with the displacements in older rocks, slopes to the downthrow. In the instance represented below, however, the hade is reversed; this example occurs in unconsolidated gravels and clays of the Lahontan series at Mullen's Gap, on the western border of Pyramid Lake.

The upward bend of the strata on the heaved side of this fault may perhaps be accounted for by assuming that the displacement has undergone double movement. During the first, the block to the left of the plane of fracture, as it appears in the figure, was the thrown block; its downward movement caused the ends of the strata of which it is composed to bend upwards, as is common in similar displacements in older rocks; afterwards the movement was reversed, and what was previously the thrown side was upraised beyond its former position. The faulting took place in this instance previous to the deposition of the cross-stratified gravels represented in the diagram above the line of unconformability, as is proven by the fact that the plane of fracture does not extend through them. The interval between the disturbance causing the fault and the deposition of the superimposed beds was short, as is evident from the absence of erosion along the surface of unconformability.

Another illustration of the minor displacements that occur in the Lahontan sediments is given on Plate XXIII, Fig. A, which is remarkable

for the narrowness of the block cut out by the double dislocation; this double fault is one of a pair, as is shown in the following figure, which is drawn to the same vertical and horizontal scale, and represents with considerable accuracy the exposure observed in the cañon wall.

FIG. 26.—Faults in lacustral clays, Humboldt Cañon, Nevada.

This section includes the upper portion of the medial gravels, the upper clays, and the subaërial accumulations forming the surface of the desert.

In the walls of the Walker River Cañon, between Mason Valley and Walker Lake, there are many examples of faults which shear the lacustral deposits of the Lahontan series; two illustrations of the displacements there observed are given in Figs. A and B, Plate XXVIII. In the former, the actual fault is concealed by an alluvial slope, but the dip of the strata proves that it was formed previous to the deposition of the upper clays and probably before the medial gravels were accumulated. In the latter instance (Fig. B) the faulting occurred after the last rise of the ancient lake, and affected both the medial gravels and the upper clays. The inclination of the strata in the lower portion of this section is mainly due to their having been deposited in an inclined position. In this instance, as is usually the case in the faults we are considering, the general inclination of the beds due to deposition is but little disturbed. On Plate XVII, Fig. E, a number of faults belonging to the class we are considering are represented, which cut the stratified lapilli composing the ancient craters now occupied by the Soda Lakes near Ragtown, Nevada.

The faults noticed in the preceding paragraphs can only be studied to advantage when fresh sections of the Lahontan beds are exposed, and in

no instance is their presence indicated by a scarp crossing the surface of the deserts.

The existence of faults shearing unconsolidated strata of sand and clay can scarcely be accounted for by the hypothesis of tangential strain, as has so often been done in the case of displacements in older and more consolidated rocks, as these beds are still horizontal and have not been subjected to the pressure of superimposed accumulations. The strata on either side of the planes of fracture are undisturbed. As the displacements are local and unconnected with any general orographic movements and in some instances die out as we trace them downwards, it seems safe to conclude that they have resulted from some change in the strata themselves, as is perhaps the case also with the joints occurring in the same beds. The Lahontan sediments were water-laid and are now desiccated. It may be that the contraction produced on drying will be found a sufficient explanation of the faulting and jointing that has been observed. The drying of heterogeneous stratified beds must result in unequal contraction of the various members of the series, at the same time that the unequal desiccation of various portions of the basin would complicate the resultant stress. In the Lahontan basin changes of this nature have taken place and have been accomplished by jointing and faulting. That these facts stand in the relation of cause and effect, however, is but a provisional hypothesis.

STRUCTURE OF TERRACES AND EMBANKMENTS.

While describing the formation of terraces and sea-cliffs it was shown that the loose material occurring on lake shores is sometimes swept along by currents and deposited so as to form a horizontal shelf bounded by a steep scarp on the lakeward slope. Owing to the mode of its formation, the structure of such gravel-built terrace is necessarily irregular, but as a whole is characterized by oblique stratification, especially on its lakeward margin, and abounds in examples of current bedding. Its material varies from accumulations of boulders, sometimes two or three feet in diameter, through all degrees of comminution to the finest of silt and marl, and is usually of a heterogeneous character, dependent on the nature of the rock

forming the lake shores. The general structural features of a built terrace are shown in the section inserted on page 151.

When a shore current bearing *débris* enters deep water, as illustrated by a simple instance on page 94, it commences the formation of an embankment, which is increased by the addition of gravel, sand, etc., in inclined strata at its end and along its sides. A cross-section of a regularly formed embankment should show a series of more or less perfect arches of deposition.

CONGLOMERATES AND BRECCIAS.

In many of the bars and terraces described in this report the gravel of which they are composed is firmly cemented by calcium carbonate into a compact conglomerate. A similar action has taken place in some of the alluvial slopes once submerged beneath the waters of the ancient lake, which at times has resulted in the formation of typical breccias. On the west shore of Pyramid Lake, near Mullen's Gap, the immediate lake margin is formed of sand and pebbles that have been consolidated into a firm conglomerate by the deposition of calcium carbonate. Similar beds were observed on Anaho Island and about the Needles at the northern end of the lake. In all these instances the conglomerate slopes lakewards at a low angle, sometimes amounting to ten degrees. This in all cases is evidently of a very recent date and in places is still being deposited. Although the youngest of the rock series, yet it is sufficiently consolidated to acquire a polish from the constant attrition of the sand that is washed over it and compact enough to be used for the ruder kinds of masonry. Similar conglomerates which appear also to be still in process of formation were observed on the shores of Walker, Winnemucca, and Mono lakes.

Breccias cemented by calcium carbonate are formed in alluvial slopes of the Great Basin above the limits of the Quaternary lakes. These deposits are usually less firm than the lacustral conglomerates, and frequently differ in the fact that the cementing material is accumulated most abundantly on the lower surfaces of the stones forming the deposit. The precipitation of calcic carbonate in the interstices of alluvial slopes apparently results from the evaporation of the percolating waters and the conse-

quent deposition of the salts held in solution, which act as a cement and sometimes change a loose *débris* heap to a compact conglomerate or breccia. Subaërial deposits of this nature are common throughout the arid region of the Far West.

OOBITIC SAND.

The presence of oolitic sand on the shore of Pyramid Lake has already been referred to in connection with the general description of the lake. This material is evidently now forming, and in places has been cemented into a compact oolite by the deposition of a paste of calcium carbonate between the grains, and forms irregular layers several inches in thickness that slope lakewards at a low angle. The oolitic grains composing the beach sands are frequently a quarter of an inch or more in diameter, and would, perhaps, more properly be designated as pisolite. When examined in thin sections under the microscope each grain is seen to be made up of a large number of concentric layers of calcium carbonate surrounding a particle of sand or other foreign body which furnished the original nucleus. The spherical form of the grains and the uniform thickness of the concentric layers evidently indicates that the kernels were in motion during the slow deposition of the concentric shells of which they are principally composed. Oolitic sands occur also at a number of localities near the base of the dendritic tufa, thus indicating that the conditions necessary for the formation of a deposit of this nature were then prevalent throughout the entire area covered by Lake Lahontan. That the chemical conditions favoring the formation of oolitic sands vary through wide limits is shown by the fact that they are now forming both in Pyramid Lake and in Great Salt Lake. The former contains less than half of one per cent. of solids in solution, while the latter has varied from over twenty-two to about thirteen per cent. during the past twenty years.⁵²

SURFACE MARKINGS.

The surfaces of lacustrine deposits when laid bare and subject to desiccation become covered with a net-work of shrinkage cracks and are not infrequently impressed with the foot-prints of animals; sometimes, too, the

⁵² See table of analyses at C, page 180.

muddy surfaces are pitted by falling rain-drops or covered with ripple marks. When the waters again cover such an area, all these records may be concealed beneath superimposed strata and thus preserved for an indefinite time. They are, in fact, as well suited to become fossilized as the records of a similar nature so common among the Triassic rocks of the Atlantic slope. The markings inscribed on the surfaces of lake beds are identical with many records that are made on the sands and mud along the ocean's shore, and if fossilized, would in themselves give no indication of the character of the water-body on the borders of which they were formed.

COLOR OF LACUSTRAL SEDIMENTS.

From the study of the Triassic, Old Red Sandstone, and other formations of Europe,⁵³ Professor Ramsay was led to the conclusion that sediments deposited in inland waters were usually iron-stained. The reverse of this conclusion would probably have been reached had lake deposits been first studied in the Great Basin, as all the lacustral beds in that region are light colored and seldom show more than a trace of the presence of iron. Some of the inclined beds in the Walker River section have a pink tinge, due to the presence of iron, while some of the contorted sands we have described have a yellowish color. These features, however, are inconspicuous and do not affect the statement that the sediment in question are a total exception to the rule referred to above.

RÉSUMÉ OF PHYSICAL HISTORY.

To arrive at a satisfactory understanding of the physical history of Lake Lahontan, as recorded in terraces, gravel embankments, deltas, sedimentary deposits, river channels, etc., it is necessary to combine our observations of these phenomena with the records of the chemical history of the lake as furnished by tufa deposits and desiccation products, with reference, also, to the present physiography of the basin. Before considering the

⁵³ "On the Physical Relations of the New Red Marls, etc.," Quarterly Journal of the Geological Society of London, Vol. XXVII, p. 189. Also: "On the Red Rocks of England of older date than the Trias." *ibid.*, p. 241.

chemical questions connected with the present study, it may be well to see how far our observations relating to the physical history of Lake Lahontan can be correlated.

The presence of vast alluvial slopes of pre-Lahontan date, on which the water-lines of the old lake are traced, leads to the conclusion that the climate of the region was arid for a long time previous to the first filling of the basin of which we have any definite record, viz., the earlier high-water stage of Lake Lahontan. The discussion of this question, however, falls more properly in the chapter devoted to the consideration of Quaternary climate. We assume, for the present, that a change from arid to more humid conditions caused the Lahontan basin to be filled to the level of the lithoid terrace, and to remain at that horizon long enough to enable its waves to excavate a broad shelf in the rocky shores. The terraces above the lithoid are of subsequent date, as is shown by the section of the higher water-lines given on page 103; as there indicated the lithoid terrace is frequently a shelf cut in the rock, on which rest the built terraces that define the Lahontan beach. At other localities the lithoid terrace is represented by gravel embankments that are overlapped by much smaller structures of the same character at the level of the highest water-line. Cumulative evidence of this nature shows that the lake lingered at the horizon of the lithoid terrace for a much longer time than at the higher levels. The lithoid terrace and the Lahontan beach thus record two independent high-water stages. The fluctuations of the lake during the interval between the formation of these water-lines cannot be determined from the physical records alone, but are not difficult to sketch, at least in outline, when the tufas that were precipitated from the waters of the lake are considered. Turning to the stratified beds accumulated in the lake basin, we find two series of fine lacustral sediments separated by a widely-spread sheet of water-worn and current-bedded sands and gravels which were evidently deposited in shallow water. This record of two lake periods, with a time intervening when the basin was at least as nearly desiccated as at the present day, is perhaps the most positive of all the chapters of Lahontan history. That the formation of these two deposits of lake sediments may be correlated in time with the formation of the

lithoid terrace and the Lahontan beach remains to be considered in connection with the chemical study of the lake.

The great number of water-lines scoring the interior of the Lahontan basin shows that the main changes in the history of the lake were accompanied by many minor fluctuations. The absence of an outlet renders it evident that the minor oscillations as well as the more permanent horizons recorded by the ancient terraces were due to climatic changes, the nature of which will be considered in a future chapter.

From this brief *résumé* it will be seen that the facts in the physical history of the lake can be correlated but imperfectly, yet give evidence that they have a definite sequence and are in fact fragments of a connected history. In the chemical studies which follow we shall be able to present some of the pages that are here missing and sketch the history of Lake Lahontan with greater completeness.

CHAPTER V.

CHEMICAL HISTORY OF LAKE LAHONTAN.

SECTION 1.—GENERAL CHEMISTRY OF NATURAL WATERS.

The investigation of the chemical history of a lake properly begins with the study of the meteoric waters that supply its hydrographic basin. Lakes are filled to some extent by direct precipitation from the atmosphere, but mainly by tributary streams and springs; it is evident, therefore, that we should look to these channels for the sources of the dissolved mineral matter which all lakes contain. It is true that lakes are sometimes formed by the isolation of portions of sea water, or may occur over beds of salt or other easily soluble rocks; but such cases are exceptional and their abnormal character easily accounted for.

RIVER WATER.

Even rain water and freshly fallen snow are not absolutely pure, but usually contain some organic and saline matter, together with carbonic acid, nitrogen, ammonia, chlorine, etc., which have been dissolved during their passage through the atmosphere. In an arid region, like the Great Basin, where the soil is commonly alkaline, and its surface frequently coated over large areas with saline efflorescences, the dust that is carried high in the air by the winds is richly charged with soluble salts which are dissolved by the falling rain, thus rendering it less pure than the meteoric waters of more humid regions. Rain water on reaching the earth dissolves the more soluble minerals with which it comes in contact, and becoming charged with carbon dioxide (carbonic acid), together with humic and crenic acids, and other organic products, it forms such an energetic solvent

that but few substances can entirely resist its action. By the time the surface waters have united to form rills, they contain sufficient mineral and organic matter to have a complex chemical composition. On through their history, as they form brooks, creeks, and rivers, and finally merge with the ocean or some inland sea, they are constantly increasing their sum total of dissolved mineral matter, and are at the same time concentrated by evaporation. The waters of a river when filtered from all suspended matter and evaporated to dryness leave a solid residue which is the principal portion (the more volatile substances escaping) of the foreign matter held in solution. These waters are fresh in the every-day use of the term, but in fact owe their pleasant taste and, to a great extent, their health-giving qualities, to the mineral substances held in solution. In the following table the analyses of the waters of a number of American rivers are given, for the purpose of indicating what salts are contributed to lakes in greatest abundance by their tributaries. The principal impurities in nearly every instance are calcium and carbonic acid, probably combined in the waters as calcium bicarbonate; sometimes, however, calcium sulphate is in excess of any other salt, as in the case of the Jordan River, Utah. Surface waters derive their chemical impurities mainly from the rocks over which they flow, and consequently vary in composition with the geological character of their hydrographic basins. When draining a granitic or volcanic area they are usually rich in potash and soda; when flowing over limestone they are frequently saturated with calcium carbonate. This is illustrated in the Far West by the streams entering the Bonneville and Lahontan basins. In the former they have their sources in the Wasatch Mountains where limestones occur, and are usually rich in calcium carbonate; potash is commonly absent, and soda, if present, is comparatively small in amount. In the Lahontan basin volcanic rocks predominate and the streams contain a higher percentage of potash and soda than is usual in a region underlain by sedimentary rocks.

By inspecting the table it will be seen, as stated above, that the most abundant of all the various substances carried in solution by the streams of this country is calcium carbonate. On averaging the amounts given in the tables we have 0.15044 part per thousand as the average of total solids,

and 0.056416 part per thousand as the average of the calcium carbonate contained in the waters of American rivers.

In a table of 48 analyses of European river waters given by Bischof,⁵⁴ the average of total solids is 0.2127, and the average of calcium carbonate 0.1139 part per thousand. From the analyses of 36 European river waters published by Roth,⁵⁵ including some of those tabulated by Bischof, we obtain 0.2033 part per thousand as the average of total solids; and 0.09598 parts per thousand as the average of calcium carbonate. In both American and European river waters, so far as can be determined from the data at hand, the average of total solids in solution is 0.1888, and the average of calcium carbonate 0.088765 part per thousand. These figures may be assumed to represent the average composition of normal rivers. It will be noticed that the average for calcium carbonate amounts to nearly one-half of that for total solids.

Knowing the volume of a stream and the percentage of mineral matter it holds in solution, we can ascertain the amount of dissolved matter that it contributes annually to the ocean or enclosed lake to which it is tributary. To one unfamiliar with such investigations the amount of solid matter thus annually transported in an invisible state from the land to the sea will appear truly astonishing.

The Thames at Kingston, as determined by the Royal Rivers Pollution Commission of Great Britain, has an average daily flow of 1,250,000,000 imperial gallons; the water contains of inorganic impurities 19, and of organic and volatile 1.68 grains per gallon. This is equivalent to 3,364,286 pounds, or 1,682 tons (of 2,000 pounds each), of inorganic matter daily; of this two-thirds, or 1,121 tons, are calcium carbonate, and 271 tons calcium sulphate.

The average flow of the Croton River, which supplies New York City, is 400,000,000 gallons daily, which contain 365,428 pounds; or nearly 183 tons of impurities; of these 47 tons are calcium carbonate.⁵⁶

⁵⁴ Chemical Geology, English edition, London, 1854, Vol. I, pp. 76 and 77.

⁵⁵ Chemical Geology, Berlin, 1879, Vol. I, pp. 456 and 457.

⁵⁶ Rep. American Public Health Association, Vol. I, p. 554.

The Hudson carries daily about 4,000 tons of matter in solution, of which more than 1,200 tons are calcium carbonate.⁵⁷

The Mississippi, as determined by Humphreys and Abbot,⁵⁸ discharges annually 21,300,000,000,000 cubic feet of water; from the analyses of the water at New Orleans, by Dr. W. J. Jones,⁵⁹ we learn that the total of solids carried annually by the river amounts to 112,832,171 tons; of which 50,158,161 tons are calcium carbonate. The amount of sediment transported by the river annually, as reported by Humphreys and Abbot, amounts to 887,500,000,000 pounds or 443,750,000 tons. The amount of solids, both in solution and suspension, carried annually to the sea, as determined from the data indicated above, is approximately 556,600,000 tons.

From the very incomplete observations on the discharge of the Humboldt River that have been made, we will assume 500 cubic feet, or, for convenience, 1,700 liters per second, as representing its average flow; each liter contains 0.3615 gram of solid matter in solution, which gives an annual transportation of about 18,000 tons; of this amount somewhat less than one-third, or approximately 5,000 tons, is calcium carbonate. In the same general manner we have estimated that the Carson, Truckee, and Walker rivers, collectively, transport annually about 10,000 tons of calcium carbonate. Not to overestimate we will assume that all the streams now entering the Lahontan basin carry annually 10,000 tons of calcium carbonate in solution. This estimate, although made on very imperfect data so far as the measurements of the streams are concerned, is certainly not too high, and enables one to understand whence the immense amount of calcium carbonate deposited in the form of tufa from the waters of Lake Lahontan was mainly derived.

SPRING WATER.

All the rain that falls does not find its way directly into the surface drainage, but a large portion sinks into the earth, and in many cases has a long underground passage before coming again to the light. During its subterranean course it takes an additional quantity of foreign matter into solution, and has its solvent power augmented by becoming more or less thoroughly charged with certain substances, such as carbon dioxide, which

⁵⁷ Report of the American Public Health Association, Vol. I, pp. 542-543.

⁵⁸ Report on the Mississippi River, p. 146.

⁵⁹ See Table of Analyses A.

act as solvents for many minerals otherwise not easily dissolved by water. Its solvent power is also augmented by the increase of temperature and pressure which it undergoes as it descends into the earth. The waters issuing as springs, frequently with a high temperature, are almost invariably found to have dissolved a great variety of mineral substances. In many instances the less soluble minerals occurring in spring waters are held in solution by the presence of carbon dioxide, or by high temperature or pressure. When such waters reach the surface they lose a large part of their dissolved gases, pressure is relieved, and they are rapidly cooled; the result is that much of the mineral matter they contain is deposited about the orifices through which they discharge. The substances most commonly precipitated under such conditions are calcium carbonate, oxides of iron and of manganese, calcium sulphate, and silica. Accumulations of these substances are frequently of great extent as may be amply illustrated in any of the hot-spring regions of the world. Only a portion of the dissolved matter brought to the surface by springs is thus deposited, however, and in many cases no immediate precipitation takes place. The waters, after losing their dissolved gases and becoming cooled, are usually much richer solutions than ordinary river waters, and, on joining the surface drainage, contribute large quantities of mineral matter to the neighboring streams. The solvent action of subterranean waters is frequently indicated by the porous and cellular character of certain rocks, as well as by the caves, frequently of vast size, that occur, especially in limestones.

The analyses of river waters in all ordinary instances must exhibit the combined result of the solvent action of both superficial and subterranean drainage. Springs frequently rise in the bottom of lakes or beneath the sea and thus contribute directly to the solutions with which rivers eventually mingle. In the case of inclosed lakes, the reaction of mineral waters, rising in dense saline solutions, is followed by interesting results, some of which will be considered in describing the tufa deposits of Lake Lahontan (*postea* page 221).

In illustration of the chemistry of natural waters we have compiled the following table (B) showing the composition of a few of the better known American springs and artesian wells; by comparison with Table A, the greater richness of subterranean waters over surface streams is at once apparent.

To illustrate still further the complex character of the mineral matter impregnating spring waters, and at the same time to indicate the changes in composition to which springs are subject, we give below two analyses of the waters of the same spring collected at different seasons. The sample obtained in October was secured after a rain that followed a long dry period, and probably owes its greater richness to saline efflorescences accumulated in the interstices of the rocks during the arid season and redissolved by the percolating rain water:

Springs of even more complex composition than the example given above might be presented if desired; in fact, subterranean waters are so

⁶⁰ American Chemist, 1884, p. 247.

nearly a universal solvent that all known mineral substances may be expected to occur in them. The recently discovered elements caesium and rubidium were first obtained by Bunsen in the mineral waters of Durkheim and Baden-Baden. It is to be hoped that a more minute examination of the springs of this country may lead to a similar increase in our knowledge of the constituents of the earth.

OCEAN WATERS.

Rivers with their loads of mineral matter in solution, derived both from surface and subterranean drainage, commonly flow into the ocean and are evaporated. The water rising in invisible vapor from the ocean's surface is again condensed, and much of it falls on the land as snow, rain, and hail, thus completing the cycle of changes. The mineral matter contributed to the ocean in solution, together with the substances dissolved directly from the bottom and sides of the oceanic basins, remains when the waters evaporate, and tends to increase the salinity of the sea. The precipitation of mineral matter from the waters of the ocean or its assimilation during the growth of plants and animals need not be considered at this time.

The results of chemical investigations, particularly those of Forchhammer and the chemists of the Challenger Expedition, have shown that the composition of the total solids dissolved in sea water from all portions of the ocean—excepting in the immediate vicinity of the land or near the mouths of large rivers—and for all depths, is remarkably constant. Disregarding the presence of the rarer substances, Dittmar gives the average composition of the solids dissolved in sea water as follows:⁶¹

Chloride of sodium	77.758
Chloride of magnesium	10.878
Sulphate of magnesia	4.737
Sulphate of lime	3.600
Sulphate of potash	2.465
Bromide of magnesium	0.217
Carbonate of lime	0.345
Total salts	100.000

A table giving the composition of the waters of the ocean at many localities, as determined by Professor Forchhammer,⁶² is introduced here for

⁶¹ The Voyage of H. M. S. Challenger, Physics and Chemistry, Vol. I, p. 204.

⁶² Philosophical Transactions of the Royal Society of London, Vol. CLV, p. 257.

comparison. It shows not only the average composition of the great bulk of the waters of the globe, but illustrates one of the most important stages in the history of natural waters.

Comparison of the means of all regions of the ocean (German Ocean, Kattegat, Baltic, Mediterranean, and Black Sea excepted).

[Expressed in parts per thousand.]

The South Polar Sea	15.748	1.834	0.498	1.731	28.565
Mean	18.999	2.258	0.556	2.096	34.404

It is evidently difficult, if not impossible, to obtain an accurate average of the composition of the ocean in all latitudes and at all depths, but a convenient approximation to the truth may be reached. The mean of 34.404 parts per thousand, given in the above table, is the result of a very large number of analyses, but includes regions of high northern and high southern latitude, where the sea must be somewhat affected by the melting of the great glaciers of these regions. It seems questionable, therefore, whether the mean given above is high enough to be taken as the average salinity of the ocean. Leaving out the analyses of the waters of Davis Strait and of the South Polar Seas, we obtain a general average of 35.101. From 134 analyses of waters from various parts of the open ocean, given in Roth's Chemical Geology, the general average of 34.957 parts per thousand was ob-

tained. Dittmar states⁶³ that of 160 analyses of sea water collected by the Challenger Expedition—

	Parts per thousand.
The lowest (from the southern part of the Indian Ocean, south of 66° S. lat.) contained	33.01
The greatest (from the middle of the North Atlantic, at about 23° N. lat.) contained	37.37
Average	35.19

In general, therefore, we may assume 3.5 per cent. as the average of total solids in sea water.

Besides chlorine, sulphuric acid, calcium, magnesium, and sodium, which make up $\frac{99}{100}$ of the total salts dissolved in the ocean, the investigations of Forchhammer and others have demonstrated the presence of 26 elements in solution, including bromine, iodine, fluorine, phosphorus, silicon, boron, silver, gold, copper, lead, zinc, cobalt, nickel, iron, manganese, aluminium, magnesium, strontium and barium. Many of these are present in extremely small quantities, and have only been detected by the aid of the spectroscope; while the presence of others has been determined by indirect analysis. As methods of research become more refined, and larger bodies of water are dealt with, it is to be presumed that more of the elements entering into the composition of the earth will be found dissolved in the waters of the ocean.

The following comparison of the composition of ocean and river waters is from Roth's Chemical Geology; the figures represent the mean of a large number of analyses, and give percentages of total solids:

Constituents.	Ocean water.	River water.	River water in regard to <i>a</i> , <i>b</i> , and <i>c</i> only.
<i>a</i> . Carbonates	0.21	60.1	80
<i>b</i> . Sulphates	10.34	9.9	13
<i>c</i> . Chlorides	89.45	5.2	7
<i>d</i> . Other matter		24.8	

This comparison indicates the result of a very complicated series of changes, dependent upon both biological and chemical reactions, which occur when river waters are subjected to the process of concentration that

⁶³ Voyage of H. M. S. Challenger, Chemistry and Physics, Vol. I, p. 201.

takes place in the ocean. As shown in the table, the carbonates mostly disappear, the sulphates increase slightly in percentage, while chlorides (mostly common salt) become the characteristic ingredient.

WATERS OF INLAND SEAS.

When rivers empty into a basin that has no outlet, their waters are evaporated in the same manner as in the ocean, and both their mechanical and chemical impurities are left as additions to the filling of the depression. Examples of such areas of interior drainage are well known in various parts of the world. In southern Asia, the Caspian, Aral, Dead Sea, and many other saline lakes, are the evaporating basins for independent hydrographic areas. The region of the Sahara in northern Africa is also shut off from the general oceanic circulation, but, owing to the high mean temperature there prevalent, the surface waters are mostly dissipated before lakes are formed. In South America another basin situated in the elevated tablelands of Peru and Bolivia is without drainage to the ocean. In North America there are small areas of a similar nature in Mexico; but the typical example on this continent is furnished by the Great Basin. Many of the lakes and seas situated in these various interior basins are without outlet, and are highly charged with saline matter. In some instances the percentages of the most abundant salts have reached their points of saturation and precipitation is taking place. The greater density of many inclosed lakes as compared with the ocean is due to the fact that concentration has been greatest in the restricted basins. The paucity of animal and plant life in most inclosed lakes has also some slight bearing on the problem.

To facilitate the comparison of the inclosed lakes of this country with similar waters elsewhere, we introduce a somewhat extended table of analyses of this class of lakes, embracing all within the United States the composition of which is known. This table includes the densest of natural waters and exhibits the extreme of a series that commenced with the nearly pure water formed by the condensation of atmospheric vapor.

When inclosed lakes were first studied it was quite naturally supposed that their usual saline condition could only be accounted for by assuming that they were isolated bodies of sea-water which had been shut off from

the general area by an elevation of the land. This hypothesis has been mostly abandoned, however, as one lake after another has been studied, until at the present time it is difficult, if not impossible, to point to a single lake, excepting perhaps the Caspian, having such a history. The origin of the salt lagoons found on so many shores is not here included, as their mode of formation is too obvious to admit of their being confounded with inland seas.

SUCCESSION OF SALTS DEPOSITED UPON EVAPORATION.

As already seen, inclosed lakes are constantly receiving additions from streams, springs, and rain, but do not overflow, their influx being counterbalanced by evaporation. This assures us that their percentage of saline matter must increase. This process continuing, a point is eventually reached when the waters are saturated with one or more of the more abundant salts and precipitation commences. Very simple experiments suffice to prove that waters of complex composition, when subject to slow evaporation, do not deposit their salts in a homogeneous mass, but in successive layers or strata of varying composition. As the order in which different salts are deposited varies with the composition of the waters, it is safe to say that in no two lakes is the succession of saline deposits formed on evaporation apt to be identical. Disregarding for the present the reactions of the various salts upon each other, it is evident that in the evaporation of natural brines the order in which the contained salts will be deposited is inversely as the order of their solubility. For example, a salt that requires a large amount of water for its solution, or, in other words, is sparingly soluble, will reach its point of saturation and commence to crystallize out, as evaporation progresses, previous to the deposition of a more soluble salt. To illustrate, it has been found that calcium carbonate requires about 10,000 times its weight of water, saturated with carbon dioxide, for its solution, while calcium chloride is very deliquescent and dissolves in nearly its own weight of water. In inclosed lakes to which streams are contributing these salts in equal quantities, and in which evaporation equals or exceeds the supply of fresh water, it is evident that the calcium carbonate would reach its point of saturation and commence to separate long before the waters had

become rich in calcium chloride. In fact, owing to its deliquescent nature, natural evaporation seldom proceeds far enough to cause the precipitation of the chloride. The early deposition of calcium carbonate when natural waters are evaporated is rendered the more certain for the reason that it is by far the most abundant salt found in surface waters.

The fact that various salts are deposited in a regular succession when mineral waters are evaporated, is of great service in securing certain ones in a pure state by the method of fractional crystallization. In evaporating the brines of Syracuse the precipitation of ferric oxide and calcium sulphate is first secured by moderate concentration; the water is then conducted to lower vats and evaporation is continued until the sodium chloride has mostly crystallized. The mother liquor, rich in magnesium and calcium, is then allowed to go to waste. In the Soda lakes near Ragtown, Nevada, sodium and calcium carbonates crystallize out as the mineral gaylussite, by the natural concentration of the waters; when evaporation is continued, the deposition of sodium sulphate and carbonate takes place previous to the crystallization of common salt.

On concentrating sea water it has been found that calcium carbonate is usually the first constituent to be precipitated. This salt is not always found when the waters of the ocean are analyzed, but may usually be detected when the sample examined is taken near shore. The quantity delivered to the ocean by the drainage of the land, seems to be almost exactly counterbalanced by its secretion in the tissues of animals and plants.

The separation of sodium sulphate, potassium chloride, and common salt from the mother liquor derived from the concentration of sea water, by alternate evaporation and cooling, is the principle of Balard's well-known process so largely used in the south of Europe. In Merel's modification of this process a low temperature is obtained artificially. When sea water is concentrated until its specific gravity is 1.24 (28°B.) it deposits about four-fifths of the common salt it originally contained; after adding 10 per cent. of fresh water to the mother liquor remaining, it is passed through a refrigerating machine and its temperature lowered to -18° C. The low temperature causes double decomposition to take place between the magnesium sulphate and the sodium chloride; sodium sulphate being deposited and the

magnesium chloride remaining in solution. The mother liquor still retains some common salt together with potassium chloride. The first of these is obtained by evaporating until the specific gravity of 1.33 (36°B.) is reached, which causes the deposition of nearly all the common salt; the remaining liquor is then conducted to shallow vats and allowed to cool; this causes the precipitation of the whole of the potassium as the double chloride of potassium and magnesium.⁶⁴

The succession of chemical precipitates formed when sea water is evaporated has been succinctly described by M. Dieulafait, in the *Popular Science Monthly*,⁶⁵ from which we quote the following:

First a very weak precipitation occurs of carbonate of lime with a trace of strontium, and of hydrated sesquioxide of iron, mingled with a slight proportion of manganese. The water then continues to evaporate, but remains perfectly limpid, without forming any other deposit than the one I have mentioned, till it has lost 80 per cent. of its original volume. It then begins to leave an abundant precipitate of perfectly crystallized sulphate of lime with two equivalents of water, or gypsum, identical in geometrical form and chemical composition with that of the gypsum-beds. This deposit continues until the water has lost 8 per cent. more of its original volume; then all precipitation ceases till 2 per cent. more of the original quantity of water has evaporated away. Then a new deposit begins, not of gypsum, but of chloride of sodium, or sea-salt. * * * The deposition of pure or commercial salt continues till the volume of the water has been again reduced by one-half, when a precipitation of sulphate of magnesia begins to take place with it. This continues, the two salts being deposited in equal quantities, till only 3 per cent. of the original quantity of water is left. Finally, when the water has been concentrated to 2 per cent., carnallite, or the double chloride of potassium and magnesium is deposited. Spontaneous evaporation cannot go much further. The residual mother-water will not dry up at the ordinary temperature even in the hottest regions of the globe; its chief constituent is chloride of magnesium. A body of sea-water, evaporated naturally, will then leave a series of deposits in which we will find, as we dig down, the following minerals in order: deliquescent salts, including chiefly chloride of magnesium; carnallite, or the double chloride of potassium and magnesium; mixed salts, including chloride of sodium and sulphate of magnesia; sea-salt, mixed with sulphate of magnesia; pure sea-salt; pure gypsum; weak deposits of carbonate of lime with sesquioxide of iron, etc.

The correspondence between the succession of salts formed by the evaporation of sea-water, and the succession found in many saline deposits now worked for rock salt, is of great interest, and no doubt explains the genesis of some saline deposits. It is not always necessary, however, in the explanation of the presence of salts in lenticular basins to assume that the deposits commenced with isolated portions of sea-water. On the contrary the study of inclosed basins indicates that deposits of this nature sometimes result from the long continued concentration of ordinary river-waters. The presence of salt or fresh water mollusks associated with saline

⁶⁴ Report of Juries: International Exhibition, 1862, Class II, pp. 48-54.

⁶⁵ October, 1882.

deposits, in some instances, gives evidence as to whether the beds in which they occur were precipitated from ocean or inland waters.

The precipitation of salts in inclosed lakes is still farther illustrated by Great Salt Lake, Utah, the composition of which in the years 1850, 1869, and 1873, is given in Table C. At the present time the lake is lower than in 1873, when the last analysis was made, but there is no reason to suppose that there has been any change in the salts with which the waters are charged. As in all inclosed lakes, the percentage of total salts in a given quantity of the brine changes as the waters rise and fall. To illustrate, the amount of saline matter contributed to Great Salt Lake during a single year, for example, is so small in comparison with the quantity which the lake holds in solution, and varies so little from year to year, that the composition of the residue obtained by evaporating a sample of the lake brine would remain practically constant for a long period, provided precipitation did not take place. The amount of water reaching the lake varies with the seasons, and also undergoes secular fluctuations, dependent on climatic changes, extending over a term of years. The brine is thus diluted when the lake is unusually full, and greatly concentrated when the lake is reduced abnormally by evaporation.

Owing to the large amount of sodium sulphate dissolved in the waters of Great Salt Lake, and since it is much more soluble in warm than in cold water, its precipitation takes place during cold weather. When the temperature rises it is redissolved. If the waters of the lake are cooled artificially to about 20° Fahrenheit, an abundant precipitation of flocculent sodium sulphate takes place. Each year, on the approach of cold weather, the waters of the lake lose their transparency and become cloudy and opalescent, owing to the precipitation of sodium sulphate in a state of minute subdivision. In the depth of winter the temperature of the atmosphere about the lake sometimes falls as low as -20° F. On these occasions sodium sulphate is precipitated in immense quantities and collects along the shores in thousands of tons. Nature has here anticipated Balard's process for obtaining sodium sulphate, and is carrying on the operation on a grand scale.

From the analyses of the tributary streams we know that large quantities of calcium carbonate are contributed to Great Salt Lake in solution; but the chemist fails to find this salt in the brine itself. The extreme scarcity of animal and plant life in the waters shows that it could not be removed by organic agencies; it must, therefore, either be precipitated or perhaps in part decomposed and changed to the chloride. The very small percentage of calcium in the lake, however, is sufficient proof that this element must have been precipitated, probably as the carbonate, when the river and lake waters were mingled. The presence of large quantities of oolitic sand along the shores of the lake, which is apparently still in process of formation, is strong evidence in support of this hypothesis. This lake furnishes a typical instance of the concentration of ordinary meteoric waters by evaporation. We may conclude, therefore, from this and other instances which might be enumerated, that in inclosed lakes, as in the ocean, calcium carbonate will be the first salt precipitated as evaporation progresses.

Great Salt Lake is now so concentrated that the crystallization of common salt is taking place in certain portions where the water is shallow. Over hundreds of acres along its southwest border the bottom is covered with a continuous crust of salt crystals, forming a pavement sufficiently strong to support a horse and rider. This condition was observed during the arid season; whether the salt is redissolved during the rainy season or not, has not been determined. From the observations recorded above we learn that precipitation is now taking place in three separate ways in the waters of a single lake; (*a*) calcium carbonate is thrown down, probably throughout the year, as the tributary streams mingle with the brine of the lake; (*b*) sodium sulphate is precipitated in all portions of the lake when its temperature falls below 20° F.; (*c*) sodium chloride crystallizes in the very shallow portions during the arid season. An example of this nature teaches that a stratified saline deposit might form in an inclosed basin as a result of fractional crystallization dependent upon changes of temperature. The deposits found in the smaller of the Soda Lakes at Ragtown, Nevada (see page 79), apparently illustrate such an occurrence.

DEPOSITION OF CALCIUM CARBONATE.

In considering the natural methods by which calcium carbonate is precipitated from solution, we have, as preliminary data, that this salt is more abundant than any other in ordinary surface waters, constituting, usually, nearly one-half of the total of solids in solution in average rivers; that it is the first to be precipitated when such waters are evaporated; and that calcium ordinarily exists in solution as the bicarbonate, CaO CO_2 , the presence of free carbon dioxide (carbonic acid) being essential for its solution.

Under the conditions prevalent in nature it is evident, from the elementary laws of chemistry, that the precipitation of calcium carbonate may take place in at least three ways: (a) By evaporation, concentration being carried beyond the point of saturation. (b) By the loss of the carbon dioxide necessary to hold the salt in solution. This gas escapes when pressure is removed or temperature increased; it passes off gradually when carbonated waters are exposed to the air, especially if agitated, as in the spray of water-falls and in breaking waves. (c) By chemical reaction, as when an alkaline carbonate is added to water holding calcium chloride in solution. Of these three methods we need to consider at this time only the results of concentration and loss of carbon dioxide; as dissolved gases are driven off during evaporation, these two methods act together. So far as the chemistry of inclosed lakes is concerned it is evident that the precipitation of calcium carbonate must depend almost entirely on concentration by evaporation; chemical reaction may in certain cases play an important part, as when a spring holding CaO CO_2 rises in an alkaline lake; but, in general, the conditions under which a number of salts may exist in a solution is too little known to warrant one in ascribing a reaction to this cause when it may be more simply explained as a result of evaporation.

With this elementary sketch of the chemistry of natural waters we will proceed with our study of the history of Lake Lahontan.

SECTION 2.—CHEMICAL DEPOSITS OF LAKE LAHONTAN.

In commencing the study of the chemical precipitates of Lake Lahontan, we have for our guidance the fact that the rivers now entering the basin flow through the same channels that they occupied during the Quaternary, and that many of the springs which rose in the bottom of the former lake are still active. The salts contributed to the former lake were, therefore, of essentially the same nature as those now being carried into the basin. From these data and a knowledge of the composition of the present lakes of the basin, it is evident that at least the general chemistry of the waters of the former lake may be inferred. Providing that no salts were deposited in the basin during an antecedent period of desiccation, it is evident from the character of the inflowing waters, that during its first rise Lake Lahontan was a fresh-water lake, with about the normal percentage of calcium carbonate but richer in sodium salts than is common with ordinary lakes in regions where stratified rocks abound. We need to qualify this statement, perhaps, for the reason that the lake rose slowly, owing to a gradual change from arid to more humid conditions, and became somewhat concentrated during its gradual increase. At the time of its first maximum it must have been somewhat more highly charged with mineral matter than is usually present in lakes with outlet. Should a climatic change take place which would allow Pyramid Lake to expand at such a rate that at the end of a hundred years, for example, it would be 900 feet deep, *i. e.*, refill the Lahontan basin, it would form a fresh-water lake in which the chemist could detect a somewhat greater percentage of saline matter than occurs in the Laurentian lakes; but to the taste it would appear as fresh as ordinary river waters. Such, we conceive, was the nature of Lake Lahontan at its first rise.

From our knowledge of the chemistry of natural waters we should expect that calcium carbonate would be the first precipitate formed as the waters of Lake Lahontan were concentrated, and should evaporation and precipitation balance each other for a considerable time, an immense deposit of this salt would be accumulated. If loss and supply were balanced

TUPA OF THE AT MOUNTAIN RANGE, NEVADA, SHOWING SUCCESSIVE STAGES

CHEMICAL DEPOSITS OF LAKE LAHONTAN.

In following the study of the chemical precipitates of Lake Lahontan we have for our guidance the fact that the rivers now entering the lake occupy the same channels that they occupied during the Quaternary, and that many of the springs which rose in the bottom of the lake are still active. The salts contributed to the former lake were, therefore, of essentially the same nature as those now being carried into the lake. From these data and a knowledge of the composition of the present lake of the basin, it is evident that at least the general chemistry of the waters of the former lake may be inferred. Providing that no salts were deposited in the basin during an antecedent period of desiccation, it is evident from the character of the inflowing waters, that during its first rise Lake Lahontan was a fresh-water lake, with about the normal percentage of calcium carbonate but richer in sodium salts than is common with ordinary lakes in regions where stratified rocks abound. We need not qualify this statement, perhaps, for the reason that the lake rose slowly, owing to a gradual change from arid to more humid conditions, and became somewhat concentrated during its gradual increase. At the time of its first maximum it must have been somewhat more highly charged with saline matter than is usually present in lakes with outlet. Should a climatic change take place which would allow Pyramid Lake to expand at such a rate that at the end of a hundred years, for example, it would be 100 feet deep, *i. e.*, refill the Lahontan basin, it would form a fresh-water lake in which the chemist could detect a somewhat greater percentage of saline matter than occurs in the Laurentian lakes; but to the taste it would appear as fresh as ordinary river waters. Such, we conceive, was the nature of Lake Lahontan at its first rise.

From our knowledge of the chemistry of natural waters we should expect that calcium carbonate would be the first precipitate formed as the waters of Lake Lahontan were concentrated, and should evaporation and precipitation balance each other for a considerable time, an immense deposit of this salt would be accumulated. If loss and supply were balanced

TUFA CRAG AT ALLEN'S SPRINGS, NEVADA, SHOWING SUCCESSIVE DEPOSITS.

for a long period, or if evaporation were to exceed supply, we should expect that other salts would be deposited in a definite succession. The probable composition of the waters of Lake Lahontan, if a single evaporation is considered, indicates that, as concentration took place, the dissolved salts would be deposited, with some intermixture it is true, but mainly in the following order: (1) Calcium carbonate; (2) calcium sulphate; (3) sodium sulphate; (4) sodium carbonate; (5) sodium chloride, followed by the precipitation of the more deliquescent salts. In nature, however, this order would be altered by fluctuations of temperature, variations in density, and other disturbing conditions. Should the desiccation be incomplete the remaining waters would form a dense mother-liquor, rich in magnesia, potash, and soda, and containing some of the less common substances, as lithium, boric acid, etc.

On entering the Lahontan basin—which, as we know, never overflowed—with this theoretical history before us, we are surprised to find that, with the exception of immense deposits of calcium carbonate, there are no accumulations of saline precipitates to be seen. Moreover, the water-bodies now occupying the lowest depressions in the bed of the former lake, are not dense mother-liquors, but, on the contrary, contain even less than half of one per cent. of total solids in solution. It is evident, therefore, that the history we are endeavoring to trace is an exception to the rule sketched above, which seemed self evident when considered in a theoretical way. As we proceed we hope to explain this apparent anomaly, at least in part.

CALCAREOUS TUFA.

The deposits of calcium carbonate occurring in the Lahontan basin are most abundant in the valleys where the former lake was deepest, and are usually inconspicuous or, perhaps, entirely wanting in places where the waters were shallow. The best localities for the study of these chemically formed rocks are on the borders of the Carson Desert and about the shores of Pyramid and Winnemucca lakes. The steep rocky sides of these secondary basins, and the isolated buttes occurring in them, seem to have been

especially favorable for the deposition and preservation of calcareous deposits. The tufa frequently forms a sheathing 50 or 60 feet thick upon the older rocks; at other times it assumes the form of domes and castellated masses that in some cases rise a hundred feet above the nuclei about which crystallization first took place. Of all such localities in the basin the most remarkable are the Marble Buttes at the southern, and the Needles at the northern end of Pyramid Lake; Anaho and Pyramid islands are also loaded with immense accumulations of tufa, and are points of special attraction to the student of chemical geology.

Early in the examination of these deposits it was found that they occur in definite layers, and form a well-defined sequence in which three main divisions, together with many minor variations, may be easily traced. Classifying the major divisions according to the structure of the rock, beginning with the first formed, we have: (1) Lithoid tufa; (2) Thinolitic tufa; (3) Dendritic tufa.

LITHOID TUFA.

We have applied this name to the first of the three main deposits of calcium carbonate precipitated from the waters of Lake Lahontan. It is compact and stony in structure, light yellowish gray in color, and weathers into forms of extreme ruggedness. It frequently shows a concentric and sometimes a well-marked tubular structure when seen in cross-section, but when forming a coating to rock surfaces it is usually composed of thin, superimposed layers. In well-exposed sections of lithoid tufa the banded structure of the deposit is often distinctly marked, and at times, particularly near the base of the deposit, or near the center of the dome-shaped masses occurring in isolated positions, the layers of tufa having a compact stony structure are separated by others of dendritic tufa, the character of which will be described a few pages farther on. Viewed externally, the coatings of this variety of tufa on cliffs and buttes appear to be formed of comb-like masses, imbricated in such a manner as to resemble a massive thatch. This appearance can only be seen to advantage above the limit of the more recent tufas; it is especially well displayed on the upper portions of Anaho Island and the Marble Buttes. Much of the gravel forming the prelacustral alluvial slopes of the Lahontan basin, as well as that composing the earlier-

formed terraces and embankments, is cemented by it into a compact conglomerate.

Lithoid tuffa is found nearly everywhere throughout the valleys formerly occupied by Lake Lahontan, where the conditions for its deposition and preservation were favorable. In vertical range it occurs from the lowest part of the basin now open to inspection, up to a horizon about thirty feet below the highest of the ancient beaches. The broad wave-cut shelf, which, so far as can be determined, is the upper limit of this variety, we have called the Lithoid terrace (see page 101). At its upper limit this tuffa is seldom more than eight or ten inches in thickness, as it remains to-day after a long period of weathering; but lower in the basin it attains a thickness of ten or twelve feet; what its maximum development may be is difficult to determine, as its base is nearly always concealed by lacustral deposits or later formed tuffas.

The surface of the lithoid tuffa when exposed by the removal of the sheathing of thinolite crystals that usually covers it below the horizon of

FIG. 27.—Section showing current-bedded gravels between lithoid and thinolite tuffa.

the thinolite terrace, sometimes shows the effect of weathering which took place previous to the deposition of the second formed variety. In places the two layers are separated by a deposit of pebbles two or three feet in thickness, united by a calcareous cement, or by current-bedded gravels, as shown in the following drawing of a section exposed at the eastern base of the Marble Buttes. In some instances stones and pebbles were carried

upwards by the action of sub-lacustral springs about which tufa was being deposited, and became inclosed in the calcium carbonate as it was precipitated; this occurrence is not to be mistaken, however, for the partings of current-bedded gravel described above, which must have been deposited by waves and currents in shallow water. The weathering of the lithoid tufa is not always apparent, but has been observed in a number of instances, and can only be interpreted on the supposition that the first-formed tufa was exposed to subaërial erosion by a lowering of the lake previous to the deposition of the thinolite crystals. The surface of the lithoid tufa above the upper limit of thinolite is weathered to a much greater extent than below that horizon, indicating that its erosion continued throughout the low-water stage during which thinolite was forming.

The lithoid tufa of the Lahontan basin is identical in structure and general appearance with the greater part of the tufa deposited in Lake Bonneville, and has essentially the same chemical composition. It is also represented on a limited scale in a number of the minor Quaternary lake basins of Utah and Nevada. Similar deposits are now forming in Pyramid, Walker, and Winnemucca lakes, as described in Chapter III. It is evident that this variety of tufa corresponds in all respects with the first calcareous deposit precipitated when ordinary meteoric waters are evaporated.

THINOLITIC TUFFA.

Succeeding the lithoid tufa in order of deposition, and forming another coating on the sides of the Lahontan basin, is a deposit of interlaced crystals of calcium carbonate, which were called "Thinolite" by Mr. King.⁶⁶ In the reports of the U. S. Geological Exploration of the Fortieth Parallel, however, this term is used to designate any of the calcareous deposits of the ancient lake, whether crystallized or not. In the present report we restrict the name to the variety of tufa exhibiting a definite crystalline structure, presently to be described. We may remark, in passing, that no crystals having a resemblance to thinolite have been found in the Bonneville basin; nearly all the calcium carbonate there deposited is of the character of lithoid tufa, as

⁶⁶ U. S. Geological Exploration of the Fortieth Parallel. Washington, 1878, Vol. I, p. 517.

WATER SURFACE ON LAKE LAHONTAN AT THE THIOOLITE STAGE.

formed by the action of sub-lacustral springs about which tufa was being deposited, and became inclosed in the calcium carbonate as it was precipitated; this occurrence is not to be mistaken, however, for the partings of current bedded gravel described above, which must have been deposited by waves and currents in shallow water. The weathering of the lithoid tufa is not always apparent, but has been observed in a number of instances, and can only be interpreted on the supposition that the first-formed tufa was exposed to subaërial erosion by a lowering of the lake previous to the deposition of the thinolite crystals. The surface of the lithoid tufa above the upper limit of thinolite is weathered to a much greater extent than below that horizon, indicating that its erosion continued throughout the low-water stage during which thinolite was forming.

The lithoid tufa of the Lahontan basin is identical in structure and general appearance with the greater part of the tufa deposited in Lake Bonneville, and has essentially the same chemical composition. It is also represented on a limited scale in a number of the minor Quaternary lake basins of Utah and Nevada. Similar deposits are now forming in Pyramid, Walker, and Winnemucca lakes, as described in Chapter III. It is evident that this variety of tufa corresponds in all respects with the first calcareous deposit precipitated when ordinary meteoric waters are evaporated.

THINOLITIC TUFFA.

Succeeding the lithoid tufa in order of deposition, and forming another coating on the sides of the Lahontan basin, is a deposit of interlaced crystals of calcium carbonate, which were called "Thinolite" by Mr. King.⁶⁶ In the reports of the U. S. Geological Exploration of the Fortieth Parallel, however, this term is used to designate any of the calcareous deposits of the ancient lake, whether crystallized or not. In the present report we restrict the name to the variety of tufa exhibiting a definite crystalline structure, presently to be described. We may remark, in passing, that no crystals having a resemblance to thinolite have been found in the Bonneville basin; nearly all the calcium carbonate there deposited is of the character of lithoid tufa, as

⁶⁶U. S. Geological Exploration of the Fortieth Parallel. Washington, 1878, Vol. I, p. 517.

Julius Bien & Co. Lith.

WATER SURFACE ON LAKE LAHONTAN AT THE THINOLITE STAGE.

Scale: 29 miles = 1 inch

stated in the preceding paragraph. In a few instances, however, a dendritic structure may be detected; as is the case, also, in the lithoid deposits of the lake we are now studying.

In the Lahontan basin thinolite crystals are only found in the lowest depressions, as, for example, about the shores of Pyramid and Winnemucca lakes and on the borders of the Carson Desert. Its geographical extent, as shown on the accompanying map, embraces the Carson Desert, the valleys of Pyramid and Winnemucca lakes, together with the Black Rock and Smoke Creek deserts. The divide between Carson Desert and the valley in which Pyramid Lake is situated, is higher than the upper limit of the thinolite tufa; we must conclude, therefore, that when Lake Lahontan evaporated away sufficiently to admit of the formation of thinolite—or of the crystals after which it is a pseudomorph—the water-surface was below the level of the pass to the eastward of Wadsworth, and the lake consequently, divided into at least two water-bodies. On the preliminary map of Lake Lahontan, published by the writer in the Third Annual Report of the U. S. Geological Survey, the lake at its thinolite stage is represented as extending through from the Carson Desert to Pyramid Lake; this error has been corrected on the accompanying map. It was also indicated on the previous map, that Smoke Creek and Black Rock deserts were without thinolite deposits; later observations have shown that they do occur in large masses at certain localities on the borders of these basins, with the same general relations to the other tufa deposits that they have in the most typical localities.

The valley of Walker Lake must also have formed an independent water-body during the thinolite stage of Lake Lahontan, but no crystals belonging to this period of the lake's history have been found in that basin. As will be described later, there are masses of thinolite about Walker Lake corresponding to quite recent deposits of the same mineral in the Black Rock Desert.

In its vertical range the thinolite is limited by the broad shelf, named the thinolite terrace, which occurs at an elevation of 110 feet above the 1882 level of Pyramid Lake. In only a single instance has the thinolite been observed to extend above this horizon. On Anaho Island the terrace

is strongly carved and forms a conspicuous feature in the contour of the island when seen from a distance; on the northern side of the island the thinolite tufa extends about 15 feet above the water-line of the terrace and forms a thin wedge of interlaced crystals included between the lithoid tufa and the heavy deposit of dendritic tufa. The upper limit of the thinolite probably varies in the several basins in which it occurs, but no accurate measurements of differences of level have been made.

The sheathing of thinolite extends from the lithoid terrace down to the lowest point in the bottom of the basin now open to inspection. Near its upper limit it is from 6 to 8 feet thick, but increases to 10 or 12 feet near the surface of Pyramid Lake. Like the lithoid tufa it was deposited in successive layers, as is shown by its banded structure. Throughout the mass we find definite layers or zones of small and large crystals alternating with each other. Near its outer limit the bands of crystals are divided by narrow layers of sheets of dendritic tufa; indicating that the condition of crystallization were alternately favorable for the production of the crystalline or the dendritic structure. The circumstances favorable for the formation of the latter finally prevailed, and only dendritic tufa was deposited.

PROFESSOR DANA'S CRYSTALLOGRAPHIC STUDY OF THINOLITE.

While carrying on the field study of Lake Lahontan, large quantities of the different varieties of tufa were collected, and special attention given to securing as many specimens as could well be desired for illustrating the structure and mode of occurrence of thinolite. A representative portion of this collection, together with similar material from the Mono Lake basin, was placed in the hands of Profs. G. J. Brush and E. S. Dana for the purpose of obtaining an authoritative statement of the mineralogical relations of thinolite. This study was finally undertaken by Professor Dana, whose report forms Bulletin No. 12 of the publications of this Survey. To the student of Lahontan history this report is especially welcome as it clears away the previous hypothesis, advanced by King, to the effect that thinolite is a pseudomorph after gaylussite. The following description of thinolite is quoted with slight verbal alterations from Professor Dana's bulletin.

A CHARACTERISTIC SPECIMEN OF THINOLITE.

tin⁶⁷ to which the reader should refer for a more complete elucidation of the subject.

In general it may be said that the thinolite collected from different localities, both in the basin of Lake Lahontan and of Mono Lake, while varying widely in external aspect, is yet remarkably uniform in all essential characters. It is thus established beyond question that the original mineral deposited was throughout the same, although, in consequence of the varied conditions to which it has been subjected, the forms resulting from its alteration are very diverse. Thus, in some specimens there is only a delicate skeleton remaining, the whole consisting of thin plates, held together in their parallel position by a slight central frame-work, while in others the whole is as firm and compact as a crystalline limestone, and between the two extremes many interesting varieties occur. The most important condition upon which this difference depends is the varying extent to which a deposition of calcium carbonate has taken place subsequent to the first alteration of the original mineral.

As has already been stated, the thinolite is most characteristically developed about Pyramid Lake. The writer has had in hand specimens from the Marble Buttes, from the Needles, from Anaho Island, and from the Domes, and, as they illustrate well the different varieties, it will be convenient to refer to them by localities, although no special significance is probably to be attached to the particular spot from which the individual specimens were collected.

The delicate, open, porous variety of thinolite is best shown in the specimens from the Marble Buttes, of which illustrations are given in Plates XXXII and in Fig. 1 of Plate XXXIII. The external form of the crystals is roughly that of a rectangular prism, with projecting edges and generally tapering toward the extremities. The color is gray to brown. These crystals are commonly from a quarter of an inch to an inch in diameter and up to 8 or 10 inches or more in length. They are generally grouped in a more or less closely parallel position, often compactly, with only very little interlacing. In other cases, especially when the forms are

⁶⁷ Page 15, et seq.—The numbers referring to Plates in this quotation have been changed so as to denote their position in the present volume.

smaller, they have widely divergent positions, interpenetrating each other, and giving a large mass an open, reticulated appearance. In addition to the elongated crystals, numerous smaller ones, half an inch or an inch in length, make up parts of these masses, projecting from the sides of the larger crystals and forming divergent groups among themselves. The small crystals have generally the form of an acute pyramid, and are sometimes square in outline, sometimes rhombic; the sides are usually concave, and the edges project sharply. The exterior surface of the larger crystals is rough and open, often with a delicate mossy covering, and the whole crystal is porous throughout, as if eaten out so as to leave only a skeleton behind. Upon a superficial examination no regularity in the structure is evident, but on looking more closely it is seen that the apparently rough and irregular surface is made up of portions of thin plates, each set parallel to the sides of the crystal and uniformly converging in one direction. Thus when one of the groups of nearly parallel crystals is viewed end on, from one extremity or the other, it is seen that the edges of the plates, irregular as they are in outline, are all presented to view at once, as if each crystal, though prismatic in general outline, were made up of a series of acute skeleton pyramids, hopper-like in form, placed one within another. Still further, when the section produced by the cross-fracture of one of these elongated crystals is examined, there is seen, more or less distinctly, a series of apparently rectangular ribs forming concentric squares or rectangles, with diagonal ribs joining the opposite angles.

The specimens in hand from the Needles, Pyramid Lake, correspond closely with those which have been described, though hardly showing the structure so clearly. This is also true of some of those from Anaho Island. The majority from the latter locality, however, are much more firm and compact. Here, too, the crystals are usually elongated, and in a single specimen grouped in nearly parallel position. The edges of the plates are also commonly distinct on the sides, and show the same convergence toward one extremity. The masses, however, instead of being open and porous, and consequently light in the hand, are close, compact, and heavy. Instead of the delicate, open skeleton, with fretted surface, seen in the cross-fracture, the section is nearly solid, and sparkles with the reflection from the cleavage.

INSTITUTIONAL REPORT

The following report was prepared by the Institutional Committee on the basis of the information furnished by the various departments of the institution during the year ending June 30, 1900. The report is divided into two parts, the first of which contains a general statement of the work of the institution, and the second of which contains a detailed statement of the work of each of the departments. The first part of the report is divided into three sections, the first of which contains a statement of the general work of the institution, the second of which contains a statement of the work of the various departments, and the third of which contains a statement of the work of the various committees. The second part of the report is divided into two sections, the first of which contains a statement of the work of each of the departments, and the second of which contains a statement of the work of each of the committees. The report is prepared in accordance with the instructions of the Board of Trustees, and is intended to give a full and complete statement of the work of the institution during the year ending June 30, 1900.

EXPLANATION OF PLATE XXXIII.

- FIG. 1. Group of thinolite crystals from Marble Buttes, Pyramid Lake (reduced one-half); open porous variety.
- FIGS. 2 and 3. Transverse sections, natural size; Fig. 2, open skeleton form; Fig. 3, partially filled up with amorphous CaCO_3 . These sections show the system of rectangular (square) and diagonal ribs, which consist of granular crystalline CaCO_3 .
- FIG. 4. External appearance (reduced one-half) of a single crystal, with part of a second, the internal structure of which shows that it has but a single termination; the comparatively smooth surface is due to the secondary deposition of CaCO_3 .
- FIG. 5. Longitudinal section of open variety (reduced one-half), showing the two systems of plates converging upward at an angle of about 35° .
- FIG. 6. Complete crystal (reduced one-half) which yielded the section in Fig. 2; the line in which the section was made is indicated.
- FIG. 7. Acute pyramidal crystal (reduced one-half) which yielded at its base the section given in Fig. 3.
- FIG. 8. Square pyramidal crystal (reduced one-half) which gave, at the point indicated, the section in Fig. 13; the surface has been made smooth by subsequent deposition of CaCO_3 .
- FIGS. 9 and 10. Skeleton crystals (natural size) showing cap-in-cap structure, and thus revealing the true square pyramidal form of the original mineral.
- FIG. 11. Crystals (natural size) from the Domes, Pyramid Lake; the surface smoothed over by subsequent depositions of CaCO_3 , with sproutings from the edges and extremities.
- FIG. 12. Section (magnified 8 times) of a crystal from the Domes, like that in Fig. 11, showing a diagonal and rectangular frame-work, partly crystalline, granular, partly amorphous, with layers of secondary carbonate opal-like in structure.
- FIG. 13. Section (natural size) of the crystal shown in Fig. 8, cut transversely at point indicated; it shows the same frame-work of granular crystalline carbonate, partially filled in with secondary CaCO_3 .
- FIG. 14. Section (natural size) showing the usual frame-work, partially filled in with secondary CaCO_3 , and with successive layers also around the outside.
- FIG. 15. Section of a crystal from the Marble Buttes, magnified 8 times, and showing the structure lines of crystallized carbonate, and also in the cavities the acicular crystals of aragonite. (?)
- FIGS. 16 and 17. Small pyramidal crystals (natural size), showing by dissection the cap-in-cap structure, and thus, like Figs. 9 and 10, revealing the true pyramidal form of the original mineral.

ILLUSTRATIONS OF THE STRUCTURE OF THINOLITE.

surfaces of the calcite grains. In other cases the outer surfaces are smooth and rounded, and the unaided eye sees little of the structure except on a cross-fracture; in these instances, as will be more fully explained immediately, a deposition of calcium carbonate has filled up the skeleton form and incrustated and smoothed over the surface.

The specimens from the Domes represent still another type of the thinolyte. The crystals here have uniformly an acute pyramidal form, and are grouped in irregular, divergent positions. Their surfaces are brownish yellow in color and show little of the edges of the parallel plates conspicuous in the variety from the Marble Buttes. They are, on the contrary, nearly smooth, except when covered with watery excrescences, which in some cases are thickly clustered about the edges and extremities. One of these crystals (natural size) is shown in Fig. 11, Pl. XXXIII. On the fracture this variety is found to be nearly as firm and compact as a fine-grained crystalline limestone; in fact, the unaided eye would regard the whole as crystalline throughout. The color on the fracture is slightly yellowish white.

Examination of sections of crystals.—In order to get at the true structure of the crystals which have been described, it is necessary to resort to sections cut transversely and longitudinally; these reveal the form most clearly and satisfactorily. A cross-section of a crystal like those first described—the open, porous variety from Marble Buttes—is shown in Fig. 2 (natural size). As seen in the figure it is made up of lines in position parallel to the sides of a square prism, and in addition there are two sets of distinct diagonal lines intersecting at right angles to each other; between these ribs are open spaces. A closer examination of the specimen represented in Fig. 2 shows that the material consists of rhombohedral calcium carbonate, or calcite, of a distinctly granular crystalline structure throughout. The whole presents an open tessellated appearance. The external form of the crystal which yielded Fig. 2 is shown reduced one-half in Fig. 6. The point at which it was divided is indicated by a black line. The form is roughly that of a square prism tapering slightly in both directions, but the external form does not conform, in this respect, to the internal structure except at the upper extremity. The irregular edges of the upwardly converging plates are clearly shown in this figure.

A longitudinal section of another crystal (one-half natural size) is shown in Fig. 5. It presents also an open skeleton appearance analogous to that of Fig. 2. As seen in the figure the plates converge upwards on either side of the longitudinal axis, meeting at an angle of approximately 35° . Like the previous case, it consists entirely of purely granular crystallized calcite with only a little mossy covering on the surfaces of the plates. It is to be noticed here that the plates all converge upwards from one extremity of the crystal to the other, and this, as will be remarked later, is almost universally true even in the case of crystals, the external form of which tapers off at both ends.

Another transverse section (natural size) is shown in Fig 3. It is like Fig. 2 in most respects, except that the square is elongated in one direction and the diagonals meet in a central rib. Moreover while the skeleton frame-work consists as before of crystallized calcite (left white in the drawing), the intermediate spaces are partially filled up with a secondary deposit of calcium carbonate, which is apparently amorphous, and has been deposited in granular form and, too, in lines parallel to the crystalline plates. This subsequent deposition, however, has not gone far, and the general appearance is nearly as open as the one first described. The outline of the crystal which yielded this section is shown in Fig. 7 (reduced one-half). As seen here it tapers gradually to the terminal edge, forming a sharp extremity. The external form approximates to the true crystalline form of the original crystal, but is somewhat more acute, as shown by the edges of the plates exposed on the surfaces, and by the angle at which the plates within converge.

In Fig 13 another section is given (natural size). This shows much the same tessellated appearance, the structure being essentially the same as in the others described, but the secondary deposition of amorphous calcium carbonate has gone still further, so that as a whole it is more compact. The skeleton ribs parallel to the sides and the diagonals are, however, still very distinct and entirely crystalline. The form of the crystal which gave this section is shown in Fig. 8 (one-half natural size). As seen here it is an acute square pyramid, approximately conforming in outward form to the internal structure. The surface is here no longer open and fretted,

EXPLANATION OF PLATE XXXIV.

- FIG. 18. Thinolite from Black Rock Desert (reduced one-half), the individual crystals running off into a compact stony tufa, so that the mass from above has a cauliflower-like form.
- FIGS. 19 and 20. Thinolite from Mono Lake, California (natural size), showing the grouping of the composite crystals.
- FIG. 21. Thinolite from Mono Lake (natural size), fragment of a large composite crystal, made up of small acicular crystals in parallel position.
- FIG. 22. Transverse section of the crystal represented in Fig. 21, showing the same skeleton structure distinct in crystals from Pyramid Lake (Figs. 2, 3, etc.).
- FIGS. 23 and 24. Group of thinolite crystals from Mono Lake (natural size), showing the acicular form, and also the way in which the crystals are coated over with secondary carbonate.
- FIG. 25. Group of small crystals (magnified 4 times) from Mono Lake, showing the same method of grouping common in the Sangerhausen pseudomorphs, as shown in Fig. 26.
- FIG. 26. Group of Sangerhausen pseudomorphs (natural size); compare Fig. 25.
- FIGS. 27 and 28. Isolated thinolite crystals (magnified twice), showing resemblance in form and surface marking to Sangerhausen crystals; compare Figs. 31 and 32.
- FIG. 29. Thinolite crystal (natural size), showing cap-in-cap pyramidal structure, similar to Figs. 16 and 17, Plate II.
- FIG. 30. Thinolite crystal (magnified 4 times), showing resemblance in form to the Sangerhausen pseudomorphs; compare with Figs. 31, 32, and 38.
- FIGS. 31 and 32. Single Sangerhausen crystals, showing form and external markings; Fig. 31, natural size; Fig. 32, magnified twice.
- FIG. 33. Group of small thinolite crystals (magnified 4 times); compare with Fig. 26.
- FIGS. 34 and 35. Pseudomorphous crystals, consisting of granular calcite from Astoria, Oregon; copied (reduced one-half) from figures by J. D. Dana in the *Geology of U. S. Exploring Expedition*, p. 656.
- FIGS. 36 and 37. Pseudomorphous crystals, consisting of granular calcite, from New South Wales; copied (reduced one-half) from figures by J. D. Dana in the *Geology of the U. S. Exploring Expedition*, p. 481.
- FIG. 38. Pseudomorphous crystal (natural size) from Kating, Silesia.

ILLUSTRATIONS OF THE STRUCTURE OF THINOLITE

as in the others, but nearly smooth, except as it is covered with small wart-like prominences. The color is a dark brown. The line in which the section was cut is shown in the figure.

Still another section is shown in Fig. 14 (natural size), and one which marks a further degree of deposition of secondary calcium carbonate. The crystal from which it was taken had a square form tapering slowly upward, and the surface was covered with small mammillary prominences. The skeleton of crystalline calcium carbonate is here nearly concealed by the added amorphous material, and the outer portion consists of concentric layers of the same substance.

The exterior appearance of another crystal is shown in Fig. 4 (one-half of natural size). As seen, it tapers slightly toward both extremities, and it was cut longitudinally, in the idea that it might be a doubly terminated crystal, but the structure lines all converged toward one end, showing that, like most of the others, the growth was only in one direction. As the surface indicates, the crystalline skeleton has been nearly filled up with amorphous calcium carbonate.

In addition to the sections given and others like them of large crystals, numerous thin sections were also cut transverse and longitudinal to smaller crystals. They revealed under the microscope the same points which the microscopic examination of the larger sections showed—that is, the presence of the same skeleton of crystallized calcium carbonate with the concretionary depositions added to it. The calcite grains are large, each one having a distinct rounded or elliptical outline, and they are packed closely together, with a little brownish amorphous matter between them. Many of them show the rhombohedral cleavage; others show a crystalline nucleus which has apparently grown by the addition of further crystalline matter. The secondary calcium carbonate has generally a concentric or banded structure resembling some kinds of opal.

These sections also show another point of interest; namely, the presence of groups of acicular crystals in parallel position filling more or less completely the cavities in the skeleton structure, and sometimes projecting into the cavities. These are seen in many cases, and are the general rule, though sometimes absent; they are indicated magnified eight times in Fig.

15. These acicular crystals show uniformly extinction parallel to their prismatic direction, and hence it seems clear that they must belong to an orthometric system. It seems probable that they are aragonite. A chemical examination of an uncovered slide gave results in accordance with this suggestion.

A section of one of the crystals from the Domes is shown in Fig. 12 magnified eight times. To the eye the broken crystal appeared to be crystalline throughout; in the section, however, as examined under the microscope, there is seen to be a crystalline frame-work made up of calcite grains, filled in with amorphous matter, and in addition outer layers of banded opal-like carbonate, so that it conforms in general to cases like those before represented. The diagonal lines are here clearly developed, and there are also rectangular lines more or less distinctly indicated. These are illustrated somewhat obscurely in the figures. Other sections showed essentially the same relations.

Structure in dissected crystals.—As has been stated, the external form of the thinolite crystals seldom gives the true crystalline form. The process of dissection, however, which has laid bare the skeleton-like ribs which have been described, sometimes results in showing the true pyramidal form of the original mineral. In such cases we may have a series of skeleton crystals, each a hollow pyramid as a cap to the one preceding. This is shown in Fig. 9, which will explain itself, and again in Fig. 10 (both natural size). In another case a mass of the calcareous tufa, showing little structure, has its surface partially covered with pyramidal crystals an inch in length. Each one was a skeleton crystal inclosing a pyramidal crystal, and sometimes several crystals after the fashion of a nest of pill-boxes. The outer surface of the crystals was incrustated with a moss-like covering, often entirely hiding the form. Two of these are represented in Figs. 16 and 17 (natural size), and another in Fig. 29, Plate XXXIV.

Before passing to the description of the next succeeding tufa deposit, we may note that the external surface of the thinolite does not exhibit evidence of having been weathered previous to the deposition of the den-

dritic variety. This may be taken as conclusive evidence that the lake surface did not fall below the horizon of the thinolite terrace subsequent to the deposition of thinolite until after the dendritic tufa was formed.

DENDRITIC TUFA.

A change in the chemical nature of Lake Lahontan, which terminated the crystallization of thinolite, is recorded by a third calcareous deposit, which, from its resemblance in structure to arborescent forms, we have called dendritic tufa. The conditions that brought about this change in the character of the calcium carbonate precipitated appears to have been a dilution of the waters in which the thinolite was deposited. This is evident from the fact that the dendritic tufa reaches a higher level than the layer of thinolite. This third variety is by far the most abundant of all the chemical deposits of Lake Lahontan, and occurs from the bottom of the basin up to an elevation of 320 feet above the level of Pyramid Lake in 1882. In many places it is not less than 50 or 60 feet in thickness and may at times exceed this amount. The principal precipitation took place at an elevation of between 200 and 300 feet above Pyramid Lake. The abundance of the accumulation at this horizon is so great that it gives a convex outline to the cliffs on which it was deposited, as may be seen at the Marble Buttes and on the islands in Pyramid Lake. It is frequently suspended from cliffs in pendent, comb-like masses, which sometimes suggest the appearance of Cyclopean tile-work, and present surfaces of extreme ruggedness. The aspect of cliffs when loaded down with tufa is well shown on Plate XXIV, Vol. I, of the reports of the United States Geological Exploration of the Fortieth Parallel, and is also represented on Plate XXXVI of the present volume. Like the lithoid and thinolitic tufas already described, the dendritic variety is yellowish gray in color and weathers into similar rough and angular forms. It is distinguishable at a glance, however, from the earlier varieties by its peculiar dendritic structure. In typical specimens, the sprays of tufa branch and expand from central nuclei, in such a manner as to appear not unlike twigs of cedar changed to stone. This arborescent or dendritic structure is shown on Plate XXXV, which is a reproduction of

a photograph of a section of a small dome or loaf-like mass, the top of which has been removed by weathering.

As the lake stood about 220 feet above the thinolite terrace when the highest deposit of dendritic tufa was formed, the geographical distribution of this variety is of broader extent than that of the thinolitic; but it is not so widely spread as the lithoid tufa.

It not only occurs in far greater abundance than either of the other varieties, but is found in various relations to the lacustral sediments, etc., which the other tufas have not been observed to present. In many localities on the deserts where nuclei of gravel, shells, etc., were present, the surface is frequently covered here and there with tufa-growths having a striking resemblance to mushrooms or tuberous roots, which are frequently spoken of as "fossil mushrooms," "fossil turnips," etc. A few characteristic examples of the pseudo-vegetable forms are represented on Plate XXXVII. Fig. A shows a growth about four inches high springing from a water-worn pebble; Fig. B, of one-third natural size, is a deposition of tufa on a rocky crag that projected an inch or two above the lake bottom; in Fig. C the deposition commenced about grains of sand; Figs. D and E show the tops of mushroom-shaped growths. At some localities the "mushrooms" occur of large size and form a continuous pavement over the surface of the former lake bottom, as may be seen along the road between Wadsworth and Pyramid Lake, and again in the Carson Cañon, north of Churchill Valley. At these localities the symmetrical outline of the tufa-forms has frequently been modified by the contact of one with another during their formation, so that now they are polygonal instead of circular in horizontal section. These masses are frequently hexagonal when seen from above and have rounded dome-shaped tops, which are sometimes hollowed out by the weathering of their summits and cellular interior in such a manner as to form irregular vases. In many instances the separate mushroom-like masses springing from independent nuclei are 10 or 15 feet in diameter and weigh many tons. In the walls of the cañons carved by the Humboldt and Truckee rivers through the sediments of Lake Lahontan sections are exposed of continuous layers of dendritic tufa, interstratified with marls and

A CHARACTERISTIC SPECIMEN OF DENDRITIC TUFA.

clays. The occurrence of evenly stratified lacustral beds, containing the shells of fresh-water mollusks, above the layer of dendritic tufa, is evidence that the lake rose after the precipitation of the tufa and was essentially fresh.

As in the earlier formed varieties, a section of the sheathing of dendritic tufa exhibits many alternating bands, showing that the deposition took place from without and was subject to many variations.

CHEMICAL COMPOSITION OF THE TUFA DEPOSITS.

Carefully collected samples of each of the varieties of tufa described above were submitted to Prof. O. D. Allen, of Yale College, for analysis, who reports their composition as follows:

Constituents.	Lithoid tufa.	Thinolitic tufa.	Dendritic tufa.
Insoluble residue	1.70	3.88	5.06
Lime (CaO)	50.48	50.45	49.14
Magnesia (MgO)	2.88	1.37	1.99
Oxide of iron and alumina	.25	.71	1.29
Carbonic acid (CO ₂)	41.85	40.90	40.31
Water (H ₂ O)	2.07	1.50	2.01
Phosphoric acid (PO ₅)	.30	trace.	trace.
Chlorine and sulphuric acid	trace.	trace.	trace.
Total	99.53	98.81	99.80

It will be seen from this report that the composition of the tufas gives no hint as to differences in the conditions under which they were deposited. With the exception of the insoluble residue, which may be considered in a measure as accidental—being in part foreign matter imprisoned during the precipitation of the tufa, and in part carried into the interstices of the rock as atmospheric dust after the desiccation of the basin—the various specimens have essentially the same composition. Special tests have been made in the case of thinolite to determine if in some instances it might not contain notable quantities of calcium chloride or other similar salt, but the results were negative. In common with all the tufa deposited in the Quaternary lake basins of the Far West, the several Lahontan varieties, as found at the present day, are simply impure calcium carbonate.

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

SUCCESION OF TUFA DEPOSITS.

The relation of the three varieties of tufa to each other, and the manner of their occurrence on the interior of the Lahontan basin, are indicated in the following ideal section of the lake shore:

FIG. 28.—Diagram showing succession of tufa deposits.

The first formed deposit, lithoid tufa, extends upward about 500 feet above the horizontal lake-beds occupying the bottom of the basin. The second deposit, thinolitic tufa, finds its upper limit about 100 feet above the present level of Pyramid Lake. The third and last, dendritic tufa, extends upwards to within approximately 200 feet of the highest shore-line. The lower limits of the tufas cannot be determined with accuracy, as they are concealed by lacustral sediments.

Considering these deposits by themselves, we learn that Lake Lahontan rose to about the level of the lithoid terrace, and then evaporated away to a horizon certainly somewhat lower than the present level of Pyramid Lake. During this evaporation the lithoid tufa was deposited, and evidently owes its precipitation directly to the concentration of the lake waters. The lake was then refilled to the level of the thinolite terrace, where it must have maintained a nearly constant horizon for a long time. Concentration by evaporation continued and the deposition of the crystals after which thinolite is a pseudomorph, took place. From this horizon the lake surface was carried upwards about 220 feet, with many oscillations, and for a long period deposited dendritic tufa. Subsequently the basin was more completely filled, as is shown by the lacustral beds that occur above

DENDRITIC TUFA DEPOSITED ON A CLIFF

the dendritic tufa in the Humboldt and Truckee cañons. During this last rise the water surface reached a horizon about 30 feet above the lithoid terrace, and carved the Lahontan beach—the highest water-line in the basin. From this level the lake evaporated away until the basin reached at least its present condition, and probably a much greater degree of desiccation. We should expect that other deposits of tufa would have been formed during this final evaporation. Thus far, however, there are but few observations to sustain this hypothesis. Smoke Creek Desert and the valley of Pyramid Lake are separated by a low divide, which at a certain stage in the lowering of the lake must have parted the waters in the two valleys. The basin now floored by the desert underwent complete desiccation, and on its surface we find the mineral matter precipitated from the waters as they evaporated. The desert where not concealed beneath recent playa deposits, is covered with an abundance of thinolite crystals, mostly scattered and broken, which, from their position, must have been deposited during the last recession of the waters. The highest point at which this tufa was found may be taken at about 50 feet above the surface of the desert, or a little below the level of the divide at the southern end of the basin. The crystals scattered over the surface of the desert are somewhat different in appearance from the thinolite found in such abundance about Pyramid Lake; and, at their upper limit, pass into a dense, compact, and usually botryoidal mass which closely resembles gray stone-ware. See Fig. 18, Plate XXXIV. As is common with tufa deposits, these crystals are usually grouped about solid nuclei, and frequently form rosette-shaped masses 4 or 5 inches in diameter.

Direct superposition of this variety of tufa upon the dendritic has not been observed; but the sediments on which it rests are probably of the same date as those covering the dendritic tufa in the Truckee and Humboldt cañons. Thinolite crystals of the same character as those scattered over the surface of the Smoke Creek Desert, have been observed at the southern end of Winnemucca Lake, and on the shore of Walker Lake; at the time of their formation, each of these basins must have contained an independent water-body.

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

In the valley of the Humboldt, near Humboldt Lake, a thin deposit of coral-like tufa has been observed coating domes of the dendritic tufa which is quite different from any of the lower tufas occurring in the series.

From their position at the top of the series we refer both of the varieties of tufa described above to the last evaporation of Lake Lahontan. The coral-like form was deposited when the lake filled its basin up to within 100 feet of the Lahontan beach; and the thinolite was crystallized when evaporation had lowered its surface so greatly that it became divided into separate basins, one of which, the Smoke Creek Desert, was completely desiccated.

About Pyramid Lake, where the records of Lahontan history are most complete, these evidences of the last recession of the waters have not been satisfactorily observed. The absence of the second deposit of thinolite in this basin is possibly due to the depth of the waters that occupied it, which did not reach a sufficient degree of concentration to admit of the formation of thinolite crystals, at least not in that portion of the basin now open to inspection. Observation has thus far been unable to show conclusively that coral-like tufa similar to that formed at a recent date in the Humboldt Valley, occurs at other localities, but an outer coating on many of the domes about Pyramid Lake is very similar and is probably of the same date. Its general absence may perhaps be accounted for in many localities by assuming that it would be the first of the tufas to be removed by erosion, after the evaporation of the waters in which it was deposited. Our information regarding the later-formed varieties of tufa is but fragmentary, and does not afford as complete a record of the post-dendritic oscillations of the lake as could be desired.

Carrying our study of tufa deposits one step nearer the present, we find that the rocks and tufa-crags about Pyramid Lake are coated with a thin deposit of calcium carbonate, in the form of compact gray tufa, up to the height of about 12 feet above the level of the lake in 1882. This sheathing also descends beneath the lake surface and, judging from its freshness, it is evident that it is still in process of formation. The similarity between the tufa now forming and the variety first deposited from the waters of Lake Lahontan,

A

B

C

E

IMITATIVE TUFFA FORMS.

indicates that the concentration of the waters of Pyramid Lake at present must approximate that of the ancient lake during its first rise. In sheltered bays among the Needles, where springs with a temperature of about 100° F. rise in shallow water, there are beaches of creamy-white oölitic sand, which, like the calcareous coating on the rocks, is still in process of formation.⁶⁸ The calcium composing the oölitic sand is probably derived from the warm springs near at hand, which are also depositing a light-colored, porous tufa on the lake bottom. In a number of instances, tubular and mushroom-shaped growths occur about the orifices of the submerged springs. Some of these irregular tubes rise 5 or 6 feet above the bottom of the lake, and afford passages for the warm waters that stream through them. It is evident that the precipitation of calcium carbonate commences at this locality at the instant that the warm spring-water comes in contact with the cooler and denser water in which it rises. No chemical examination of these spring waters has been made, but judging from their taste they are practically fresh. The tubular forms produced are high in comparison to their diameter and form miniature towers and domes, which in deep, still water might grow to be of large size. A few of them are represented in Fig. 6, page 61. They assist one in understanding the origin of certain Lahontan tufas, which we shall next consider.

TUFA DEPOSITS IN THE FORM OF TOWERS, DOMES, CASTLES, CRAGS, ETC.

In the foregoing descriptions our attention has been directed to the layers of tufa sheathing the interior of the Lahontan basin. We now turn to other deposits of the same nature occurring in isolated positions at various distances from the borders of the valleys, which we shall call tufa domes, towers, castles, etc., as their forms may suggest. Some of these masses are now wholly or in part submerged beneath the waters of the existing lakes, while others are scattered throughout the desert valleys which were formerly flooded, and frequently resemble isolated watch-towers or crumbling ruins, the origin of which must be a puzzle to one not familiar

⁶⁸The general features of this locality have been noticed in describing Pyramid Lake, page 60.

with the mode of their formation. These tufa-forms occur of all sizes, from mushroom-shaped cakes a few inches high, up to castellated masses rising over a hundred feet above the desert, and frequently contain many thousands of tons of calcium carbonate. Isolated tufa-masses may be studied to advantage about the shores of Pyramid and Winnemucca lakes, and at a few localities on the borders of the Carson Desert. The rugged promontory known as the Needles is surrounded by a number of peculiarly shaped islands which rise from 15 or 20 feet of water to a height of 40 or 50 feet above the lake's surface. The Needles and all the associated islands are composed of tufa, which takes the form of towers and domes of the most rugged and picturesque description. The highest of the Needles rises like a cathedral spire to the height of 300 feet, and is apparently composed of tufa throughout. At the top only lithoid tufa is found; at the base of the spire, where the rock swells out and forms a dome, there is a great thickness of the dendritic variety; at the base, where the rock has been weathered and broken, a heavy deposit of thinolite crystals is exposed, interstratified between the lithoid and the dendritic. The precipitation of calcium carbonate has been so abundant at this locality that the rocky nucleus about which the crystallization commenced can only be seen in a few places.

In some instances tufa domes and towers are grouped in clusters and unite with one another in such a manner as to form castle-like masses of great size, which call to mind the ruins of mediæval strongholds. The appearance of one of these water-built structures standing on the western shore of Pyramid Lake is shown on Plate XL; like all the tufa deposits in the basin that are not submerged, this ancient castle is fast crumbling into decay and ruin.

Isolated towers and shafts of tufa are sometimes seen standing on the desert in independent masses that are frequently 50 or 60 feet high, and furnish most instructive examples of deposits of this nature. These structures are frequently weathered and broken in such a manner as to expose every desirable section of their interiors, and afford abundant opportunity for the study of their anatomy. The inspection of some of these broken shafts shows at a glance that they have a concentric structure, and are composed of three varieties of tufa, as in the case of the deposits sheathing the

with the origin of their formation. These tufa-forms occur of all sizes, from mushroom-shaped cakes a few inches high, up to castellated masses rising over a hundred feet above the desert, and frequently contain many thousands of tons of calcium carbonate. Isolated tufa-masses may be studied to advantage about the shores of Pyramid and Winnemucca lakes, and at a few localities on the borders of the Carson Desert. The rugged promontory known as the Needles is surrounded by a number of peculiarly shaped islands which rise from 15 or 20 feet of water to a height of 40 or 50 feet above the lake's surface. The Needles and all the associated islands are composed of tufa, which takes the form of towers and domes of the most rugged and picturesque description. The highest of the Needles rises like a cathedral spire to the height of 700 feet, and is apparently composed of tufa throughout. At the top only lithoid tufa is found; at the base of the spire, where the rock swells out and forms a dome, there is a great thickness of dendritic variety; at the base, where the rock has been weathered and broken, a heavy deposit of thinolite crystals is exposed, interstratified between the lithoid and the dendritic. The precipitation of calcium carbonate is so abundant at this locality that the rocky nucleus about which the crystallization commenced can only be seen in a few places.

In some instances tufa domes and towers are grouped in clusters and unite with one another in such a manner as to form vast, solid masses of great size, which call to mind the ruins of medieval architecture. The appearance of one of these water-built structures standing on the western shore of Pyramid Lake is shown on Plate XI. The tufa deposits in the basin that are not submerged, this ancient coast is crumbling into decay and ruin.

Isolated towers and shafts of tufa are sometimes scattered in the desert in independent masses that are frequently 50 or 60 feet high, and furnish most instructive examples of deposits of this water-borne nature. These structures are frequently weathered and broken in such a manner that every desirable section of their interiors, and afford an opportunity for the study of their anatomy. The inspection of some of these shafts shows at a glance that they have a concentric structure composed of three varieties of tufa, as in the case of the deposits on the

AN ISLAND OF TUFA IN PYRAMID LAKE, NEVADA.

interior of the basin. A cross-section of one of these columns is shown in the following diagram. The central portion (*a*) is of compact lithoid tufa, which usually exhibits a concentric or tubular structure, and is very frequently from 6 to 10 feet in diameter; surrounding this core is a layer of thinolite crystals, forming the concentric band (*b*), which is commonly from 2 to 6 feet thick; outside of this layer is a coating of dendritic tufa (*c*), of somewhat greater thickness than the thinolite layer, which sheathes the outside of the tower and arches over the low dome forming its summit.

FIG. 29.—Vertical and horizontal sections of a tufa tower.

ot only are these isolated towers composed of distinct layers of the three varieties of tufa we have mentioned, but each of these main divisions is itself banded. The cross-section of some of the tufa towers shows that the inner core of lithoid tufa is composed of as many as fifteen or twenty distinct envelopes; at the center and near the outer margin, some of these bands have a dendritic structure. Sections of the middle or thinolite member reveal that it also is composed of a large number of concentric bands, some formed of large, and some of small crystals; near the outer portion of this deposit thin layers of thinolite alternate with narrow bands of dendritic tufa. The outer sheathing of dendritic tufa is also composed of many layers. Each of these concentric circles seen in the cross-section of a tufa tower, like the annual rings of an exogenous tree, is a section of a cylinder that has been formed about the previous one. It is evident that each concentric band records a change of greater or less importance in the character

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

from which the calcium carbonate was crystallized. The dendritic varieties having a much closer resemblance to each other than either has to the middle or thinolite member; it is apparent that the conditions which favored their deposition, although not identical, were not widely divergent. As the first and third members of the series were deposited when the lake was deep and of broad extent, we may conclude that they were precipitated from comparatively dilute solutions; the middle member, on the other hand, is only found low in the basin, and must consequently have crystallized from waters that were more concentrated.

The structure of the isolated domes, towers, castles, etc., corresponds, in minute detail, with the structure of the tufa layers sheathing the sides of the basin; thus adding strength, if additional evidence were needed, to the conclusion that they were deposited during three well-defined stages in the history of the former lake.

CONDITIONS FAVORING THE DEPOSITION OF TUFAS.

From the facts already gathered concerning the history of Lake Lahontan, it is evident that the principal condition which favored the precipitation of the calcium carbonate dissolved in its waters, was concentration by evaporation; the tributary streams at the same time continuing to supply fresh quantities of calcium carbonate. We do not forget, however, that chemical reactions must have taken place among the various salts as the lake became concentrated, which would affect the nature of the precipitates. The conditions under which a mixture of saline substances exists in solution are too little known, however, to enable one to determine what changes may have taken place.

The conditions favoring the formation of lithoid tufa seem simple in their nature and not difficult to determine. This variety is apparently identical with that precipitated in neighboring Quaternary lakes, and is very similar to the deposits now forming about many springs, or being precipitated from the spray of water-falls, and from the waters of lakes in which evaporation equals or exceeds supply. The deposits now forming owe their deposition to the loss of carbon dioxide, and to evaporation; and are so similar to the first-formed Lahontan tufa, that there seems no doubt but that

J. DALZIEL R.

TUFA TOWERS ON THE SHORE OF PYRAMID LAKE, NEVADA.

the ancient tufa was deposited in a similar manner and was a direct precipitate from lake waters. It is evidently not a pseudomorph, and since its deposition has undergone but slight change.

We have already noted that the dendritic tufa is much more closely related in its structure to the lithoid than it is to the thinolitic variety. The alternation of lithoid and dendritic tufa in narrow bands indicates that the conditions under which they were deposited were very similar. At the time each of these varieties was precipitated the lake was of broader extent and had a much greater depth than when the crystallization of the thinolite took place. From these facts we conclude that the dendritic tufa, like the lithoid, was precipitated when the lake waters were moderately concentrated. At the time of its formation, however, they must have been more highly charged with chloride of sodium, alkaline carbonates, etc., than during the early part of its history. The presence of these salts may account for the peculiar forms assumed by the calcium carbonate upon crystallizing. This variety of tufa, like the lithoid, has remained practically unchanged since it was deposited, and cannot be considered a pseudomorph after any other mineral.

From the relative height of the various tufa deposits on the sides of the Lahontan basin we know that the lake was much lower during the thinolitic stage than when the other varieties of tufa were formed. It was, therefore, presumably a more concentrated chemical solution. This statement requires qualification, however, when we consider that between the lithoid and thinolitic stages the lake sank far below the thinolitic terrace and may have undergone complete desiccation. If the lake was evaporated to dryness at that time, one of three results might have ensued: (a) The precipitated salts might have been buried beneath playa deposits, in which case the lake formed when the basin was partially refilled might have been essentially fresh. (b) The lake might have been partially refilled before any of the precipitated salts were buried, in which case it would be an alkaline and saline solution of the same character as during the low stages previous to desiccation. (c) Lastly, a partial precipitation and burial of the saline content might have occurred; in this case the less soluble salts would have been

leaving the waters in the condition of a mother-liquor, characterized by the presence of the more deliquescent salts. Let us consider the probable effect of each of these conditions on the character of the calcium carbonate subsequently deposited.

If the first case, we should expect that there would be but a slight, if any, deposition of tufa in the rising lake. If precipitation of calcium carbonate did take place, however, it would be expected to have the same characteristics as the tufa formed during the first high-water period, but as the thimolite is markedly different from the lithoid tufa we may disregard this postulate.

If the second were true, and all the precipitated salts were redissolved, the previous condition of the lake would be practically re-established, and the ensuing deposits of tufa could not be expected to differ from that previously precipitated.

If the third were true, a change in the nature of the lake when the basin was partially refilled would result. The first salts to be deposited from a brine obtained by the concentration of waters like those found in the rivers of the Lahontan basin would be calcium carbonate, calcium sulphate, and sodium chloride. As calcium carbonate had already been deposited in immense quantities, and the per cent. of calcium sulphate was probably small, the principal salt that would be precipitated upon a partial crystallization of the substances dissolved in the concentrated lake water would be sodium chloride. If the precipitation and burial of the mineral substances in solution had been stopped at this stage and the basin partially refilled, the resulting lake would have been characterized by the presence of more soluble salts among which the alkaline carbonates would have predominated. The calcium carbonate subsequently contributed by streams and springs as the lake rose would have been precipitated under different conditions than had previously obtained, and this might have caused it to assume a different crystalline form. Thus the postulate of a partial desiccation of the basin agrees best with the facts observed.

As a qualification of the second hypothesis, we might assume, that during the time intervening between the formation of the lithoid and thimolitic tufas concentration was continued for a long period without the depo-

TUFA CASTLE, WEST SHORE OF PYRAMID LAKE, NEVADA

sition of any of the contained salts. The water would thus be more highly charged with saline matter when the lake rose to the level of the thinolite terrace than when it previously stood at that horizon. Under these conditions the composition of total salts would remain practically constant, but their percentage in a given quantity of water would be increased. Our ignorance of the influence that the presence of various salts exerts on the character of the calcium carbonate precipitated from saline waters renders it impossible for us to predict that it would differ in crystalline form when deposited in strong or weak brines. A partial desiccation would cause a more marked change in the chemistry of the lake than continued concentration. We are inclined, therefore, to the belief that the former is the more probable hypothesis of the two.

The positive element in the problem is that a marked change did take place in the character of the calcium carbonate precipitated, which is proof of an alteration in the chemistry of the lake waters, unless the question of temperature be considered as of weight in the problem. The assumption that this change was an increase in the percentage of alkaline carbonates in the waters is strengthened by the fact that thinolite has only been found in this country in basins characterized by the presence of these salts, viz, in the Lahontan and Mono basins. In the Bonneville basin, tufa was deposited on quite an extensive scale, but it did not assume the form of thinolite. Since that basin last overflowed its waters have been concentrated until they are strong brines, without producing the conditions necessary for the formation of thinolite. It is evident, therefore, that some element in the chemistry of the lakes on the western border of the Great Basin, in which they differed from their sister lakes to the eastward, determined the crystalline form of the calcium carbonate precipitated from them. This difference was most probably the greater richness of the western lakes in alkaline carbonates.

It has already been pointed out that lithoid and dendritic tufa must have been deposited from the same solution under slightly varying conditions, for the reason that narrow bands of these varieties alternate with one another. A similar alternation of thinolite and dendritic tufa has been ob-

found in many places, which seems evidence that these varieties were deposited from the same waters under somewhat diverse conditions. A characteristic feature of inclosed lakes is their inconstancy of level. It seems probable that the banded character of the tufa deposits may be correlated with fluctuations of the lakes in which they were formed. In the case under consideration, we may reasonably assume that when the waters were concentrated, thinolite was crystallized; when they became somewhat dilute, the tufa assumed the dendritic form. Finally the lake rose and remained for a long time above the thinolitic limit and only the dendritic variety was deposited. Our observations lead to the conclusion that the changes from conditions favoring the crystallization of thinolite to those admitting of the formation of dendritic tufa or *vice versa*, during certain stages of the lake, were very slight. It appears quite probable that the alternation of thin layers of these varieties of tufa may record alternate arid and humid periods. That they are not annual growths, thinolite being formed during the summer and dendritic tufa during the winter, is evident from the fact that the quantity of calcium in even the thinner layers is too great to have been contributed to the basin within a single year.

Professor Dana's studies have shown that thinolite is a pseudomorph, but what the antecedent mineral may have been still remains an enigma. Geological observations when considered by themselves tend to the hypothesis that the waters in which thinolite was formed were charged with sodium carbonate, and that the crystals now represented by the thinolite were a compound of soda and lime, presumably as the double carbonate. Professor Dana has shown, however, that this postulated mineral could not have been gaylussite (as supposed by King) and, in fact, was not any natural or artificial crystal that has been recognized. It appears as if the unknown mineral must have been produced by a delicate adjustment of the chemical conditions of lake waters—in which the influence of the mass and of temperature perhaps played an important part—which has not been observed in nature or reproduced in the laboratory. In reference to the chemical nature of the original mineral Professor Dana says:

"The description of the original crystalline form of the thinolite, so far as it can be made out, is sufficiently complete to give an emphatic neg-

TUFA DOMES IN PYRAMID LAKE, NEVADA.

ative answer to the question as to the nature of the original mineral. It was *not* gaylussite, nor gypsum, nor anhydrite, nor celestite, nor glauberite, nor, in fact, any one of the minerals which might suggest itself as a solution of the problem. The crystalline form is totally irreconcilable with any of these. This is so clear, from what has gone before, that the question admits of no argument at all. But more can be said: the original mineral was one which does not appear thus far to have been observed in its natural condition, although, as will be shown later, it probably has occurred abundantly at numerous other localities. Furthermore, a review of all the artificial salts of calcium, sodium, and magnesium has failed to bring to light any one which would satisfy the conditions required.

"It seems, therefore, that any explanation of the original condition of the thinolite beds of Lake Lahontan must at present rest on hypothetical grounds, and much as a definite solution of the problem is to be desired, it is not now attainable. A few suggestions may not be out of place here, The open skeleton forms, consisting now of crystallized calcium carbonate, make it seem very probable that the original mineral was a double salt, and that a salt containing calcium carbonate as one of its members. Only on such a supposition is it easy to understand the removal of so large a part of the original material and the leaving behind of these plates of calcium carbonate, marking the original crystalline structure. Whether the original crystals were or were not solid throughout, at the time of their formation, it is not possible to say now with certainty; very probably they varied much at different points in this respect. From the analogy of soluble salt deposited rapidly from aqueous solutions, it seems likely that open, cavernous forms were common, perhaps the rule. But even supposing this to be true, no one can inspect such groups of skeleton crystals as those from the Marble Buttes without seeing that what now remains is only a part of what originally crystallized out of the saline waters of Lake Lahontan. This fact, coupled with the other just mentioned, that the remaining skeleton consists of crystallized calcite in granular form, gives, a very important hint as to the changes which these crystalline beds have undergone. The successive steps may have been as

GEOLOGICAL HISTORY OF LAKE LAHONTAN.

(1) The deposition of crystals as the lake waters evaporated; (2) a change of conditions, *e. g.*, an addition of fresh water to the lake (as suggested by King), leading to the solution of a part of the substance of the crystals and the simultaneous recrystallization of the remaining calcium carbonate; (3) the subsequent and independent deposition of the carbonate, solidifying and coating over the skeleton forms.⁶⁹ The conclusion reached by Mr. King, that the original mineral was gaylussite, satisfies the requirements tolerably well, for it is then necessary only to explain the presence of the sodium carbonate, and the calcium carbonate remains behind. Unfortunately for this hypothesis, it is impossible to reconcile the forms which now remain, showing how the original mineral crystallized with the monoclinic forms of gaylussite.⁷⁰ Furthermore, Mr. Russell finds several other grounds, independent of this crystallographic proof, for the belief that the supposed enormous deposit of gaylussite could not have taken place. But if not gaylussite, what was the original mineral?

"It is hardly profitable to go beyond the above suggestion, that it may have been a double salt, containing CaCO_3 , unless the hypothesis can be based upon some observed facts; but fortunately some facts can be pointed to which lead to a possible explanation of the enigma, and which are in any case very suggestive.

The only crystalline forms bearing any close resemblance to the acute tetragonal pyramids of the thinolite, of which the writer has any knowledge, are those of the *pseudomorphs of lead carbonate after phosgenite*, first described by Krug von Nidda,⁷¹ from the zinc mines in Upper Silesia. This similarity in habit and angle is the more striking, as the thinolite form is an

⁶⁹ U. S. Geological Exploration of the Fortieth Parallel, Vol. I, p. 517.

⁷⁰ At the time when Mr. King had this subject under investigation he submitted several specimens to the writer for inspection, and he then gave a qualified assent to the conclusion Mr. King had reached in regard to them. One of these specimens, as Mr. King had noted, showed some crystals which bore a remarkably close resemblance to the well-known Sangerhausen pseudomorphs, then generally referred to gaylussite. This similarity suggested identity of origin—a conclusion which (after a further study of the same specimen) the present investigation has confirmed, as noted below—and thus gave apparent support to the gaylussite hypothesis. The other specimens then in hand were somewhat like Fig. 1, on Plate XXXIII, and upon the inspection given them—no opportunity was had for careful study—they gave negative results; a certain outward similarity to the elongated crystals of gaylussite from South America (called *clavos*, nails) was noted, but nothing more definite.

⁷¹ Krug von Nidda: Ueber das Vorkommen des Hornbleierzses und des Weissbleierzses in den Krystallformen des ersteren in Oberschlesien, Zeitsch. geol. Gesellsch., II, 126, 1850. See also Blum, Pseudomorphosen, Zweiter Nachtrag, 68.

TUFA TOWER ON THE SHORE OF WINNEMUCCA LAKE, NEVADA.

unusual one. A number of these pseudomorphs are in the Blum collection, which became the property of the Yale Mineralogical Museum in 1872. They correspond to the description given by Krug von Nidda. They have the form of a square prism, sometimes terminated by a pyramid having an angle over the extremity of about 36° , and occasionally show traces of an octagonal pyramid; other forms show only a very acute square octahedron, with a summit angle of about 13° in one case and 26° in another. One specimen shows these forms imbedded in a white clay. They are now completely altered to compact, fine-granular lead carbonate, except for the presence of an occasional minute nucleus of the original mineral.

“The hypothesis to which this resemblance leads is this: that *the original mineral may have been chloro-carbonate of calcium isomorphous with phosgenite*; that is, a mineral having the composition $\text{CaCO}_3 + \text{CaCl}_2$ isomorphous with $\text{PbCO}_3 + \text{PbCl}_2$, and now altered to CaCO_3 , as in the phosgenite to PbCO_3 . The hypothesis, as far as the crystallographic relations are concerned, is a most natural one. The difficulty arises when we consider the peculiar nature of calcium chloride, and hence question whether an anhydrous molecular compound of calcium carbonate and calcium chloride could have been deposited from the waters of Lake Lahontan. Obviously this is a subject for synthetic experiment, and whatever the nature of the original mineral, it ought to be possible to approximate to the conditions under which it was made and so to reproduce it. It is to be hoped that the work now being carried forward by the chemists of the Geological Survey may lead to some decisive results in this direction.

“In the meantime it is interesting to note the only case in which, so far as the writer can ascertain, a chloro-carbonate of calcium has been formed. The experiments are described by Fritzsche in the Bulletin of the St. Petersburg Academy for 1861, and reprinted in the Journal für praktische Chemie.⁷² He states that on evaporating the solution of crystallized calcium chloride, prepared in large quantities for technical purposes, there remained a small amount of a sandy powder, which kept a yellowish aspect so long as the calcium chloride solution was concentrated, but in a dilute

⁷² J. Fritzsche: Ueber ein Doppelsalz aus kohlensaurem Kalk und chlorcalcium. Jour. prakt. Chem., LXXXIII, 216, 1861.

solution became finally white. When some of the crystals were placed on a glass slide under the microscope, and then water poured upon them, it was observed that they for a moment were completely transparent and underwent no change; soon, however, the surface became clouded, and then a granular separation took place gradually. As the CaCl_2 was dissolved they entirely lost their transparency, and finally there remained *only a skeleton of calcium carbonate corresponding in form and size to the original crystal*. These fell to pieces when touched, and there resulted minute spherical masses of probably amorphous carbonate. This salt was found to have the composition $2\text{CaCO}_3 + \text{CaCl}_2 + 6\text{H}_2\text{O}$. The crystals were shown by v. Kokscharof to belong either to the orthorhombic or monoclinic system. It is not to be supposed that this salt of Fritzsche is in any way an explanation of the thinolite enigma, and yet his observations are of great interest in this connection. In order to complete the subject the fact may be noted that Berthier speaks of forming a compound of calcium-carbonate and chloride by fusion.

“Another hypothesis may be offered as to the composition of the original mineral, viz: that it was a double salt of calcium and sodium, perhaps conforming to the formula $\text{CaCO}_3 + \text{NaCl}$, or better $\text{CaCO}_3 + 2\text{NaCl}$, which, it is possible, might also be isomorphous with phosgenite. This is so purely hypothetical that very little weight can be given to it; still it may not be entirely useless to throw out the suggestion, although various serious objections at once come up to mind. In any case it must be borne in mind that carbonates and chlorides were the salts most likely to be precipitated from the lake water, and calcium and sodium were the prominent basic elements at hand.”

The crystals deposited on such an enormous scale in Lake Lahontan are considered by Professor Dana as being of the same nature as the well known Sangerhausen pseudomorphs. Similar crystals have also been found at other localities, but for the discussion of these mineralogical relations we must refer the reader to Professor Dana's report, where these matters are considered at some length.

Throughout the Lahontan basin the various deposits of tufa are most abundant on steep rocky slopes and on isolated buttes which were formerly submerged. Its exceptional abundance at these localities is due principally to the fact that the rocky surface afforded stable support for the precipitates deposited upon them; and its preservation is insured because precipitous shores are in general only slightly modified by wave action, and are not favorable to sedimentation. The dash of the waves against sea cliffs may also promote precipitation for the reason that the waters are aerated, thus facilitating the escape of carbon dioxide, the presence of which is necessary to the solution of calcium carbonate. Wherever tufa occurs on the surface of lake beds a solid nucleus may nearly always be found about which the calcium carbonate was deposited. Pebbles and shells lying on the bottom, or rocky points projecting above the mud, were favorable nuclei around which crystallization took place. About such centers mushroom-shaped growths were formed like those shown on Plate XXXVII, or domes and castles of great size were slowly built up. Solid nuclei seem essential for the commencement of these imitative structures, and appear to play the same role as the nuclei in the familiar experiments of crystallizing alum and rock candy. Some of the towers and castles in the Lahontan basin, which contain hundreds and even thousands of tons of tufa, are known to spring from small centers of accretion. When crystallization was once initiated, precipitation appears to have been accelerated and may possibly have been continued in waters that were below the point of saturation. When the crystallization began about a small nucleus at the bottom of the lake the tendency was to build upwards. Owing to this tendency the tufa deposited in isolated localities assumed the form of domes and towers instead of spreading out laterally and forming sheets or thin flat-topped masses.

The fact that calcium carbonate cannot remain in solution in concentrated lake waters, but is precipitated as soon as delivered by tributary streams, indicates that tufa is a deposit of moderately saline waters. In Great Salt Lake little more than a trace of calcium is found, and this probably exists as the sulphate. In Mono Lake about six hundredths of one per cent. has been found by analyses. The dense alkaline waters of the Soda Lakes near Ragtown, and of Abert Lake, Oregon, are free from cal-

cium; yet all of these lakes are fed by waters that hold about the normal amount (0.0088 per cent.) of calcium carbonate found in river waters. When streams and springs enter these highly concentrated lakes, the calcium carbonate they hold in solution is at once precipitated, either in an amorphous or a crystalline condition, and accumulates at the bottom in the form of marl or, in some instances, as oolitic sand. In order that tufa may be deposited about the borders of a large lake it is evident that the calcium carbonate must remain in solution for a considerable time so that it may be carried to distant parts of the lake; hence the lake waters cannot be highly concentrated or else the calcium would be precipitated before reaching points situated at a distance from the mouths of the inflowing streams. From observation we learn that compact lithoid tufa is now being deposited in Pyramid and Walker lakes, which contain about three-tenths of one per cent. of total solids in solution. In the more highly concentrated lakes mentioned in this paragraph, no deposits of tufa have been observed in process of formation. This evidently indicates that a lake in which heavy deposits of calcium carbonate were accumulated could not have been a concentrated solution during the tufa-forming stages. The deposition of marl in lakes of concentrated water has not been observed, but it appears probable that the highly calcareous beds found in the sediments of some of the Quaternary lakes of the Great Basin were precipitated from saline waters. The precise chemical conditions which determine whether the calcium carbonate precipitated from lake waters shall be incoherent and form marl, or whether it shall crystallize on coming in contact with foreign bodies or previously formed crystals has not been determined. Questions of this character are in a great measure beyond laboratory experiment for the reason that large bodies must be dealt with in order to reproduce the conditions of nature.

That the shells of mollusks occur in thousands in both the lithoid and the dendritic tufa, is also proof that the waters of Lake Lahontan were only moderately concentrated at the time these deposits were formed. No traces of fossils have been found in the thinolite crystals.

When springs rise in the bottom of a lake a new element is introduced into its chemical history. Sublacustral springs, charged with carbon dioxide

and calcium carbonate, upon mingling with the waters of a lake may part with their dissolved gases and deposit calcareous tufa. Again, the waters of a lake may be such a strong brine that calcium carbonate cannot be retained in solution, as is the case with Great Salt Lake at the present time. In such an instance the calcium carbonate contributed by springs would be precipitated when their waters mingled with those of the lake. Phenomena of this nature have been observed at the Needles, as described on page 61, and may be studied at a number of localities in Mono Lake. This lake, as shown by the analyses given on table C, is a strong solution of the carbonate and the sulphate of soda, chloride of sodium, etc., while many of the springs that rise in it are quite remarkable for their purity, but yet contain a small percentage of calcium carbonate which is deposited about their points of discharge. These accumulations frequently form domes of large size that are porous and tubular in structure, and in many respects resemble those standing in the deserts of the Lahontan basin. In numerous instances the deposits from the springs in Mono Lake form irregular tubes that are clustered together and frequently branch and expand as they grow upwards, thus forming columnar and vase-shaped structures. A most instructive exhibit of this nature is to be seen in the western portion of Mono Lake, near the mouth of Mill Creek. At this locality, a part of which is shown in Plate XLIII, there are as many as fifty or sixty tufa domes standing in from twelve to fifteen feet of water, many of which rise from ten to twelve feet above the surface of the lake. The tops of some of these structures are occupied by basin-shaped depressions, which in a few instances, are filled with water that rises through the irregular tubes and open spaces in the column beneath. The water in these basins is cool and fresh, and overflowing, fountain-like, down the sides of the vases, mingles with the waters of the lake. These structures are still growing by the gradual precipitation of calcium carbonate, which is taking place, however, only above the lake surface. They are nearly always considerably smaller at the lake surface than at the top, and in general form are not unlike the sponges known as Neptune's cups, found in southern seas. They are not only striking examples of chemically formed rocks that are of interest to the geologist, but they are fountains of sweet water in the midst of a lake that is utterly

unfit for drinking. In some instances tufa towers ten or twelve feet in diameter, perhaps occurring in clusters, rise twenty or thirty feet above the bottom where soundings show the water to be forty feet deep. From a boat these structures may be clearly seen when sailing over their submerged summits. At times springs rush upward from openings in the tops with such force that their presence is distinctly marked at the surface by a low dome of water.

The formation of tufa finds many illustrations in the Mono basin which will be described more completely in a future report. Only a few examples are mentioned here as supplementing those observed in the Lahontan basin. On the southern shore of Mono Lake, near the Mono Craters, there is an area several acres in extent, bordering the lake, that is covered with thousands of slender tubular columns of tufa from a few inches to three or four feet in height. These are porous and tubular in structure, and must have been built up by the deposition of calcium carbonate from the waters that once rose through them. When the orifice at the top of a column became closed other openings were formed at the side, thus causing the structure to become irregular and sometimes branching. This strange forest of contorted tufa trunks was formed by springs beneath the surface of the lake when it stood at a higher level than at present, and has been left exposed by a recession of the waters.

The similarity in structure between the tufa deposits formed about sublacustral springs in Mono Lake, and the inner core of lithoid tufa in many of the tufa towers now standing in the desiccated basin of Lake Lahontan, is sufficient indication that many of the latter were deposited in a like manner. This explanation, however, cannot be extended to the coatings of thinolite and dendritic tufa enveloping the cores of lithoid. From our present knowledge we may conclude that there are at least two ways in which tufa towers may originate. First, by the direct precipitation of calcareous tufa about nuclei. Second, from the precipitation of the same material from springs rising in lakes that are highly charged with mineral matter in solution.

SECTION 3.—DESICCATION PRODUCTS.

During the centuries that witnessed the deposition of the vast amount of calcareous tufa now found in the Lahontan basin, other salts were contributed to the lake in varying proportions. Upon the evaporation of the waters these more soluble salts were eventually deposited, and, as the lake never overflowed, they must still be retained in the basin.

Instances of the deposition of salts by the evaporation of inclosed lakes are common, and may be illustrated by many examples in the Great Basin. The salt fields in Osobb Valley; the saline deposits left by the evaporation of the Middle Lake in Surprise Valley, California, in 1872; and by the broad salt field now covering the desiccated basin of Sevier Lake in Utah, are all cases in point.

In the Lahontan basin, deposits of this character, which have resulted directly from the evaporation of the former lake are nowhere to be found. The accumulations of common salt, sulphate of soda, etc., occurring in considerable quantities at certain localities, have in all cases been deposited since the evaporation of the former lake. In some instances these accumulations are due to the leaching of saline clays, and the evaporation of the resultant brine in restricted areas, as in the case of the salt fields in Alkali Valley; at other times saline deposits of considerable thickness have resulted from the evaporation of spring waters. Over very large areas the Lahontan beds are frequently whitened with a saline efflorescence, which also owes its accumulation to secondary causes, as will be described a few pages in advance.

Wherever the Lahontan sediments have been examined they have been found more or less highly charged with salts of the same character as those that were most common in the waters of the former lake. The total quantity of saline matter thus imprisoned is certainly very great, and is assumed to represent the more soluble substances contributed to Lake Lahontan.

THE FRESHENING OF LAKES BY DESICCATION.

The apparently anomalous phenomena of the desiccation of a great lake without leaving a surface deposit of salt, seems explicable in only one way. Adopting the suggestion advanced by Mr. Gilbert in explanation of some portion of the history of Lake Bonneville, the absence of saline deposits is accounted for by the hypothesis that they were buried and absorbed by lacustral clays and playa deposits during periods of desiccation.

The freshening of a lake by desiccation may be illustrated in all its stages in the various basins that have been examined in the Far West. A lake after a long period of concentration becomes strongly saline, and finally evaporates to dryness, leaving a deposit of various salts over its bed. During the rainy season the bottom of the basin is converted into a shallow lake of brine which deposits a layer of sediment; on evaporating to dryness, during the succeeding arid season, a stratum of salt is deposited which is, in its turn, covered by sediment during the succeeding rainy season. This process taking place year after year results in the formation of a stratified deposit consisting of salts and saline clays in alternating layers. The saline deposits may thus become more and more earthy until the entire annual accumulation consists of clays. The site of the former lake then becomes a playa. A return of humid conditions would refill a basin of this character, and might form a fresh-water lake, the bottom of which would be the level surface of the submerged playa.

The larger lakes of the Lahontan basin, as well as a number of less importance in eastern Nevada and southern Oregon, are without outlet. They occur in basins that in almost all cases were occupied by much larger water-bodies during the Quaternary, which, like their modern representatives, never overflowed. From the long period of evaporation that has taken place, one would expect the existing lakes to be dense mother-liquors. The fact is, however, that they are but slightly charged with saline matter, and in some instances are sweet to the taste and sufficiently fresh for all culinary purposes. In many localities the lacustral beds surrounding and underlying the present lakes are highly charged with soda salts, which rise to the surface during the dry season as efflorescences.

As these lake basins were never filled to overflowing, we are forced to conclude that influx was counterbalanced solely by evaporation, and that during periods of extreme desiccation the saline deposits became buried and absorbed by the marls and clays which accumulated in the valleys.

Having analyses of the waters of an inclosed lake, and knowing also the composition of its tributaries, we can determine, at least approximately, the length of time it has been in existence, provided no salts previously deposited were dissolved when the basin commenced to fill. For the purpose of making a computation of this nature in the case of the lakes now occurring in the Lahontan basin, the following table has been compiled from analyses given in chapter III.

TABLE D.—Composition of the principal lakes and rivers of the Lahontan basin.

Commencing with the simplest instance, we have in the case of Walker Lake an inclosed water-body which receives its entire supply from the Walker River. The total quantity of saline matter contained in the lake water is 13.89 times as great as in an equal volume of river water. It follows, therefore, that nearly fourteen times the present volume of Walker Lake has been evaporated in order to bring the waters to their present degree of salinity. If we know the average annual influx, we can determine the length of time required to bring the lake to its present density. From the very few measurements available, we have assumed 200 cubic feet per second, or 700,000,000 cubic yards per annum, as the average discharge of the Walker River at the present time (see page 44). The volume of the lake, as determined from the data given on Plate XV, is 13,159,000,000 cubic yards. It would therefore require between eighteen and nineteen years for the river to supply water enough to fill the lake basin to its present extent. As the total saline content of the lake amounts to about fourteen times what would be contained in an equal bulk of river water, it would require 260 years for the river, with its present volume, to supply the amount of saline matter now dissolved in the lake, provided there had been no loss of the salts contributed. Observations have shown, however, that calcium carbonate is being deposited from the waters of the lake. A comparison of the analyses of the lake and river waters given on pages 46 and 70, shows that there is even less of this salt in the lake than in an equal volume of the river water. All of the calcium now contributed is apparently at once precipitated. The remaining salts occurring in the lake are more soluble than calcium carbonate, and we have no reason to suppose that any of them are being precipitated. Dropping calcium carbonate from the analyses, and considering the remaining salts only, we learn that in these the lake is 19.66 times as rich as the river waters. Making the computation as before, but using the last mentioned value for the relative salinity of the lake and river, we find that it would require 343 years for the river to supply the amount of salt now contained in the lake.

Approaching the question in another manner, it is evident that we may determine the annual inflow, providing the annual evaporation is known,

for the reason that the inflow and the evaporation now counterbalance each other. There are no observations on the rate of evaporation in this region, but in a similar calculation relating to Great Salt Lake, Mr. Gilbert, after considering all the data available, has assumed 6 feet per annum as the loss by evaporation. In the comparatively fresh waters of Walker Lake the rate of evaporation under the same atmospheric conditions must be considerably greater than in the nearly saturated brine of the Utah Lake. In order not to overestimate, however, we will assume the same rate of evaporation in Walker Lake that has been adopted in the case of Great Salt Lake, viz., 6 feet per annum. The area of the lake is 118 square miles, or 365,516,800 square yards; an annual loss of 6 feet by evaporation gives 731,000,000 cubic yards as the total annual evaporation. This estimate was made independently of the former, but the data in each case are necessarily indefinite, and the close approximation in results is not an indication of accuracy.

The average depth of Walker Lake is 118 feet, and as the waters are 19.66 times as saline as those of the river, omitting calcium carbonate from each, it would evidently require the evaporation of a lake of fresh water of the present size and 2,320 feet deep to produce the amount of saline matter now held in the lake. Evaporation taking place at the rate of 6 feet per year, it would require 370 years to reduce this hypothetical lake to the present volume of Walker Lake. Before drawing any conclusions as to the length of time that the present lakes of the Lahontan basin have existed, we may make a more general calculation of the same nature as the above.

Let us suppose the three principal lakes of the Lahontan basin united, and supplied by the three rivers of which we have analyses, viz., the Humboldt, the Truckee, and the Walker. We should have a lake 1,300 square miles in area, with an average depth of 117 feet, and containing 26.71 times the percentage of salt held by the average of the tributary streams, not including CaCO_3 . To obtain a water-body of this degree of salinity from the concentration of the river-waters would require the evaporation of a lake of the area of the assumed one and 3,125 feet deep. Evaporation taking place at the rate of six feet per year, it would require 521 years for the waters to be condensed to the degree represented by the present lakes. This estimate

has been made without considering the amount of saline matter brought into the lakes by springs; and assumes that no salts remained in the basin when the process began. We know, however, that very large quantities of various salts are contributed to the lakes of the Lahontan basin from subterranean sources. Any conclusion derived from the above considerations must be weighted by the fact that the analysis of the rivers were in all cases of samples collected outside the old lake basin, and therefore not affected by the substances derived from the richly saline clays and marls of Lahontan date, through which they carved channels sometimes a hundred miles in length before reaching the lakes into which they empty. The present lakes also derive large quantities of foreign matter from the temporary rills that are formed after the infrequent storms and are charged with the salts derived from the efflorescences formed on the surrounding desert surfaces during the arid season. It is true that the data we have used for computing the flow of the rivers as well as for obtaining the average annual evaporation are based upon very incomplete observations, but we feel confident that future study will show these estimates to be below rather than above the reality. With all these considerations in view, it seems evident from the calculations we have made, that the lakes of the Lahontan basin could not have existed under the present conditions for more than a few centuries at the most without being far more saline and alkaline than we now find them. From the hypothesis of the freshening of lakes by desiccation we conclude that the basin of Lake Lahontan was completely desiccated for a period, ending, we will say, about three hundred years ago, which was sufficiently long to allow of the burial of any saline deposits that may have been left from the evaporation of previous water-bodies in the same basin. By complete desiccation we mean that the various secondary basins formerly flooded by Lake Lahontan became sufficiently dry during successive years, or at intervals of a number of years, to admit of the formation of playa-lakes and playas, and the burial and absorption of saline matter beneath playa deposits. That this was the actual condition of the various valleys composing the Lahontan basin at no distant date is rendered still more probable by the fact that the bottoms of all the lakes of the region

are level-floored, and have the same general contour as many neighboring valleys which are occupied by playas.⁷³

Applying this line of argument to all the inclosed lakes of the Great Basin, we find, with the exception of Great Salt and Sevier Lakes—the Soda lakes near Ragtown, Nevada, and Mono Lake, not being considered, as they are of an exceptional character—that there is not a lake among the number that could have undergone the present rate of concentration for more than a very few centuries without being far more saline than we now find it. By consulting Table C, it will be seen that with the exceptions we have mentioned there is not a lake in the arid region of the West that contains more than one-fiftieth of the quantity of the more common salts necessary for saturation. This appears to be *prima facie* evidence that these lakes have undergone some process by which their salts have been eliminated within very recent times. In the case of Great Salt Lake we find an exception not only in the amount of saline matter it holds in solution, but also in its environment. With this exception, all the lakes of the Great Basin occupy narrow valleys in which a lake on evaporating would deposit its salts in a comparatively restricted area, thus favoring their burial by playa deposits. The basin of Great Salt Lake, on the other hand, is not only of broad extent, but receives its entire water supply from one side, and is thus unfavorable in its topographical relations for the burial of products of desiccation beneath playa deposits. The present density of this lake may therefore be due to the fact that its salts were not buried during a time of desiccation which admitted of this result in smaller basins; consequently, when the valleys were reflooded, the lakes in the smaller basins were fresh, while in the larger one the unburied saline deposits left by the evaporation of the former lake were redissolved.

The order in which a number of inclosed lakes in an arid region like the Great Basin, will become dry during a time of more than usual desiccation, depends on many conditions; one of the most important of which is the ratio of evaporating surface to elevated catchment basin. A lake whose hydrographic basin is low will be extremely sensitive to climatic

⁷³A comparison of the lake basins of the Lahontan region with the depressions holding the Laurentian lakes, shows that the bottoms of the former are more nearly horizontal and far more regular than those of the latter.

oscillations; while one receiving the drainage from a lofty mountain range may be but slightly lowered by a climatic change that would produce desiccation in a neighboring valley. From this and other allied reasons, Great Salt Lake may not have been evaporated to dryness during the time that the lakes of western Nevada completely disappeared.

The only analysis we have of the waters of Sevier Lake gives 8.64 per cent. as the total of saline matter in solution. The sample analyzed was collected in 1872; ten years later the lake was almost completely desiccated, and its site converted into a field of salt. We have classed this as a playa lake, and do not consider it of importance in the present discussion, as it not only varies greatly in salinity, owing to variations in volume, but is also so situated that it receives the drainage of a broad desert and must receive large quantities of saline matter from the efflorescences formed each year on the neighboring land surface.

A comparison of the molluscan life of Pyramid and Walker lakes with Lahontan fossils indicates that a marked change has taken place in the fauna of the basin since the last high-water stage of the old lake. This question is considered in the chapter devoted to the life history of Lake Lahontan.

SECTION 4.—EFFLORESCENCES.

In the preceding pages we have had occasion to speak of the saline incrustations, or efflorescences, to be seen over large areas in the Lahontan basin. It is now our purpose to describe these accumulations more fully. They originate in the saline lacustral clays which floor all the valleys once occupied by the ancient lake, and usually occur in greatest abundance on the borders of the larger deserts, where they not uncommonly whiten the surface over many square miles. In tracing their distribution it is noticeable that they occur most abundantly in those portions of the valleys that are underlaid by the clays deposited directly from suspension in the ancient lake, but are not found on the surfaces of many of the more modern playas which occupy the lowest depressions in the various basins, thus showing that the recently formed playa-beds are in many instances less saline than the true lacustral clays.

The genesis of the efflorescent salts that appear on desert surfaces is not difficult to explain. During the rainy season the clays become saturated with moisture, but on the advance of summer they dry at the surface at the same time that moisture rises from below through the action of capillary attraction. The waters saturating the beds are rendered saline by the salts they dissolve from the clays, and on evaporating at the surface deposit all foreign matter as a surface incrustation. The incrustations thus formed are frequently five or six inches in thickness. They frequently dissolve and disappear during the winter, only to reappear when the heat of summer dissipates every drop of moisture from the surface of the deserts.

From the manner in which saline efflorescences are formed, it is evident that they give a very fair indication of the character of the more soluble salts impregnating the lacustral beds which floor the valleys. The analyses inserted below are of representative samples gathered on the surface of the deserts at widely separated points in the Lahontan basin, and may be taken as indicating approximately the relative abundance of the more soluble salts in the sediments of the ancient lake. Local variations occur, but in general they consist mainly of the more common salts of soda, as has been shown by qualitative tests of a large number of samples in addition to the quantitative analyses here introduced,⁷⁴ which were made by Dr. T. M. Chatard. Sample No. 1 is from the surface of the desert, a few miles north of the northern end of Walker Lake. No. 2 is from near Black Rock Point in the Black Rock Desert. Efflorescent incrustations are nearly always mingled with portions of the sand and clay on which they rest, but in the following analyses only the portion soluble in water is considered:

Constituents.	No. 1.	No. 2.
	<i>Per cent.</i>	<i>Per cent.</i>
Silica (Si ₂ O)	1.96	2.18
Potassium chloride (KCl)	1.18	1.39
Sodium chloride (NaCl)	2.53	59.32
Sodium borate (Na ₂ B ₄ O ₇)	4.15	1.00
Sodium sulphate (Na ₂ SO ₄)	17.49	27.05
Sodium carbonate (NaCO ₃)	72.69	9.06
	100.00	100.00

⁷⁴ See also Reports of U. S. Geological Exploration of the Fortieth Parallel, Vol. I, Table of chemical analyses, No. V.

The total quantity of saline matter occurring as an efflorescence on the deserts of the Lahontan basin would be found very great could it be reckoned in tons. At many places it is of economic importance for the common salt, sodium carbonate, boracic acid, etc., that it contains. The industries arising from the commercial value of these deposits, although limited at the present time, may be increased, at least so far as the gathering of common salt is concerned, almost without limit, the supply in many localities being far beyond any demands that are likely to be made upon them.

A good illustration of the nature of the salts impregnating the Lahontan sediments is furnished by an examination of the various salt-works located within the lake basin.

BUFFALO SPRINGS SALT WORKS.

At the Buffalo Springs Salt Works, situated on the west side of Smoky Creek Desert, the brine from beneath the desert is allowed to collect in wells, and is then pumped into vats at the surface and left to evaporate. The crust of salt that remains is then gathered and is found sufficiently pure for all domestic uses. About 250 tons are annually collected, the total amount produced since the works were started being not far from 1,500 tons. When fresh water is caused to flow over the surface of lake-beds in the vicinity it soon becomes strongly saline, and when it gathers in hollows and evaporates it leaves a crust of salt that is sometimes several inches in thickness. This method is employed, to some extent, for obtaining the less pure grades used principally for chloridizing silver ores.

Two miles east of the works there are level, pond-like areas on the surface of the desert that are usually covered with a white efflorescence some inches in thickness. Other depressions are soft and completely saturated with bitter brine. In some, there are deposits of sulphate of soda at least several feet in thickness, but never probed to the bottom. When examined by the writer, these sulphate beds were covered to the depth of several inches with mother-liquor or soft mud that rendered the surface unsafe to walk upon. The whole desert region, on the edge of which the

Buffalo Salt Works are situated, is one vast stretch of yellowish mud, without vegetation, impassable except during the dry season, and locally known as the "mud lakes." The salt obtained from the wells of the salt works and the sulphate of soda, and other minerals found on the surface near at hand, are all derived from the salts impregnating the Lahontan Lake beds.

The brine from the wells has been analyzed by Mr. F. W. Taylor, of the National Museum, with the following result:

Specific gravity, 1.1330.	
Silica in solution	trace
Calcium sulphate	0.1467
Magnesium sulphate.....	.8833
Potassium sulphate	.3111
Sodium sulphate	.5306
Sodium chloride.....	14.8383
Water	83.2900
	100.0000

EAGLE SALT WORKS.

Another locality favorable for the study of the desiccation products of Lake Lahontan is at the Eagle Salt Works, situated near the Central Pacific Railroad, about 18 miles east of Wadsworth. The long valley in which they lie was a strait during the higher stage of Lake Lahontan. When the water fell about 100 feet the region where the salt is now found became a bay, connected with the Carson division of the lake through the Ragtown Pass. The country about the works is a desert mud plain, much of which is covered during the summer by a white saline efflorescence. The method here employed for obtaining the salt is to dissolve the crust that is formed on the surface of the desert and allow the saturated water to gather in shallow vats and evaporate. The water from springs on the eastern edge of the plain is conducted over the surface of the lake-beds, and made to flood small areas inclosed by low dams or ridges of clay. From the flooded areas it soaks through the clay ridges and enters shallow vats dug in the lake-beds on either side, where it evaporates and deposits its salts. The areas inclosed by clay ridges and flooded by the fresh water are called "reservoirs" by the workmen, and the long troughs between them, where the brine evap-

orates, are known as "vats." These are arranged alternately and may be multiplied to any extent. A profile through a reservoir and the vats on either hand is shown in the diagram.

FIG. 30.—Section of reservoir and vats at Eagle Salt Works, Nevada.

The lake deposit here is a fine greenish mud or clay, and is so completely saturated with brine that a thick crust is formed on the surface by efflorescence every dry season. The salt, being supplied from the beds below the surface, is renewed every summer, thus allowing a series of crops to be gathered from the same ground.

A sample of brine from a vat in which the salt had begun to crystallize was analyzed by Mr. Taylor, with the following result:

Specific gravity, 1.2115.	
Silica (insoluble)	.0028
Iron and alumina (insoluble).....	.0004
Calcium sulphate.....	.2897
Calcium chloride	.3578
Magnesium chloride	.3787
Potassium chloride	.0023
Sodium chloride.....	25.3793
Water.....	73.5890
	100.0000

The annual yield of salt during the past ten years is reported to have been about 2,500 tons. The production has been determined solely by the demand. The amount that could be collected by the simple process of leaching the saline lake-beds and evaporating the saturated waters is practically without limit.

SAND SPRING SALT WORKS.

The most instructive salt field in the Lahontan basin is situated at the eastern end of a long, barren valley, joined to the Carson desert on the southeast by a narrow pass, and known as Alkali Valley. The floor of this valley, when left dry by the evaporation of Lake Lahontan, had the same general level as the Carson desert, and the lake-beds may be traced through the pass from one desert to the other. In riding from the Carson desert eastward into Alkali Valley, one comes to a line crossing Alkali Valley from

north to south, beyond which the surface of the desert has a gentle inclination eastward. The surface of the lake-beds when first deposited was horizontal, and the present inclination is due to a fault crossing the valley with a north and south strike, and to the tilting of the orographic block on which the eastern portion of the valley is situated. The tilting of the floor of the valley resulted in the establishment of a drainage to the eastward for the surface waters, and the formation of a small lake at the eastern end of the valley near Sand Springs. During the winter the water collects there, forming a sheet of brine of variable size, sometimes covering 10 or 15 square miles of surface, but with a depth of only a few inches. In the summer the water evaporates and adds to the layers of salt previously deposited.

The deposit of salt thus accumulated is from 3 to 5 inches thick near the margins, and is said to have a depth in the central portion of the basin of not less than 3 feet. It is gathered by simply shoveling it into barrows and wheeling it out on to firm ground, where it is piled in huge heaps ready for transportation.

The surface of the inclined lake-beds draining to the salt fields is absolutely destitute of vegetation, and usually exhibits no saline efflorescence, since this is dissolved away to supply the salt field. The soil, like that beneath the accumulated salt, is a fine, greenish, saline clay, and may be readily examined in the sides of drainage channels, which score the sloping surface to the depth of 3 or 4 feet.

The method here arranged by nature for dissolving the efflorescent salts from the surface of the lake-beds and evaporating the saline waters in the restricted basin is practically the same as that employed by man on a smaller scale at the Eagle and Desert Crystal Works.

Associated with the salt obtained at the various salt works are greater or less quantities of the borate of soda and the borate of lime, and in some cases, as at the borax works in Alkali Valley, they attain such importance as to afford a considerable quantity of borax. There are many other localities in the Lahontan Basin where the chloride, the borate, the sulphate, and the carbonate of soda exist, sometimes in large quantities, in the incrustations that form on the deserts, but at present the demand is not sufficient to warrant the working of these deposits for economic purposes.

RÉSUMÉ OF CHEMICAL HISTORY.

The fluctuations of Lake Lahontan, so far as we have been able to determine from the study of its chemical records, may be briefly summarized as follows:

The waters first formed a fresh-water lake having approximately the outline represented on the accompanying map⁷⁵—which indicates the extent of the lake at the highest stage of all—and then evaporated away with many minor oscillations, until a greater degree of desiccation of the basin than the present was attained. During this oscillation the waters were saturated with calcium carbonate and deposited vast quantities of lithoid tufa.

Whether the lake evaporated to dryness or not during the time intervening between the formation of the lithoid and thinolitic tufa remains undetermined. The contrast in the character of the tufa formed before and after this event is thought to indicate a partial evaporation, or perhaps complete desiccation, with the burial of the less soluble salts. This is the inter-Lahontan period of desiccation.

The waters next rose to about the level of the thinolite terrace, with many fluctuations, and formed at least two and probably three independent water-bodies, which were more highly charged with saline matter than during the first expansion. From this solution, which was probably nearly identical in the various basins, the mineral after which the thinolite is a pseudomorph was crystallized.

The thinolitic stage was closed by a rise of the lake. The waters were diluted, but probably still contained a larger per cent. of saline matter than during the lithoid stage, and the third or dendritic variety of tufa was deposited on an immense scale, but did not attain as great an elevation on the sides of the basin as the first formed tufa.

During these three major oscillations there were many minor fluctuations of level, as is proven by the large number of variations in the tufas formed.

After the precipitation of the dendritic tufa the lake rose higher than ever before, the evidence being furnished by gravel embankments, terraces,

⁷⁵In pocket at end of volume.

and sedimentary deposits (see Chap. IV), and then evaporated away probably to complete desiccation.

During this last subsidence a thin coating of coral-like tufa was formed, followed by the crystallization of a comparatively limited quantity of thinolite.

When the lake approached complete desiccation after the post-dendritic rise, it became divided into a number of independent areas, as during the inter-Lahontan subsidence. It is presumed that all these basins became completely desiccated, probably for a long term of years, and that the salts precipitated were buried beneath playa deposits so completely that when some of the basins were partially refilled, the salts were not redissolved. This period of desiccation—as determined by calculating the time that would be required for the existing lakes to attain their present degree of salinity—is thought to have terminated not more than three hundred years since.

FIG. 31.—Curve exhibiting the rise and fall of Lake Lahontan: *a a*, deposition of lithoid tufa; *b*, deposition of thinolitic tufa; *c*, deposition of dendritic tufa. The figures indicate, in feet, the fluctuations of the ancient lake above and below the 1882 level of Pyramid Lake.

If we project the fluctuations of Lake Lahontan in a curve (Fig. 31), the ordinates representing depths of the lake at various stages, and the abscissas succession in time, we find there are two maxima and two minima. We know that the first of the two high-water periods was the longer continued, for the terraces the waves then cut in the rocks are broader and more strongly marked than the terraces recording the second rise. The second high-water period was of shorter duration, but the lake rose to a higher level than at the first filling.

The salts impregnating the Lahontan sediments, which are now carried to the surface as efflorescences, are believed to have been absorbed from the waters of the ancient lake by the clays and marls forming its bottom, when the lake was greatly concentrated by evaporation.

CHAPTER VI.

LIFE HISTORY OF LAKE LAHONTAN.

The fossils obtained from the sediments and tufa deposits of Lake Lahontan consist of the bones of mammals and fishes; the shells of fresh-water mollusks and of ostracoid crustaceans; the larval cases of a caddis fly; a single chipped implement of human workmanship; and vegetable vestiges of a doubtful nature.

Mammalian bones were obtained at a number of localities in the sides of the Humboldt and Walker River cañons, and, with the exception of a single vertebra found in the medial gravels, they were all derived from the upper lacustral beds. These fossils were submitted to Prof. O. C. Marsh for determination, but only a partial report as to their character has been rendered. So far as determined they include a proboscidian (elephant or mastodon), a horse, an ox, and a camel. The fossils were usually detached and scattered through the sediments, more than one or two bones of the same individual being seldom found at a single locality, except in the case of the elephant or mastodon bones obtained in the Humboldt Cañon near Rye Patch, where nearly an entire skeleton must have been entombed; many of the bones had been removed, however, before the locality was visited by the writer. The failure to obtain mammalian remains from the lower lacustral deposits is of but little weight as negative evidence, for the reason that the beds are imperfectly exposed; a more critical search would, perhaps, reveal an abundance of fossils.⁷⁶

⁷⁶I would suggest in this connection that the disappearance of a number of large mammals from the fauna of this continent since the deposition of the upper Lahontan sediments may have been caused by the extreme aridity which followed the last recession of the lake. An intensely arid climate

The remains of fishes were found at a few localities in the upper lacustral clays exposed in the Truckee Cañon. No determination of these fossils has been made, farther than the fact that they belonged to *Teleost* fishes of considerable size. They probably indicate that the ancient lake was not strongly alkaline or saline, but, on the other hand, they are not proof that it was fresh; as a number of the brackish lakes of the Great Basin at the present time are abundantly stocked with fish. Little weight can be attached to these fossils, however, in determining the character of the former lake, for the reason that they might have been contributed by inflowing streams even though the water of the lake was a strong brine. Dead fish are sometimes found floating in Great Salt Lake, Utah, which must have come from the inflowing streams. These are preserved for a long time by the brine of the lake but must eventually become buried in the sediments now forming at the bottom of the basin, and, when fossilized, will, in a certain sense, form a false entry in the geological records.

During our examination of the Lahontan basin, fossil shells were obtained at a large number of localities, and in many instances were found in great abundance. Both the fossil and recent mollusks collected, together with the similar material previously obtained by Mr. Gilbert from the Bonneville basin, were studied by Mr. R. Ellsworth Call, who also paid a brief visit to each of the ancient lake basins during the summer of 1883, for the purpose of increasing the collections and making himself personally familiar with the peculiarities of the region. The results of Mr. Call's investigations have been published as Bulletin No. 11 of the Reports of this Survey, to which the reader is referred for detailed information in reference to the fossil shells mentioned in the present volume. Besides the shells inclosed in tufas and lacustral sediments there are others, termed semi-fossil, which

certainly followed the disappearance of the Quaternary lakes of the Far West, and, so far as that region is concerned, this would furnish a sufficient cause for the extinction of the large mammals which were formerly abundant. This hypothesis is open to objections, however. Evidence that an arid climate succeeded the Glacial epoch in the eastern portion of this continent has not been recognized. Even if it could be shown that a period of extreme aridity preceded the present climate, it is difficult to understand why certain mammals, as the elephant, mastodon, horse, camel, megalonyx, etc., should have become extinct, while others no more capable of withstanding great changes of environment should have survived. The recent extinction of a number of mammals is an enigma the solution of which would reflect much light on the mutations of faunas during the older and still more obscure portions of geological history.

frequently occur in abundance on the surfaces of the deserts at a distance from existing streams and lakes. Some of these unquestionably lived in the former lake during its last recession and were left strewn over its bottom when desiccation took place; in many cases, however, the surface shells are true fossils that have been separated from their matrix of clay and marl and accumulated in certain areas by the action of the wind. Other "dead shells," of which *Pyrgula Nevadensis* is an example, have only been obtained about the shores of the existing lakes and are probably still living in their waters; these are also termed semi-fossil.

The thousands of shells obtained are all of fresh-water forms, and include 27 species, grouped under 20 genera and 7 families. The genera and species, together with the horizon from which they were obtained, are indicated in the following table:

Table of shells found in the Lahontan basin.

	Lower La- hontan.	Middle La- hontan.	Upper La- hontan.	Semi-fossil.		Lower La- hontan.	Middle La- hontan.	Upper La- hontan.	Semi-fossil.
Margaritana margaritifera, Linn.			+	+	Limnophysa sumassi, Bd			+	+
Anodonta Nuttalliana, Lea		+	+	+	humilis, Say			+	+
Sphærium dentatum, Hald			+	+	Physa humerosa, Gould			+	+
striatinum, Lam			+	+	Pompholyx effusa, Lea	+	+	+	+
Lisidium ultramontanum, Prm			+	+	Carinifex Newberryi, Lea			+	+
compressum, Prm			+	+	Ancylus Newberryi, Lea			+	+

bulimoides, Lea			+	+					
						1	4	23	27

In arranging the fossils according to their geological horizons we have considered the lower lacustral beds as, at least in part, contemporaneous with the lithoid tufa; the medial gravels have been correlated in time with the thinolitic tufa; and the upper lacustral clays with the dendritic tufa.

As indicated in the list, only a single species (*Pompholyx effusa*) has thus far been derived from the lower lacustral clays. This was found in great abundance in the lithoid tufa on Anaho Island, and was equally com-

mon in other localities at a corresponding geological horizon. This is the most abundant and characteristic fossil of the Lahontan sediments; it occurs from the base of the oldest of the tufa deposits all the way through the series, and is one of three species of mollusks found living in Pyramid Lake at the present day.

All the fossil shells obtained are of recent species, and the majority have been found living in the Great Basin. A comparison of the living and fossil forms has shown that the fossils are depauperate, and exhibit greater variations in the size, thickness and sculpture of their shells than occur in living examples of the various genera and species when obtained from regions where they find a congenial environment. In this connection Mr. Call says:

"The wide range of *Pompholyx* in Lahontan beds makes possible a valuable comparison of the same species from localities representing stages of the lake widely separated in point of time. Specimens taken from the lithoid tufa on Anaho Island, in Pyramid Lake, when compared with those from horizons correlated with the dendritic period present the widest range among individuals. The shells from both localities are higher than Pyramid Lake form, are much thinner, and the coiling of the whorls is much looser. The lithoid tufa specimens present a large proportion of costate forms, the ratio being as 1 to 2, while in recent specimens the ratio is as 1 to 32. The recent species approximate *P. effusa*, var. *solida* Dall, while in sculpture and elevation the earlier forms of the lithoid tufa approach nearest to the typical *P. effusa*, Lea."

Comparative measurements of *Pompholyx effusa* from deposits of lower and upper Lahontan beds, and of specimens found living in Pyramid Lake, show that the average size of the fossils from the older horizon is below that of the Pyramid Lake specimens; while those from the upper Lahontan sediments are larger than the living examples. On comparing the size of the Pyramid Lake specimens with the average of the same species from fresh water localities in the same region, it was found that the shells from fresh water were larger than those obtained from Pyramid Lake, which, it will be remembered, is somewhat saline and alkaline (see analyses, pages 57 and 58). A large number of measurements of fossil and living forms, shows that the

Lahontan fossils are smaller and exhibit greater variation than the same species when living under normal conditions. On comparing the size of *Pompholyx* from Anaho Island (lower Lahontan), "white terrace" (upper Lahontan), and White Pine, Nevada, (living), the ratio of 63: 88: 100 was obtained.⁷⁷

The investigations of conchologists have proven that there are at least three variations of environment which may cause depauperation in fresh water mollusks, viz., salinity, low temperature, and scarcity of food.

As regards salinity, it has been shown that a sudden change from fresh to saline water, i. e., to water resembling that of the ocean, is fatal to fresh-water mollusks. When the change is gradual the life of the species may be maintained until a considerable degree of salinity is reached, but the limit has not been determined, and is known to vary widely with different species. To make the experiments in this direction definite and comparable with the gradual changes which take place in the waters of inclosed lakes, would require a much greater length of time than has yet been devoted to the subject. Enough has been determined, however, to show that a gradual increase in the salinity of a lake would be accompanied with the depauperation and decrease of its molluscan life; should the salinity continue to increase until a condition approximating that of the ocean was reached, the molluscan life would become nearly if not completely extinct. We may reasonably conclude, therefore, that the waters of Lake Lahontan were not strongly alkaline or saline during the time the sediments and tufas so richly charged with fossil shells were deposited. It is perhaps well to mention in this connection that there is no reason to doubt that the mollusks whose shells are found in such abundance actually inhabited the ancient lake. They could not have been contributed by inflowing streams and are not found in exceptional abundance where springs entered the lake. The degree of salinity attained by the ancient lake cannot be determined, but, as we have seen, must have been low, at least during the high-water stages. This conclusion is most definite in the case of the upper lacustral marls which are frequently charged with the shells of *Anodonta*, a genus which, at the present time, is confined to waters of exceptional purity.

⁷⁷ These measurements refer to the length of the shells.

In the experiments that have been made in reference to the influence of saline waters on the life and growth of fresh water mollusks, the effect of common salt (sodium chloride) has principally been considered. The lakes of Nevada, however, are characterized by the presence of alkaline carbonates, which it is believed have a more decidedly deleterious effect on the life and growth of fresh water mollusks than common salt. This consideration lends still greater weight to the conclusion that the waters of the former lake were not highly charged with mineral matter during the time the fossil-bearing sediments and tufas were formed.

The condition of several of the enclosed lakes of the Great Basin at the present time, however, indicates that a very moderate degree of salinity and alkalinity is perhaps favorable to the growth of fresh water mollusks. Franklin, Ruby and Humboldt lakes are all more highly charged with salts than is the case with ordinary lakes and streams (the total of solids in solution, however, not exceeding a small fraction of 1 per cent.) but have an abundant molluscan fauna. The inference is that a decided although indefinite degree of salinity is requisite to produce depauperation. In the more strongly saline and alkaline lakes, of which Mono, Abert and Great Salt Lake are examples, careful search has been made for living mollusks but none have been found. These lakes are believed to be entirely destitute of both molluscan and piscine life.

As Lake Lahontan never overflowed, it is safe to conclude that its waters at all times must have been less pure than those of ordinary lakes with outlet. The depauperation of its fossils and their variation in size at various horizons, are thus correlated with known saline and alkaline conditions, which also varied with fluctuations of lake level. We conclude, therefore, that at least one cause of the depauperation of the mollusks now found fossil was the chemical composition of the waters they inhabited.

In reference to the evidence furnished by the Lahontan fossils as to the climate of the Quaternary, a conclusion seems impossible at this stage of the investigation, for the reason that a sufficient cause for the observed variation and depauperation of the shells has been found in the chemical character of the waters in which they lived. If we postulate a cold Quaternary climate, the logical sequence would be a depauperation of the fresh-

water mollusks; but since a similar change would result from the necessary chemical condition of the waters of an inclosed lake in which concentration had been long continued, no definite conclusion as to the effect of the low temperature seems possible. On the other hand, a warm Quaternary climate would presumably be favorable to the growth of mollusks, but even if the climatic conditions were favorable, a more potent element in their environment caused the shells to become depauperate.

Mr. Call's studies have shown that the molluscan fauna of Lake Lahontan was characterized by the predominance of the *Limnæidæ*. This family of mollusks at the present time is of world-wide distribution, but is found most abundantly in cold-temperate and subarctic regions. During the Quaternary it may be presumed to have had a similar isothermal distribution. Thus in a very general way it might be inferred that the Quaternary climate in the region of Lake Lahontan was colder than at present. The wide distribution of the *Limnæidæ*, however, and their known powers of enduring marked changes of environment, render this conclusion of doubtful value. The majority of the molluscan species that inhabited Lake Lahontan are still living in the Great Basin, and so far as this branch of the palæontological evidence bears witness, we see no reason for concluding that the former climatic conditions differed materially from the present. The only safe inference seems to be that the climate of the Great Basin during the life of the mollusks we are considering was not characterized in mean temperature by *extremes* of either heat or cold.

As regards the scarcity of food in Lake Lahontan, in reference to the depauperation of its molluscan fauna, we know that the mollusks now found fossil, like their living representatives, must have subsisted mainly on con-
vervoid growths. This form of vegetable life flourishes not only in fresh, but also in brackish and alkaline waters, as may be seen in the various lakes of the Great Basin at the present time. There is therefore no reason to conclude from the probable composition of the waters of Lake Lahontan that food of the character required by mollusks was not abundant. The profusion of fossil shells in the sediments and tufas leads to the same conclusion, for without sufficient food molluscan life could not have been so prolific.

The fossils that might be expected to throw the most light on the climatic problem are the mammalian remains, but, unfortunately, up to the present time these have been found in such limited numbers that but little evidence as to the nature of former climatic changes can be derived from them.

Throughout Lahontan history *Pompholyx effusa* was the most abundant species in the molluscan fauna, but only a very few individuals of this genus have been found living in the present lakes of the basin. Moreover, the dead shells of *Pyrgula Nevadensis* occur in profusion on the shores of Pyramid and Walker lakes, but have not been discovered among Lahontan fossils. This species is probably now living in the lakes of the region, as is indicated by the fresh appearance of the shells, in some of which the soft parts of the mollusks are still adhering.

The occurrence of *Pompholyx* throughout the Lahontan series and its rarity in the existing lakes of the basin, as well as the absence of *Pyrgula* from Lahontan fossils, and its abundance in a semi-fossil condition, are believed to indicate that there was an *interregnum* between the time of Lake Lahontan and the beginning of the present lakes of the basin. If our reading of the records is correct, this time of change was a period of extreme desiccation during which the lakes of the region evaporated to dryness, their salts becoming buried beneath playa deposits, and their molluscan life nearly if not completely exterminated.

The absence of *Pyrgula* in Lahontan sediments, and its abundance in a semi-fossil condition about the shores of the present lakes, in which it is now rare, seems explicable on the assumption that it was introduced into the basin at a recent date and found a congenial habitat in the mildly saline waters of Pyramid and Walker lakes. Subsequently these lakes became too saline and alkaline for its existence, and it was nearly if not completely exterminated, so far as they are concerned. The present chemical composition of the lakes in question is believed to indicate about the limit of salinity or alkalinity that fresh-water mollusks can sustain.

The cases of a minute crustacean of the genus *Cypris* occur throughout the Lahontan series, and at times are so abundant that they form the principal portion of strata for several feet in thickness, as may be seen in

the walls of the Truckee Cañon. At the base of the layer of dendritic tufa exposed along the Humboldt and Truckee rivers this fossil occurs in profusion, frequently intermingled with the shells of *Pompholyx*. On the borders of the Carson Desert the cases of *Cypris* have been accumulated by the wind in such quantities as to form small drifts resembling sand dunes. What specific name this fossil may bear has not been determined, but species with which it is evidently closely related are known to live in both fresh and salt water. Its value, therefore, as indicating the nature of its environment in Lake Lahontan is indefinite.

FIG. 32.—Larval cases of a caddis fly encased in lithoid tufa.

At a single locality, the larval cases of a caddis fly were obtained, which were coated over and partially imbedded in lithoid tufa (Fig. 32). This fossil is very similar to the larval cases of the caddis fly now found abundantly in streams and lakes, and, so far as the evidence goes, indicates that the waters in which the fossils were formed were not intensely alkaline or saline.

The worm-like larval cases of a fly occur in the tufa about the Soda Lakes near Ragtown, but these are evidently of quite recent date and cannot be considered as Lahontan fossils.

The fossil from the Lahontan basin that will probably be considered by both geologists and archæologists as of the greatest interest, is a spear-

head of human workmanship. This was obtained by Mr. McGee, from the upper lacustral clays exposed in the walls of Walker River Cañon, and was associated in such a manner with the bones of an elephant, or mastodon, as to leave no doubt as to their having been buried at approximately the same time. Both are genuine fossils of the upper Lahontan period. The spear-head is of chipped obsidian and is in all respects similar to many other implements of the same nature found, commonly on the surface, throughout the Far West. It was discovered projecting point outwards from a vertical scarp of lacustral clays 25 feet below the top of the section, at a locality where there were no signs of recent disturbance. This fossil, which is the only evidence at present known of the existence of man on the shores of the Quaternary lakes of the Great Basin, is represented natural size in the following figure.

FIG. 33.—Spear-head of obsidian from Lahontan sediments.

The only fossils of a vegetable nature thus far referred to Lake Lahontan are certain problematic, stemlike tubes, from one to two inches in length, and approximately the thirtieth of an inch in diameter, which occur in great profusion at the base of the lithoid tufa on Anaho Island. In some places the lower two or three feet of the tufa is very largely composed of these remains. Our reference of these fossils to the vegetable kingdom is only provisional, however, as they have been examined by several skilled palæontologists without having their relations definitely determined. It has been suggested that they are the casts of grass-like stems, but their uniform diameter and the absence of joints seems to preclude this determination. In describing the variations presented by *Pompholyx* from Anaho Island, Mr. W. H. Dall has spoken of these fossils as the casts of the leaves or needles of the pine;⁷⁸ it is possible that this may be the true explanation of the enigma.

⁷⁸ Science, Vol. I, 1883, p. 202.

No leaves or vegetable stems of any kind, excepting the fossils mentioned in the last paragraph, have been found among the records of the old lake, and no drift timbers seem to have been deposited in the bars and embankments that have been examined. The absence of such fossils apparently indicates that the shores of the former lake were not heavily wooded. The borders of our Northern lakes at the present day are thickly clothed with forests and their shores encumbered with stranded logs and stumps in such quantities as to have considerable influence on the character of the shore phenomena resulting from wave action. Had the shores of Lake Lahontan been as densely wooded as are those of Lake Michigan, for example, it seems impossible that abundant records of the fact should not have been discovered during our sojourn in the basin.

A superficial microscopical examination of the sediments of the ancient lake has shown that they are richly charged with the silicious skeletons of infusoria, and sometimes abound in sponge spiculæ. A detailed study of these fossils was not practicable, and, as these forms of life are so widely distributed and live under such diverse conditions, it seems doubtful in the present instance, if a more critical examination would greatly assist in solving the chemical and climatic problems with which the student of the Quaternary geology of the Great Basin is principally concerned.

No fossils have been found in the thinolitic tufa, although careful search has been made at many localities. At times shells may be seen in the open spaces between the crystals, but these are believed in all cases to have been accidentally introduced at a recent date. The absence of all life records in this deposit strengthens the hypothesis that the thinolite was crystallized from waters highly charged with mineral matter.

In correlating the various Lahontan deposits we have considered the thinolite as stratigraphically intermediate between the lower and upper lacustral clays, and, at least in part, contemporaneous with the medial gravels. The fossils obtained from the medial gravels are of fresh-water species, but were collected near the borders of the basin and at a greater elevation than the upper limit of the thinolite. The fossils may thus represent a stage in the recession or in the refilling of the lake when its waters were not so dense as when the thinolite was crystallized. In the Humboldt

Cañon where fossils were found in the medial gravels, it is probable that the strata are in part a flood plain deposit, accumulated when the lake was below that horizon.

SUMMARY.

The evidence derived from organic remains indicates that Lake Lahontan throughout its higher stages was never a strong saline and alkaline solution. Even during the abundant precipitation of dendritic tufa the lake was inhabited by mollusks in great numbers, and was probably also the home of *Teleost* fishes of large size. During the thinolitic stage, when its waters were greatly concentrated by evaporation, the absence of fossils indicates that it was uninhabited by either fishes or mollusks.

The life history of the lake, as we know it at present, cannot be considered as affording definite information in reference to the character of the climate during the Quaternary. The reason is that any change in the molluscan life that might be due to climatic oscillations, is complicated and masked by the effects produced by variations in the chemical composition of the waters.

When other basins in the same region are explored, especially those which found outlet, the character of their molluscan fossils may lead to positive conclusions in this direction, for in such instances the influence of an abnormal chemical condition of the waters on the growth of mollusks would be eliminated.

CHAPTER VII.

RÉSUMÉ OF THE HISTORY OF LAKE LAHONTAN.

The history of the fluctuations of the Quaternary lake of northwestern Nevada is recorded in various ways, as has been described in the last three chapters, which treat it from the physical, chemical, and biological standpoints; in the present chapter it is our purpose to present briefly the conclusions based upon these various lines of evidence. The phenomena observed have great diversity of character, but when interpreted in terms of geological history, they support and supplement each other in such a way that the conclusions drawn are believed to be well sustained. Moreover, the facts observed in the Bonneville basin and in more than a score of desert valleys throughout the northern half of the Great Basin which contained contemporary water-bodies, harmonize with the interpretation of the Lahontan record here presented.

The fact that all the minor basins in the arid regions of the Far West are filled to a depth of many hundreds of feet with alluvium and lacustral sediments, together with the occurrence of the beach lines of the Quaternary lakes on the surface of the vast alluvial cones, leads to the conclusion that all these basins were barren deserts before the rise of the Quaternary lakes. The pre-Lahontan condition of northwestern Nevada must have closely resembled its present character, but at times it was probably completely desiccated.

The change of climate admitting of the existence and gradual expansion of lakes in the various valleys throughout the Great Basin caused a number of those situated in northwestern Nevada to rise sufficiently to unite and form a single irregular water-body 8,922 square miles in area. This

was the first rise of Lake Lahontan. Like all inclosed lakes it must have fluctuated in depth and extent with the alternation of arid and humid seasons, and risen and subsided also in response to more general climatic oscillations, which extended through years and perhaps embraced centuries. Finally the climatic conditions which favored lake expansion ceased, and a time of aridity, like that which preceded the first rise, was initiated. The lake slowly contracted until its basin reached a greater degree of desiccation than that now prevailing. This was the inter-Lahontan period of desiccation.

During the first rise lacustral marls and clays were deposited throughout the basin; the depth of these is unknown, but they certainly exceed 150 feet in thickness. The waters were saturated with calcium carbonate and the precipitation of great quantities of compact stony tufa took place. Deposits of tufa were formed on rocky slopes throughout the basin, and are not especially abundant at the mouths of streams. This is thought to indicate that although the waters were saturated with calcium carbonate, they were not highly charged with other chemical substances. This conclusion is sustained by observation of conditions under which a similar tufa is being deposited in existing lakes, and also by the presence of gasteropod shells in the lithoid tufa in great abundance.

The time of low water, and perhaps of complete desiccation, that succeeded the first rise of Lake Lahontan, is recorded by stream channels carved in the lacustral beds and by current-bedded gravels and sands superimposed upon previously formed strata. Sections of inter-Lahontan gravel deposits have been observed wherever the material filling the lake basin is well exposed, and furnish indisputable evidence that the lake was greatly lowered before the gravels were deposited. These gravels were in turn covered by a second lacustral deposit, thus forming a tripartite series, a counterpart of which exists in the Bonneville basin. The first formed tufa deposit was exposed to subaërial erosion during the inter-Lahontan period of low water and became broken and defaced.

The character of the next succeeding tufa deposit indicates that a change had taken place in the chemical conditions of the waters of the lake when the basin was again partially flooded. This alteration in the composition of the salts dissolved in the lake is thought to have been brought

about by a partial deposition of the saline matter accumulated during the first high-water stage, at the time of the inter-Lahontan period of desiccation. The tufa superimposed upon the lithoid variety is known as thinolite; it is composed of well-defined crystals and is without fossils. It was evidently precipitated from a more highly concentrated chemical solution than that from which the lithoid variety was deposited. That this was the case is rendered evident, since the crystalline variety occurs only low down in the basin, while the lithoid tufa may be found within 30 feet of the highest terrace carved by the waters of the ancient lake.

After the crystallization of thinolite had been carried on for an indefinite period, the lake rose to within 180 feet of its first maximum, and the heaviest deposit of calcium carbonate found in the basin was precipitated. During this stage the lake was not strongly saline, as is shown by the abundance of gasteropod shells obtained from the sediments and tufas accumulated during this portion of its history.

After the precipitation of the dendritic tufa, the lake continued to rise and at last reached a horizon 30 feet higher than the first maximum. During this expansion the waters lingered but a comparatively brief time at the highest level and then slowly subsided. The increase in depth after the deposition of dendritic tufa is shown by the presence of lacustral sediments upon that deposit. The structure of the higher bars and embankments about the border of the old lake basin, proves conclusively that the greatest lake expansion was during the second rise.

With the last recession of the lake all portions of its basin were brought within the reach of wave action, and the tufa deposits sheathing its interior were broken, and the fragments swept away by currents, and built into embankments and terraces. The waters continued to fall until the basin was completely dry. All the salts not previously precipitated were deposited as desiccation advanced, and became buried and absorbed by playa clays. The proof of the occurrence of this time of desiccation is furnished by the comparatively fresh condition of the existing lakes of the basin, and by the change in the molluscan fauna which took place since the last high-water period. The duration of this post-Lahontan arid period is unknown, but

it was finally terminated—probably less than 300 years since—by an increase in humidity. The present lakes then commenced their existence.

Throughout its history, Lake Lahontan has been subject to a multitude of minor oscillations, as is indicated by the banded and stratified character of the tufa deposits lining the interior of its basin.

The character of the climatic changes which brought about both the great expansions and contractions of Lake Lahontan, as well as the minor fluctuations to which it was subject, will be indicated, so far as the writer has been able to interpret the records, in the following chapter.

CHAPTER VIII.

QUATERNARY CLIMATE.

In preceding chapters we have considered the physical, chemical, and biological histories of Lake Lahontan, as determined from facts gleaned here and there in its now empty basin. In each of these chapters reference has been made to the climatic conditions on which these various elements of history depended. In the present chapter it will be our aim to review the evidence afforded by the records of the ancient lake which have a bearing on the determination of the climatic conditions that permitted of its existence.

The investigations of naturalists have shown that the fauna and flora of a region are expressions of its climatic condition. To the geologist, the physiography of a country reflects, with nearly equal clearness, the effects of that resultant of a plexus of independent meteoric forces, designated by the term climate. Each year, as the seasons succeed each other, the geological changes, that are ever active, although so slowly and so silently that many times they escape observation, may be correlated with the elements of climate on which they are most closely dependent. Of the atmospheric forces at work, on every hand, in remodeling the earth's surface, those dependent upon humidity and temperature are the most obvious. These vary in intensity with the seasons, and at times their independent workings may be observed. Throughout the geological ages these same invisible agents of the air have never ceased to work changes on the earth, at times surrounding it with warmth, beauty, and life, and again, as the æons passed on, blotting out the fair picture themselves had drawn, and replacing it with cold, desolation, and death.

The general effects of climate are so well known that one may predict the results produced by its various elements on the aspect of a given region.

The geologist is enabled to reverse this process, with greater or less success, and, from the records in the rocks, determine the prevailing climatic conditions of bygone ages. The interpretation of the Lahontan records in terms of climate is at the same time the most interesting and the most difficult of the problems that their study has suggested. The character of the Quaternary climate of the Great Basin has been treated in a comprehensive manner by Mr. Gilbert in a monograph on Lake Bonneville, which, it is expected, will soon be published. We are thus, not unwillingly, constrained to confine our studies to the evidence afforded by the records of Lake Lahontan. Our attention will necessarily be mainly directed to the questions of humidity and of temperature.

Among the topographic characteristics of arid regions are angular mountain tops, cañons with precipitous walls, and alluvial cones where streams from the mountains lose their grade upon reaching the valleys. The last of these features is perhaps as striking as any of the others, and is of special interest in the present discussion. Many times the bases of mountains are completely encircled by a sloping pediment of unassorted *débris*, either angular or rounded, which is the most abundant at the mouths of cañons. Such accumulations form alluvial slopes, and when the *débris* occurs in more or less conical or fan-shaped piles it forms alluvial cones. These deposits have been studied especially by Drew⁷⁹ and Gilbert;⁸⁰ by the former in the arid regions of Southern Asia, by the latter in the Great Basin. As described by Gilbert, "The sculpture of a mountain by rain is a twofold process—on the one hand destructive, on the other constructive. The upper parts are eaten away in gorges and amphitheaters until the intervening remnants are reduced to sharp-edged spurs and crests, and all the detritus thus produced is swept outward and downward by the flowing waters and deposited beyond the mouths of the mountain gorges. A large share of it remains at the foot of the mountain mass, being built into a smooth sloping pediment. If the outward flow of water were equal in all directions this pediment would be uniform upon all sides, but there is a principle of concentration involved, whereby rill joins with rill, creek with

⁷⁹ Journal Geological Society of London, Vol. XXIX, 1873, pp. 441-471.

⁸⁰ Second Annual Report U. S. Geological Survey, p. 183 *et seq.*

creek, and gorge with gorge, so that then when the water leaves the margin of the rocky mass it is always united into a comparatively small number of streams, and it is by these that the entire volume of detritus is discharged. About the mouth of each gorge a symmetric heap of alluvium is produced, a conical mass, of low slope, descending equally in all directions from the point of issue, and the base of each mountain exhibits a series of such alluvial cones, each with its apex at the mouth of a gorge, and with its broad base resting upon the adjacent plain or valley. Rarely these cones stand so far apart as to be completely individual and distinct, but usually the parent gorges are so thickly set along the mountain front that the cones are more or less united, and give to the contours of the mountain base a scalloped outline."

In the Lahontan basin alluvial cones are to be seen everywhere about the bases of the mountains, and were evidently a conspicuous feature in the pre-Lahontan topography, as is abundantly illustrated by the fact that the shore lines of the former lake are traceable for hundreds of miles on alluvial slopes of great magnitude. This is particularly noticeable in the northern portion of the basin where the lake was generally shallow, and may be observed especially in the Humboldt and Quinn River valleys and about the bases of the Slumbering Hills. The same phenomenon is also conspicuous about the borders of the Carson Desert and in Buffalo Spring, Alkali and Mason valleys, as well as at many places on the borders of Walker Lake Valley. These alluvial slopes streaming down from the mountains to a horizon far below the old beach lines, bear evidence that the valleys were deeply filled with alluvium before they were occupied by the Quaternary lake. Since many of these basins never overflowed, it is evident that the alluvial slopes were formed during a time of desiccation when evaporation equaled or exceeded precipitation. If this had not been the case, it is manifest that lakes would have been formed and the *débris* filling their basins arranged in stratified beds or built into bars and embankments. A large number of valleys in the northern part of the Great Basin which held inclosed Quaternary lakes have been explored, and in each instance the same relation of shore terraces to previously formed alluvial slopes has been observed. It is therefore considered as proven

that an arid climate prevailed for a long time previous to the existence of the Quaternary lakes, the records of which are now observable. The rate at which alluvial cones are formed is irregular and depends on a number of variable factors, as, for example, the amount of precipitation, the grade of the cañons, character of the rock forming the mountain, etc. As the geological and topographical conditions at a definite locality may be considered constant, so far as the present discussion is concerned, it is evident that alluvial cones are in some manner a record of rainfall. Many observations have shown that they are usually formed in arid regions, and result from sudden storms which flush the cañons and sweep out the accumulated *débris* with violence. This is observable not only during the occasional "cloud bursts," as the sudden storms of the Far West are called, but may also be inferred from the occurrence of angular rocks, weighing many tons, on the surfaces of the alluvial cones. During the intervals between the storms, disintegration takes place in the uplands, and the smaller tributaries deposit their loads in the larger cañons, which thus become charged with *débris*. The rapid deposition of alluvium about the mouths of cañons is largely influenced by the fact that what was entirely a surface stream during its cañon course, sinks below the surface on passing to the alluvial slope and deposits its load. These considerations might be extended and the action of perennial streams contrasted with the results produced by infrequent storms, but perhaps enough has already been written to show that alluvial cones are not only characteristic of arid climates but that the precipitation which produced them is commonly paroxysmal. There is manifestly no uniform rate at which subaërial alluviation takes place and no definite measure of the time necessary for the accumulation of *débris* of this character, but the comparative size of the deposits made during distinct periods furnishes at least a general indication of the relative length of time required for their accumulation.

Assuming that the conditions of alluviation were equally favorable during the pre-Lahontan and recent arid periods, we may determine from the magnitude of the subaërial deposits in each instance the relative duration of the two periods. The Lahontan terraces carved on the slopes of ancient alluvial cones are but delicate inscriptions which, in a geological

sense, are extremely ephemeral, yet they are clearly legible at the present day, thus indicating the recency of their origin. The time that the terraces have been exposed to subaërial erosion must evidently be extremely brief in comparison to the ages required for the accumulation of the vast *débris* piles on which they were made.

Another, although less definite proof of the aridity of the time preceding the rise of Lake Lahontan is furnished by the cañons of the streams that enter the basin. In many instances these were excavated to their present depth before the existence of the lake, which subsequently occupied their channels for many miles. An illustration of this phenomenon is furnished by the cañons of Smoke and Buffalo creeks, which were eroded to the depth of 250 or 300 feet through compact basalt before the rise of Lake Lahontan. When the lake had its greatest extension it occupied the lower portions of these gorges and filled them deeply with marly-clays and delta deposits, at the same time that their walls became loaded with tufa. When the lake retired the streams reclaimed their ancient channels and commenced the removal of the lacustral strata. The creeks are now flowing over their ancient beds of basalt, but the recent corrasion of the volcanic rock is scarcely perceptible. The amount by which the cañons have been deepened during the present arid period, as compared with the work accomplished in pre-Lahontan times, is certainly in the proportion of one to many thousand. Parallel illustrations of the same phenomena are furnished by the rivers which enter the basin from the west, all of which flow in channels of pre-Lahontan date, and became partially filled with lacustrine strata and subsequently re-excavated as in the previous instances. Each of these streams now flows through a cañon within a cañon, in the manner illustrated by the diagram on page 44.

It might be said that when these cañons were formed, the basin to which they are now tributary had a free drainage to the sea. It is impossible to prove or disprove this hypothesis, but in general, cañons of the character of those in question may be considered as characteristic of arid regions. Besides, we know, from the great depth of marl and gravel in many of the valleys of the Great Basin, that they have been regions of accumulation for long periods. The weight of evidence is such, in our

judgment, as to confirm the hypothesis that an arid period of long duration preceded the first rise of Lake Lahontan of which we have definite knowledge.

The variations and fluctuations of the pre-Lahontan arid period are unknown, but, from the general teachings of meteorology, we may reasonably conclude that, like the present climate of the Great Basin, it was marked by many fluctuations in precipitation and evaporation, which at times gave origin to lakes of greater or less extent. As the arid period drew to a close and more humid conditions prevailed, it is most reasonable to suppose that the change was gradual. The phenomena do not call for a sudden break in the processes of nature.

Humidity of the Lahontan period.—Inclosed lakes may be considered as representing the net balance between precipitation and evaporation. As the relations of these two climatic elements are complex and independent, their resultant will be inconstant and variable; their mutual neutralization, so far as the lakes of a region are concerned, must, therefore, be a matter of delicate adjustment. It follows from this that the difference in climate between a time of expanded lakes and a time of desiccation might be comparatively moderate.

In a given area, like the Great Basin, we may safely say that a lowering of the mean annual temperature will increase precipitation and decrease evaporation, thus affording the climatic conditions favorable to the expansion of the lakes. On the other hand, a rise in the mean annual temperature would increase evaporation and decrease precipitation, thus favoring the contraction and extinction of inclosed lakes. The existence of a large number of lakes in the Great Basin during the Quaternary is seemingly good evidence that the climate of the region during the time of their greater expansion was more humid than at present; unless it can be shown that there was a very great decrease of evaporation without a corresponding increase of precipitation, a phenomenon only to be observed at the present time in the arctic latitudes.

That many of the lakes did not overflow is equally positive evidence that precipitation within their hydrographic basins could not have been excessive. Had the rainfall been even moderately copious, it seems self-

evident that the entire Great Basin must have become tributary to the ocean. Inclosed lakes of the present time are located in arid regions. The lakes of humid regions invariably overflow. In arid countries the water surfaces of the lakes are small in comparison to the areas that they drain; in humid regions the reverse is the rule. Lake Lahontan, as previously stated, was 8,422 square miles in area, and drained a region over 40,000 square miles in extent; the water surface of the basin at the present time is approximately 1,500 square miles. The Quaternary lake during its maximum, occupied approximately one-fifth of its hydrographic basin; at the present time only about one-twenty-sixth of the same area is covered by water. From these data alone it will be seen that the present is a time of desiccation in comparison to certain portions of the Quaternary.

Comparing Lake Lahontan with existing lakes in humid regions, we find that its water surface was small in reference to its drainage area. In the case of Lake Superior, for example, the area of the lake is to the area of its hydrographic basin as 1 to 1.72. The combined areas of the Laurentian lakes is to their combined drainage areas as 1 to 3.19.⁸¹ Could the Laurentian lakes be inclosed, so that the only escape for their waters would be by evaporation, it is evident that they would expand and occupy a vastly larger part of their drainage areas than at present. In fact, the mean annual evaporation in this region is much less than the mean annual rainfall, so that an inclosed lake would be an impossibility.⁸²

⁸¹In obtaining the data given above, the following table was compiled, which we insert for convenience of reference.

Areas of lakes and of their hydrographic basins.

Lakes.	Water areas.	Hydrographic areas.	Ratio of water area to hydrographic area.
	<i>Square miles.</i>	<i>Square miles.</i>	
Superior	30,829	84,961	1 to 1.72
Michigan (including Green Bay)	21,729		
Huron (including Northwest Passage 1,556, and Georgian Bay 5,626)	22,322		
Saint Clair	396		
Erie	9,633		
Ontario	7,104		
Combined areas	93,733	299,919	1 to 3.19
Bonneville	19,750	52,000	1 to 2.63

⁸² Ann. Rep. Chief of Engineers, U. S. A., 1869, pp. 645-648.

Considerations of this character might be multiplied, but it is presumed that enough has already been written to show that the climatic change which gave origin to Lake Lahontan but did not permit it to overflow, must have been one of moderate precipitation in comparison, for example, with the present rainfall of the region of the Laurentian lakes, even if we consider the rate of evaporation in the Great Basin to have been the same during the Quaternary as now. An increase in the annual rainfall of a region may safely be considered as causing a decrease in the mean evaporation, thus indicating that the rainfall in the region of Lake Lahontan during the Quaternary, could not have been greatly in excess of the present mean annual precipitation in the same area. It will be seen from this that the history of Lake Lahontan is decidedly in opposition to the hypothesis that the climate of the Glacial epoch was characterized by a marked increase in precipitation.

A safe conclusion seems to be that the change from arid to more humid conditions which produced the Quaternary lakes of the Great Basin was not sudden or excessive, but consisted in gradual climatic oscillations of *moderate range*.

Considering the question of humidity alone, we venture to correlate periods of lake expansion with an increase in mean annual precipitation; and periods of contraction and desiccation with decrease of rainfall. We therefore use the diagram representing the fluctuations of Lake Lahontan, as an expression of the humidity element in the climate of the region during the Quaternary. Interpreting the curve representing the oscillations of the lake in terms of humidity we have:

FIG. 34.—Curve of Lahontan climate. Wet *versus* dry.

Temperature of the Lahontan Period.—Considering temperature as the controlling climatic element—in reference to a restricted region, as in the preceding discussion—and knowing that a high temperature promotes evaporation and hence tends to decrease the volume of lakes, and that a low temperature produces a contrary result, we should apparently be justified in concluding that as the Quaternary lakes of the Great Basin were larger than the present water-bodies of the same region, the former climate must have been colder than the present. It may be said, however, that had the cold been intense and produced arctic conditions, precipitation would have been retarded. This postulate, however, is not applicable to the area in question, where the climatic oscillations were of moderate intensity even in comparison with the present prevailing arid conditions, thus indicating that if the periods of desiccation were times of arctic cold, the lake periods must have been at least sub-arctic. On this assumption the Great Basin to-day should have a climate resembling that of circumpolar lands. The absence of “ice walls” about the smaller of the Quaternary lakes of the Far West is negative evidence, perhaps of some value, in opposition to the above hypothesis. Moreover, the character of the abundant molluscan fauna of the Lahontan basin precludes the hypothesis of an arctic climate.

If we postulate sub-tropical or tropical conditions of the Lahontan basin during the Quaternary, we must, from the analogy of tropical countries in general, conclude that the region would probably have been humid as well as warm, and consequently productive of abundant faunas and floras. The absence of fossils indicative of such conditions is sufficient evidence that they did not prevail. In the chapter devoted to the life history of the former lake it has been shown that its shores must have been at least as desolate and lifeless as the borders of the existing lakes of the same region.

The alternation of humid and arid conditions during the Quaternary finds, perhaps, its best analogue in the present annual climatic changes of the same region. The seasons in the Great Basin are two, an arid and a humid, the former being of the greater length. In the winter precipitation is abundant in comparison with the summer; in fact nearly the entire rainfall of the year takes place between December and March. During these months the skies are clouded, and rain and snow are not infrequent; the

rivers rise, and many channels that are completely dry during the summer become flooded; the inclosed lakes increase in area and many new ones are formed in basins that are parched deserts during the summer months. The winter season is, therefore, the humid period, during which evaporation is decreased, and is in every way favorable to the existence of lakes. Could these conditions be continued for a sufficient length of time each year it is evident that the Quaternary lake basin would be refilled.

On the other hand, throughout the arid season the rain ceases almost entirely, the skies are clear and cloudless for days and perhaps weeks at a time; the heat in the desert valleys becomes intense, and evaporation is greatly accelerated. The result is a decrease and failure of the streams and the shrinkage and disappearance of the lakes. These annual changes illustrate the character of the secular oscillations that took place during the Quaternary.

The former great extension of the lakes of the Great Basin is, therefore, considered as evidence that the mean annual temperature was then lower than at present. Interpreting the curve given on page 237, which indicates the fluctuations of the Lake Lahontan, in terms of temperature we have the following as a generalized diagram of this element in the climate of the Quaternary:

FIG. 35.—Curve of Lahontan climate. Cold *versus* warm.

In the last few pages of this attempt to decipher the prevailing characteristics of the climate of the Quaternary in the region of Lake Lahontan, the questions of humidity and temperature have been considered in reference to a *restricted area*. In treating of such a complicated and far-reaching question, however, it is evident that we should not be confined by geographical limits, but must count the changes of climate in broad and perhaps far-

distant regions. In fact, a study of the climate of a given region, to be complete, must contemplate the atmospheric phenomena of the world. Neither can we postulate an alteration of a single element in the climatic environment of a region without altering the relations of all the remaining elements. Hence the interpretation of geological records in terms of climate become more and more difficult.

Our conclusions, therefore, in reference to the climate of the Quaternary are at the best somewhat arbitrary and are open to controversy. The weight of evidence and the impressions which one receives from the study of the phenomena in question are such as to lead to at least a well-grounded opinion, even if some of the facts observed might be interpreted differently by different observers.

The present arid climate of the Great Basin cannot be explained by saying that the temperature is high and consequently the water that is precipitated is rapidly evaporated. On the contrary, evaporation is rapid, probably for the reason that precipitation is moderate, or, perhaps more accurately, because the mean annual humidity of the atmosphere is low. In explanation of the present aridity some writers have attempted to show that as the prevailing winds blow from the Pacific, and consequently are obliged to cross the Sierra Nevada before reaching the Great Basin, the mountains condense their moisture, and hence they reach the region to the eastward as drying winds. In this explanation it is forgotten that the Sierra Nevada is scarcely, if at all, more humid than the Wasatch or some of the higher of the basin ranges, and that much of the Pacific slope is also an arid country, although situated between the ocean and the mountains that are supposed to rob the winds of their moisture. Other explanations of the aridity of much of the region west of the Rocky Mountains have been advanced, but it remained for Captain Dutton to present the view that apparently has the strongest foundation.⁸³ This writer explains the aridity by peculiarities of the currents of the Pacific. In brief, this theory assumes that the currents from the north which follow the western border of the continent cool the air that is carried over them towards the land, this being the prevailing direction of the air currents of the region; consequently, on reaching the

⁸³American Journal of Science, Vol. XXII, 1881, pp. 247-250.

land, the air has its temperature increased, and thus becomes a dry wind. If this explanation of the present climatic condition of the Great Basin be accepted, it is evident that past fluctuations in the climate of the same region could be accounted for by assuming changes of direction in the currents of the Pacific.

Testimony of the Glaciers.—Thus far our discussion has been confined to the evidence afforded by the records of the ancient lakes. It is manifest that the glaciers which existed on the neighboring mountains during the time the lakes were flooded should furnish additional evidence bearing on the same question.

The climatic conditions favoring the origin and growth of glaciers has recently been a subject of controversy. Some writers have claimed that the Glacial epoch was a warm period, in comparison with the present, and that the extension of the glaciers was due to an increase of precipitation caused by a greater evaporation over distant oceanic surfaces, the increased evaporation being caused by a general rise of the mean annual temperature. This hypothesis, we believe, was first suggested by Tyndall and Frankland, and has been extended by Professor Whitney in his work on "Climatic Changes in Later Geological Times." A number of articles in various scientific journals have also been published in extension and support of the same assumption.

It is beyond the scope of the present volume to enter into the theoretical discussion thus opened, nor is it necessary, as the arguments brought forward by the writers cited above have been controverted by Newberry, Dutton, Gilbert, and others, who adhere to what may be called the orthodox belief—having been held by the majority of writers on geological climate—that glaciers are an index of cold, and that their great increase during the Quaternary was due to a decrease in mean annual temperature. In other words, the winters during the Glacial epoch were longer or more severe than at present, and their snows not completely melted during the short summers. The conclusions reached by these writers is so entirely in accordance with all that has come under our own observation in reference to the existence of glaciers, that we do not hesitate in considering their determinations as final. The fact that the winter season in the Far West, for example, is the one that favors the accumulation of snow and the growth of

glaciers, while during the summer these conditions are reversed, seems enough in itself to show that an extension of the winter conditions, from whatever cause, for a greater portion of the year would favor the extension of the present glaciers and the formation of new ones, as well as the increase of the existing lakes and the flooding of valleys that are now arid throughout the year. Prolonging the winter conditions in temperate latitudes would therefore initiate a glacial epoch. This is the more evident as the climatic change necessary to cause an extension of the existing glaciers of the Sierra Nevada so as to approximate to their former magnitude, or the growth of the existing lakes of the Great Basin until they equaled the extent of the Quaternary water surface of the same region, need not be considered as a climatic change of great intensity.

There are no records of the former existence of glaciers within the basin of Lake Lahontan, but the western border of its hydrographic basin was once buried beneath a vast accumulation of snow and ice that covered all the higher portions of the Sierra Nevada. The East Humboldt range, which forms a portion of the eastern border of the same drainage area, was also glacier-crowned. In the central portion of the basin, the Shoshone, Star Peak, and Granite ranges rise to an elevation of about 10,000 feet, and are reported by the geologists of the Fortieth Parallel Exploration to bear evidence of former glaciation about their summits.

The former presence of extensive glaciers on the Sierra Nevada and Wasatch mountains, and of ice fields of less extent on some of the intermediate ranges, is sufficient to prove that during that time all the mountains of the region must have been snow-covered for at least a large portion of each year. This in itself—unless the temperature throughout the year was below freezing—would necessitate the formation of lakes in the inclosed basins between the ranges. In three instances in the Bonneville basin, and at four localities near Mono Lake, the glacial and lake records of Quaternary date overlap. The moraines at the western base of the Wasatch mountains which descend below the level of the Bonneville beach have been described by Mr. Gilbert;⁸⁴ in this instance, however, the relative age of the moraines and lake terraces is indefinite. In the Mono basin a number of

⁸⁴ Second Ann. Rep. U. S. Geol. Survey, p. 189.

glaciers of large size formerly flowed down from the High Sierra, which forms its western border, and deposited moraines of great magnitude, on which the terraces of the Quaternary lake, that formerly filled the basin to the depth of nearly 900 feet, are distinctly traced. The moraines at Mono Lake were carried out into the valley as parallel ridges, or morainal embankments as we have found it convenient to call them, which in several instances are prolonged for a considerable distance below the highest of the ancient beaches, and have terraces traced not only on their outer slopes but on the inner sides of the *couches* formerly occupied by glacial ice. In some instances deltas have been formed between the extremities of the morainal embankments. The proof is therefore conclusive that the greatest extension of the glaciers preceded the maximum rise of the lake. How far the glaciers had retreated up the cañons before the lake occupied their former beds it is impossible to determine. It has also been found that the glaciers of the Mono basin had two or more periods of maximum extension, separated by times when the ice withdrew far up the cañons through which it flowed. There were at least two well-marked glacial epochs in the Sierra Nevada. The lacustral records of the Mono basin indicate two periods of high water, corresponding, it is presumed, to the two main periods of glacial extension. All the facts known to us are in harmony with the conclusion that the two humid periods recorded in the Bonneville and Lahontan basins were practically synchronous with the two periods of maximum extension of the Sierra Nevada glaciers. The fact that the greatest rise of the Quaternary lake occupying Mono Valley occurred after the greatest expansion of the glaciers does not militate against this determination, but indicates that the melting of the snow and ice on the mountains contributed an unusual supply of water to the lake, which then received its greatest flood. When mountains bordering an inclosed basin are loaded with snow and ice, it is evident that a rise of temperature will cause a flooding of the valleys. The analogy between the glacial climate of the Great Basin and the winter climate of the same region at the present time, thus finds another parallel.

The evidence leading to the correlation of the two high-water stages of Lake Lahontan with the two Glacial epochs of the northern hemisphere has already been indicated. Should this conclusion be sustained,

it follows that both series of phenomena resulted from a common climatic change. In the case of Lake Lahontan we have attempted to demonstrate that the change which caused the expansion of the lake was a lowering in the mean annual temperature, and that the periods of desiccation indicate a relative rise of temperature. This interpretation is in harmony with the verdict of the great majority of writers in reference to the prevailing elements in the climate of the Glacial epoch. In former times, as at present, the climate of various regions in the same latitude differed widely in reference to humidity. The more humid regions were the areas of greatest glaciation.

The discussion of the ultimate cause of the cold of the Glacial epoch is beyond the scope of the present report.

A summary of the writer's conclusions in reference to the climatic oscillations indicated by the fluctuations of Lake Lahontan is embodied in the following schedule:

1. Pre-Lahontan arid period.....	Probable climatic conditions... { A time of aridity; precipitation small; evaporation rapid; temperature high. Results { Lakes small, at times desiccated; mountains free from glaciers.
2. First rise of Lake Lahontan ..	Probable climatic conditions... { Precipitation moderate; evaporation decreased; temperature low. Results { Large lakes in the valleys and glaciers in the mountains.
3. Inter-Lahontan arid period ...	Probable climatic conditions... { Decreased precipitation; evaporation rapid; temperature high. Results { Lakes smaller than at present, and at times possibly desiccated; glaciers contracted and possibly completely melted.
4. Second rise of Lake Lahontan.	Probable climatic conditions... { Precipitation moderate, but probably more copious than during the first rise; evaporation decreased; temperature low. Results { Broad lakes and large glaciers.
5. Post-Lahontan arid period	Probable climatic conditions... { A time of great aridity; precipitation small; mean temperature higher than at present. Results { Lakes desiccated and glaciers melted.
6. Present time	Climatic conditions { Precipitation small; evaporation rapid; mean temperature about 50° Fahr. Results { Country arid; rivers small and fluctuating; lakes and glaciers small.

CHAPTER IX.

GEOLOGICAL AGE OF LAKE LAHONTAN.

A review of the facts bearing on the age of Lake Lahontan necessitates some repetition, but seems desirable in order to present the evidence in a connected form.

The reader is already aware that Bonneville and Lahontan were the largest of an extensive series of lakes which formerly occupied the valleys of the Great Basin. That the lakes here indicated—represented for convenience of reference on Plate I—were contemporaneous seems too positive to be questioned. The records in the various basins are identical, consisting of terraces, gravel embankments, sedimentary deposits, fossils, etc., in which no difference of age can be detected. Moreover, the existence of lakes in inclosed basins is dependent on climatic changes too broad in their effect to have been felt in a single valley without producing similar results in others near at hand. That the lakes now under discussion, not only existed at the same time, but were also of a very recent date, is considered as abundantly proven by the fact that they left the very latest of all the completed geological records to be observed in the Great Basin.

The fossil shells obtained from the sediments and tufas of Bonneville and Lahontan, and a few of the smaller sister lakes, all belong to living species. The mammalian remains discovered in the sediments of Lake Lahontan are the same as occur elsewhere in Tertiary and Quaternary strata. The spear head of chipped obsidian obtained in the upper Lahontan sediments is considered good evidence—although as yet unsustained by other finds of a similar character—that man inhabited this continent during the last great rise of the former lake.

The greatest expansion of the waters of the Mono basin, occurred subsequent to the last extension of the Sierra Nevada glaciers. Although this is the only instance known where the relation of the former lakes and glaciers of the Great Basin is clearly determinable, yet it seems a necessary inference that the other lakes of the same region attained their maximum at the same time. As the formation of glaciers and the extension of lakes in inclosed basins necessarily result from similar climatic changes, we correlate the two flood periods of Lake Lahontan with the two periods of maximum extension of the Sierra Nevada glaciers. Again, from similarity of phenomena, the two periods of glaciation on the mountains of the Far West, are correlated in time with the two glacial epochs of northeastern America, as recognized by certain geologists. If this determination is correct, it follows that the last great expansion of the lakes of the Great Basin occurred during the close of the Glacial period, and may be considered as contemporaneous with the Champlain epoch of the eastern States.

That the valleys of the Great Basin held lakes, at least at intervals, throughout the Quaternary, is not only probable, *a priori*, but is indicated by the great thickness of marls, clays and gravels that fill these depressions. In the Bonneville basin these deposits have been penetrated to a depth of over 1,500 feet without reaching the underlying rock. That the lower portion of the material filling these depressions may be of Tertiary age, is certainly possible, but the records of the passage of the Tertiary into the Quaternary are so obscure and so little known that it is at present impossible, at least in the lake-beds of the Far West, to say where the former ends and the latter begins. When Lake Lahontan began its existence will probably never be known, except in a general way; but that it reached its greatest extension in late Quaternary times and was approximately synchronous in its fluctuations with the advance and retreat of the Sierra Nevada glaciers during the Glacial epoch is a fair deduction from the evidence recorded in the present volume.

In regard to the time, as measured in years, that has elapsed since the events described in this report took place, we have but shadowy evidence to offer. It has been estimated by James Croll,⁸⁵ from astronomical data, that

⁸⁵ Climate and Time, New York, 1875. Chap. XIX.

the last Glacial epoch terminated about 80,000 years ago. Other investigators have approached the problem in different ways and reached widely discordant results. At present even an approximate measurement in years of the time that has elapsed since the last great retreat of the glaciers of the northern hemisphere seems impossible. Considering that Lake Lahontan fluctuated synchronously with the advance and retreat of the glaciers during the Glacial epoch, we must conclude that its last evaporation followed the last great retreat of the glaciers. Our studies in the Far West have shown that there is no reason for supposing that the retreat of the Sierra Nevada glaciers was a sudden event, partaking of the nature of a catastrophe, or that the evaporation of the lakes which were supplied by the melting ice, was a matter of a few years. On the contrary, the glaciers are believed to have retreated slowly; with many pauses, and the evaporation of the lakes to have extended through centuries. Even if the Glacial epoch can be proven to have terminated 80,000 years ago, there is no reason for considering that desiccation of the lakes followed that event within many thousand years. As stated at the beginning of this paragraph, we have no definite evidence to show that the Quaternary lakes were flooded a certain number of years since; but one familiar with the shore phenomena displayed in the valleys of the Far West cannot fail to be impressed with the perfection with which these structures have been preserved. In many instances the embankments of gravel are as perfect in contour and as regular in slope as if constructed but a few years ago. Subaërial erosion is reduced to a minimum in such instances, however, for the reason that the structures are porous and absorb nearly all the rain that falls upon them, allowing it to percolate quietly through their interstices. Changes of temperature have but little power to alter their forms, owing to the large size of the interspaces and the readiness with which moisture is removed. The only elements of subaërial erosion to which gravel embankments seem open to attack are the wind and the beating of rain. During the lapse of centuries even these slow processes must effect appreciable changes, but as yet this is scarcely apparent in the embankments built in Lake Lahontan. It is evident that gravel embankments in arid regions, so situated that they are not within the reach of stream erosion, may be considered among the most per-

manent of topographic forms; more constant, in fact, than the rocky mountain tops. It is not surprising, therefore, that the gravel structures fail to give evidence as to their age.

We might consult the cañons carved through Lahontan sediments since the recession of the lake for a time measure; but the amount of erosion here apparent could have been performed by the existing streams in a few years, owing to the unconsolidated character of the strata and the high grade of the streams caused by the lowering of their base level upon the withdrawal of the lake waters. Moreover the streams have meandered but little within their cañons, thus indicating that these trenches have not been long finished. On the whole the cañons indicate that but a brief period has elapsed since their excavation began.

The tufa deposits of the basin have been exposed to erosion since the withdrawal of the lake waters, and might be expected to present some indication of the time they had been subjected to subaërial erosion. These deposits are porous and open in structure and favor the absorption and retention of moisture. They are thus especially liable to the destructive effects incident to the freezing of water in the interspaces of rocks, especially as the rains and frosts of the Great Basin occur together. We may, therefore, expect that the subaërial erosion of the tufa deposits would be rapid, and that if they had been exposed for a long period they would exhibit marked evidence of waste and decay. The fact is, on the contrary, that these deposits are remarkably well preserved. The greater amount of fracture and displacement that has been observed has evidently resulted from the weight of the deposits when left unsupported by the waters in which they were formed. The only conclusion to be drawn from the tufa deposits in reference to the date of the last desiccation of Lake Lahontan is that their time of exposure has been short.

Again, in reference to the shells strewn over many portions of the deserts which, in many cases, must have been left by the evaporation of the former lake, we find that these fossils, or semi-fossils, as they have been termed, are bleached white and have lost their epidermis, but are otherwise frequently as perfect as when inhabited by the mollusk to which they belonged. That these fragile bodies have been drifting about at the caprice

of the winds for thousands of years without being destroyed is improbable, to say the least.

Other facts bearing on the determination of the length of time that has elapsed since the close of the Glacial epoch may be observed in the cañons of the High Sierra, and have been described in part in a previous essay.⁸⁶ We need not consult the moraines left by the ancient glaciers, as these, like the gravel embankments mentioned above, are comparatively stable structures; but in the glaciated cañons there are numerous bosses and domes of granite and quartzite that have been exposed to the sky since the glacial ice was melted from above them. The ice-polish on these ledges is still conspicuous, and causes them to glisten in the sunlight as brilliantly as do similar surfaces adjacent to the existing glaciers of the High Sierra and of Switzerland. These smooth surfaces are still scored with fine hair-like lines, and the eye fails to detect more than a trace of disintegration that has taken place since the surfaces received their polish and striations. Here again we meet with the difficulty of applying quantitative measurements; but as there is a limit to the time that rock surfaces may retain their polish it seems reasonable to conclude that in a severe climate like that of the High Sierra it could not remain unimpaired for more than a few centuries at most.

The cumulative weight of these various lines of inquiry is such as to lead to the *opinion* that the last desiccation of the Quaternary lakes of the Great Basin certainly occurred centuries but probably not many thousands of years ago. On the other hand, it might be argued that the presence of the bones of the mastodon, camel, and horse in the lacustral clays, deposited during the last great rise of the lake, is abundant evidence of the antiquity of that event. The date of the various fluctuations of Lake Lahontan, as measured by the standard used in human history, thus remains an open question.

CHAPTER X.

POST-LAHONTAN OROGRAPHIC MOVEMENTS.

In our sketch of the origin of the Lahontan basin (*ante*, page 24), a brief account of the pre-Quaternary faults of the region was given. As there stated, the area we are studying has been broken by profound fractures, which resulted in the division of the rocks into a great number of orographic blocks. The unequal displacement of these gave origin to the various valleys that were occupied by the Quaternary lake. In the present chapter we wish to direct attention to similar movements of the earth's crust which have taken place since the evaporation of Lake Lahontan.

The traveler in the Great Basin frequently sees low escarpments in lacustral beds and alluvial slopes, which form irregular lines along the bases of the mountains, and at times cross the valleys. In profile, these scarps present various appearances, as illustrated by the following sections. Where they cross alluvial slopes they usually exhibit a profile similar to that shown at *a*. In the open valleys they form a small cliff or steep ascent, joining a

FIG. 36.—Ideal cross-profiles of faulted beds.

horizontal plain below with a similar plain above, as indicated in section at *b*. On a mountain side the scarp is usually partially in rock and partially in alluvium, as represented at *c*. The course of the scarps is always irregular, and sometimes forms zigzag lines that may be followed for many miles.

Julius Bien & Co. Lith.

POST - QUATERNARY FAULT LINES.

Scale: 29 miles = 1 inch

The scarps differ from the steep slopes bounding water-built terraces and embankments—that neither their upper or lower limits are horizontal for any considerable distance; they are characterized by irregularity, and do not define the boundaries between deposits of different character. They occur both above and below the highest beaches of the Quaternary lakes of the region where they are found, and exist in valleys that have a free drainage as well as in those that are inclosed and once held lakes. It is, therefore, evident that their origin is totally independent of the action of waves and currents, and it is equally clear that they cannot be the result of erosion.

Scarps of this nature were first observed in the Great Basin by Mr. Gilbert, while examining the western base of the Wasatch Mountains, and were recognized as the result of recent orographic movements.⁸⁷ In other words, they are fault scarps of very late origin. Their recency is shown by the fact that they commonly occur in Quaternary lacustral sediments and recent alluvial slopes, and form steep slopes of earth and gravel that are but little modified by erosion, and in many instances are bare of vegetation.

In many cases, it is evident that they could not have existed in their present condition for more than a few years. Sometimes they are more than a hundred miles in length, and vary from a few feet to more than a hundred feet in height.

Recent faults of this nature have been observed along the western base of the Wasatch Mountains, at the eastern base of the Sierra Nevada, and on the foot-slopes of many of the intermediate Basin ranges. In the Lahontan area recent fault scarps are a common feature in the topography of the valleys, and furnish one of the many interesting problems in the physical geology of the region.

All of the lines of post-Lahontan displacement that are actually known to exist in the Lahontan basin are sketched on Plate XLIV, with as much accuracy as the topography of the map admits. It is evident that our knowledge of this phenomenon is incomplete, as only the more recent displacements are apt to attract attention, for the reason that when erosion has modified the scarps it is frequently impossible to determine whether post-

⁸⁷ Second Annual Report U. S. Geological Survey, p. 192.

Quaternary movement has taken place or not. Could the full extent of the recent fault lines be indicated on the map, it is probable that they would form a complicated series of intersecting lines that would embrace nearly the entire area.

The first feature of general interest that presents itself upon commencing the study of these recent faults, is that they frequently, if not always, follow the courses of ancient displacements that are usually of great magnitude. They are recent movements of ancient faults.

The intimate association of thermal springs with recent faults is to be noticed not only in the basin of Lake Lahontan, but throughout the entire area of interior drainage thus far explored. It is also to be noticed that the hottest springs almost invariably occur on the lines of displacement that have suffered the most recent movement. So nearly constant is this correlation, that wherever thermal springs occur, other evidences of recent orographic movement are almost always at hand. The suggestion has been advanced in this connection⁸⁸ that the high temperature of the springs is due to the friction of the rocks along the sides of the fault plane. It is the conversion of motion into heat. As, however, the faults result from a profound fracturing of the earth's crust, it is evident that any water which finds its way into a fault may descend to great depths and consequently reach regions of high temperature; it is more than probable, therefore, that the springs derive at least a portion of their heat from the internal heat of the earth. It is impossible at present to determine how much of the heat affecting springs is caused by friction and how much is due to the prevailing high temperature of the earth at great depths. Probably both causes conspire to produce the results observed.

The intimate association of the thermal springs of the Lahontan basin with recent displacements may be illustrated by comparing Plates VIII and XLIV, which will show that but a very few thermal springs occur in this area that are not closely associated with recent faults.

The various lines of recent displacement in the Lahontan basin have so many features in common that it is unnecessary to enter into a detailed description of each. All that are represented on Plate XLIV, within the

⁸⁸ Third Annual Report U. S. Geological Survey, p. 232.

borders of the ancient lake, exhibit scarps in lacustral beds and gravel deposits, and are therefore more recent than the last rise of the lake.

The appearance of the fault at the western base of the West Humboldt range is shown on Plate XLV; the point of view being near the southern end of Humboldt Lake. The precipitous mountain face shown in the picture is in reality an ancient fault scarp of grand proportions, which was somewhat eroded before the existence of Lake Lahontan. During the time the lake occupied Humboldt Valley its waves carved a number of terraces along the base of the mountains, which are represented in the sketch, and are familiar to many who have traveled over the Central Pacific Railroad. Between the highest terrace and the shore of the present lake there is an irregular line of cliffs—in part obscured by talus slopes—which has been produced by recent orographic movement. This fault scarp is composed principally of cemented gravels of Lahontan age, but in places the rock forming the mountains may be seen beneath the clastic beds. The character of the section exposed at many localities along this fault is represented in diagram *c*, Fig. 36. This fault scarp may be traced continuously from the Mopung Hills northward, along the bases of the West Humboldt and Star Peak ranges, to the neighborhood of Winnemucca, a distance of over a hundred miles; its full extent, however, remains to be determined. Throughout the greater part of its course it crosses alluvial slopes, with a fresh scarp from ten to twenty feet, or more, in height, its greatest magnitude being near its southern end. Along the eastern shore of Humboldt Lake it forms a nearly vertical escarpment, fully fifty feet high. At the Mopung Hills it divides into several branches, which may be traced to the border of the Carson Desert, and then become obscured.

In describing the shore phenomena on the Niter Buttes, a spur of the main range, at the southern end of Humboldt Lake (see *ante*, page 112), some account was given of sloping terraces, which indicate that orographic movement must have taken place during inter-Lahontan time. We have evidence, therefore, that the fault along the west base of the West Humboldt range attained a great magnitude previous to the existence of Lake Lahontan, that it underwent some disturbance during inter-Lahontan time, and

has increased its displacement fully fifty feet since the evaporation of the Quaternary lake.

The hot springs at Hot Springs Station, on the Central Pacific Railroad, occur on a line of recent displacement, which may be followed for a few miles, both north and south, from the present site of the springs. Deposits of extinct springs may be seen for a mile or more north of the present point of outflow, indicating that former openings, through which the springs rose, have been filled by calcareous deposits, thus compelling the waters to find other points of egress along the line of fracture.

The recent fault on the east side of the Carson Desert is marked by a low scarp in alluvium, and a change in the drainage where the displacement crosses Alkali Valley. East of Borax Springs, situated in Alkali Valley on the line of fracture, the slope of the desert surface is eastward, and conducts the drainage to the end of the valley where a lake of brine is formed, which on evaporating leaves a deposit of salt of economic importance. Alkali Valley is bordered on all sides by precipitous mountains, excepting where it opens into the Carson Desert, and formed a deep bay during the existence of Lake Lahontan. In passing from the Carson Desert into Alkali Valley no change in the nearly level desert surface is noticeable until the line of faulting is reached; the plain then inclines gently eastward as we have described. It is evident that this inclination of the desert surface has taken place in post-Lahontan times, and is due to a slight tilting of the orographic block on which Alkali Valley is located.

The course of the fault indicated on Plate XLIV, as crossing the northern border of Mason Valley, is rendered conspicuous in the topography of the valley bottom by a scarp from ten to twenty feet high in lacustral marls and clays, and by numerous thermal springs. This is probably a continuation or a branch of a displacement in Walker River Valley which presents a section of Lahontan sediments fully 150 feet high. In common with the majority of the recent displacement of northern Nevada, both ends of this fault are obscure and indeterminable.

What is probably a continuation of the series of disturbances observed in Mason Valley is indicated by a recent scarp along the east base of the Wassuck or Walker Lake range. The influence of this displacement on

the contour of the lake bottom is indicated to some extent by the soundings given on the map forming Plate XV. The lake is deepest in the immediate vicinity of the fault line.

It is probable that the direction taken by Walker River on leaving Mason Valley was determined by orographic movement, as it does not follow what appears to have been its natural course, but the character of this change is difficult to describe. The former outlet of Mason Valley was through a narrow gorge leading to the Carson River which it entered at a point opposite the site of Camp Churchill. This would probably have been the course taken by the stream when the waters of Lake Lahontan were withdrawn for the last time, had not orographic movement caused a slight change in the slope of the valley and thus deflected the river to the right. This phenomenon will be better understood on consulting the accompanying pocket map, where the ancient channel leading from Mason Valley to the Carson River is indicated.

That portion of the great Sierra Nevada fault which defines the western border of Carson and Eagle valleys has undergone a recent displacement of from ten to thirty feet, as is shown by fresh scarps in earth and gravel, and also by the outflow of heated waters at several localities. The recent scarp in this instance has been followed all the way from near Carson City to beyond Genoa; the full extent of the movement, however, far surpasses these limits.

The basin of Lake Tahoe is an orographic valley of the Great Basin type, but is situated at a high altitude in the Sierra Nevada on the border of the interior drainage area. With the exception of the hot springs at the northern end of the lake, no evidence is known to the writer tending to show that there has been recent orographic movement in its immediate vicinity.

The faults along the eastern base of the Pine Forest Mountains; on the western margin of the Black Rock range, from Black Rock point northward, and at the northern base of the Harlequin Hills are all marked in the topography of the country by recent scarps that seldom exceed twenty feet in height. At numerous points along these lines of displacement thermal springs come to the surface.

The large group of hot springs near Ward's ranch, on the western border of the Black Rock Desert, and the group at the east end of Granite Mountain, are both on lines of recent displacement.

The fault that crosses the western border of Smoke Creek Desert differs from most others in the Lahontan basin in the fact that it traverses the valley at a considerable distance from the mountains. Its course is marked by numerous thermal springs, and by a low scarp which at times becomes too indistinct to be easily traced. There is but little question that this line of displacement is a continuation of the fault to be seen at Granite Mountain, which apparently comes to view again along the borders of the Black Rock Desert farther northward. The connection between these various fragmental fault lines has not been traced, and we have represented on Plate XLIV only such portions as have actually been observed. The course of this fault across the southern portion of Smoke Creek Desert is indicated by a low and somewhat rounded scarp with a nearly east and west strike. The springs along the fracture irrigate the desert sufficiently to admit of the growth of grasses and desert shrubs which mark its course by a line of verdure through the absolute waste. Farther northward, in the neighborhood of Sheep Head Spring, the fault changes its course and becomes nearly north and south in its trend; farther northward, still, it bends more to the eastward, and, finally, near Round Hole Spring it has an approximately east and west strike. Its course is thus nearly crescent-shaped, but it has many more irregularities than we are able to represent on the accompanying map. On the line of this fault near Buffalo Springs there are a number of tufa piles rising abruptly from the desert to a height of thirty or forty feet, which exhibit the three varieties of tufa that are characteristic of the Lahontan calcareous precipitates. It is evident that the nuclei of these deposits were formed by subaqueous springs, as described in a previous chapter, thus showing that the fracture along which they are situated must have existed during the time the desert was occupied by the ancient lake. In a few instances the tufa piles situated immediately above the line of fracture have been split from base to summit by a recent orographic movement, and are now parted by vertical fissures two or three feet wide, into

which a person can descend a number of feet lower than the surface of the desert.

The fault described in the last paragraph is at such a distance from the highlands to the westward that no alluviation has taken place in its neighborhood. There has, therefore, been no transfer of load from one side of the displacement to the other. The thrown side of the fault underlies the broad desert and was lightened previous to the last fault-movement by the removal of 500 feet of water from its entire surface. It is quite evident, therefore, from the nature of the facts, that the unequal loading of contiguous orographic blocks, which has been assumed as an explanation of fault movements in certain instances, cannot be considered an element in the present example.

A fault along the northern side of Honey Lake Valley shows about as great an amount of post-Lahontan movement as any in the basin. In this instance the trend of the fault is irregular, but in general its course is northwest and southeast; its hade is nearly perpendicular, and the recent displacement at times exceeds a hundred feet. The thrown block underlies Honey Lake Valley. From the position of the present lake and the direction of drainage in the valley, it seems evident that the mountains between Smoke Creek Desert and Honey Lake Valley must have been upheaved to produce this fault. A similar but more gentle movement of the same mountain mass would account for the recent scarp described above which crosses the Smoke Creek Desert.

The faults represented on Plate XLIV, to the north of the Lahontan drainage area, are of the same character as those already described, and will require but a word of explanation at this time.

The recent displacement on the west side of Surprise Valley, California, has a throw varying from 20 to 50 feet, and may be traced for nearly a hundred miles across alluvial slopes and gravel embankments of Quaternary age. As in numerous other instances, its course is marked by thermal springs, some of which are of high temperature and afford a large volume of water. The fault along the eastern base of the Stein Mountains, Oregon, falls in this same category, and together with other similar displacements

in the same region will be found described briefly in the Fourth Annual Report of the U. S. Geological Survey.⁸⁹

From the studies of the recent displacements of the Lahontan basin which we have been enabled to make, it seems safe to conclude that these orographic movements are but the continuation of a series which had its beginning long previous to the Quaternary. These movements were in progress during the existence of Lake Lahontan, as indicated by sloping terraces, and no less plainly by tufa deposits along lines of fracture. As shown above, the evidence that these movements have been in progress in very recent times is abundant. The character of the phenomena is such that it is impossible to resist the conclusion that the forces which produced the results described are still in action.

Whether the faults have been formed gradually without any marked disturbance, or whether they have been paroxysmal, is not definitely known. That earthquakes are felt from time to time in various parts of the Great Basin, and the results produced by the Owen's Valley earthquake of 1872, tend to the conclusion that the orographic movements have been paroxysmal in their nature.

The Owen's Valley earthquake, it will be remembered, resulted in the formation of a false scarp of the same character as those we have been describing, which may be traced for a number of miles. As reported by Mr. Gilbert, who recently visited Owen's Valley, the main scarp produced in 1872 varies from 10 to 20 feet in height, fades eastward at a high angle, and agrees in all its features with the similar scarps observed throughout the Great Basin. This is apparently the latest slip in the great Sierra Nevada displacement.

In the case of all the recent faults of the Great Basin thus far examined, the movement has been nearly vertical, and but slight crumpling or contortion of the adjacent strata has taken place.

A general view of the phenomena presented suggests that in the majority of instances the blocks now forming the mountains have been raised vertically, while those beneath the valleys remained nearly undisturbed. This hypothesis cannot be sustained by direct proof, however,

⁸⁹ Pages 442-454.

and meets with apparent opposition in the case of the fault along the western border of Walker Lake. In this instance a depression of the thrown block is indicated by the deepening of the waters of the lake as one approaches the line of displacement. As pointed out by Mr. Gilbert, Great Salt Lake has probably been shifted to the eastward of its normal position by orographic movement, which we may consider, at least in part, as the result of a movement of the great Wasatch fault; thus indicating that the thrown side of the displacement was depressed.

By way of a summary of this chapter we may state that the recent faults of the Great Basin have the following characteristics:

They are irregular and angular in their course, in reference to both vertical and horizontal planes.

They occur most commonly on the steeper side of the basin ranges, and, so far as known, invariably hade toward the valley, *i. e.*, the valleys occupy the thrown sides of the displacements.

Their scarps occur in alluvium and in lacustral beds, and cut the embankments and terraces of Quaternary lakes; many times they present fresh slopes of earth and gravel that are unclothed by vegetation, and but little affected by erosion. Occasionally they cross stream-beds and cause rapids; as is the case where the Wasatch fault crosses American Fork, Utah.

At hundreds of localities thermal springs come to the surface along the lines of fracture.

In the majority of instances the recent movement has taken place along ancient lines of displacement; the post-Quaternary fault in such cases is but a small fraction of the entire disturbance.

UNITED STATES GEOLOGICAL SURVEY,
DIVISION OF PALÆONTOLOGY,
NEW HAVEN, CONN., *December* 18, 1884.

SIR:

In compliance with your letter of instructions, dated October 5, 1882, I have the honor to transmit herewith a Monograph of the DINOCERATA, an extinct order of Mammals discovered in the Eocene deposits of Wyoming Territory.

Very respectfully,

Your obedient servant,

O. C. MARSH,
Palæontologist-in-Charge.

HON. J. W. POWELL,
Director of the U. S. Geological Survey,
Washington, D. C.

U. S. GEOLOGICAL SURVEY
WASHINGTON, D. C.
October 12, 1881

Sir:
In compliance with your letter of instructions dated October 2,
1881, I have the honor to transmit herewith a photograph of the
fossils in an extent order of Alameda discovered in the Tertiary
deposits of Wrentham, Vermont.

Very respectfully,

Your obedient servant,

W. L. WALKER,
Geological Survey of Vermont.

Hon. J. W. Powell,
Director of the U. S. Geological Survey,
Washington, D. C.

All the illustrations in the present volume are original, with the exception of nine woodcuts, for which due credit is given on the pages where they are used.

PREFACE.

THE present Memoir is the second of a series of Monographs designed to make known to science the Extinct Vertebrate Life of North America. In the first volume, on the *Odontornithes*, or Birds with Teeth, the author gave the result of his investigations of that remarkable group, which he discovered in the Cretaceous deposits on the Eastern slope of the Rocky Mountains.

This second Monograph contains the full record of a peculiar order of Mammals, which the author also brought to light in the early Tertiary strata of the great central plateau of the continent.

In preparing the present volume, it has been the aim of the author to do full justice to the ample material at his command, and, where possible, to make the illustrations tell the main story to anatomists. The text of such a Memoir may soon lose its interest, and belong to the past, but good figures are of permanent value in all departments of Natural Science. What is now especially needed in Palæontology is, not long descriptions of fragmentary fossils, but accurate illustrations of characteristic type specimens. In the fifty-six lithographic plates, and nearly two hundred original woodcuts, in the present volume, it is believed that this requirement is fairly met; since all the more important specimens of the *Dinocerata* now known are represented, and at least one figure is given of every species.

The same general plan will be followed in the third Monograph, on the *Sauropoda*, which comes next in the series, and is now approaching completion. Ninety lithographic plates, and a large number of woodcuts, will be used to illustrate it. The fourth volume, on the *Stegosauria*, which follows, will likewise be very fully illustrated. A great portion of the lithographic plates to accompany it are finished, and part of them are already printed. Other monographs of the series, now in preparation, will appear in due time.

To General Sheridan and General Sherman of the United States Army, the author's best thanks are due for important assistance in his Western explorations, during which the discoveries here recorded were made. Other officers of the Army, who commanded his escort, and aided him in many ways, also deserve grateful acknowledgments.

For direct aid in collecting the specimens on which the present volume is based, the author is indebted to the members of the Yale College expeditions, which explored so successfully many portions of the Western Territories.

The thanks of the author are especially due to Mr. Oscar Harger, assistant in the Yale Museum, for valuable aid in the field, and in the preparation of the present memoir. Messrs. S. W. Williston, G. Baur, and M. Schlosser, also his assistants, have likewise aided, especially while the volume was passing through the press.

YALE COLLEGE, New Haven, Conn., December 15th, 1884.

INTRODUCTION.

AMONG the many extinct animals discovered in the Tertiary deposits of the Rocky Mountain region, none, perhaps, are more remarkable than the huge mammals of the order *Dinocerata*. Their remains have hitherto been found in a single Eocene lake-basin in Wyoming, and none are known from any other part of this country, or from the Old World. These gigantic beasts, which nearly equalled the elephant in size, roamed in great numbers about the borders of the ancient tropical lake in which many of them were entombed.

This lake-basin, now drained by the Green River, the main tributary of the Colorado, slowly filled up with sediment, but remained a lake so long that the deposits formed in it, during Eocene time, reached a vertical thickness of more than a mile. The Wasatch Mountains on the West, and the Uinta chain on the South, were the main sources of this sediment, and still protect it, but the Wind River range to the North, and other mountain elevations, also sent down a vast amount of material into this great fresh-water lake, then more than one hundred miles in extent.

At the present time, this ancient lake-basin, now six to eight thousand feet above the sea, shows evidence of a vast erosion, and probably more than one-half of the deposits once left in it have been washed away, mainly through the Colorado River. What remains forms one of the most picturesque regions in the whole West, veritable *Mauvaises terres*, or bad lands, where slow denudation has carved out cliffs, peaks, and columns of the most fantastic shapes, and varied colors.

This same action has brought to light the remains of many extinct animals, and the bones of the *Dinocerata*, from their great size, naturally first attract the attention of the explorer.

The first remains of the *Dinocerata* discovered were found by the author, in September, 1870, while investigating this Eocene lake-basin, which had never before been explored. Various remains of this group were also collected by other members of the expedition, and among the specimens thus secured was the type of *Tinoceras anceps*, described by the author in the following year, and now more fully in the present volume. In the same geological horizon with these remains, a rich and varied vertebrate fauna, hitherto unknown, was found.

Among the animals here represented were ancestral forms of the modern horse and tapir, and also of the pig. Many others were found related to the recent Lemurs; also various Carnivores, Insectivores, Rodents, and small Marsupials; and of still more importance, remains were here brought to light of another new order of mammals, the Tillodonts, quite unlike any now living. Crocodiles, tortoises, lizards, serpents, and fishes also swarmed in and about the waters of this ancient lake, while around its borders grew palms, and other tropical vegetation.

A later Eocene lake-basin, south of the Uinta Mountains, was discovered, in October, 1870, by the same expedition, and named by the author Uinta basin. In the attempt to explore it, our party endured much hardship, and also were exposed to serious danger, since we had only a small escort of United States soldiers, and the region visited was one of the favorite resorts of the Uinta Utes. These Indians were then, many of them, insolent and aggressive, and since have been openly hostile, at one time massacring a large body of government troops sent against them. Two subsequent attempts by the author to explore this basin met with little success. This lower lake was of upper Eocene age, and its extinct fauna appears to correspond more nearly to that of the Paris basin than any other yet discovered in this country.¹

¹ Some results of this Expedition may be found in an article by the author on the "Geology of the Eastern Uintah Mountains," American Journal of Science and Arts, vol. i, p. 191, March, 1871.

The remarkable Eocene basin North of the Uinta Mountains, where alone the *Dinocerata* had been found, offered so inviting a field for exploration, that in the spring of the following year, 1871, the author began its systematic investigation. An expedition was again organized, with an escort of United States soldiers, and the work continued during the entire season. Among the very large collections thus secured, were numerous specimens of the *Dinocerata*, which furnished important characters of the group.

FIG. 1.

MAP SHOWING REGION OF DINOCERAS BEDS.

In the succeeding spring, 1872, the explorations in this region were continued, and soon resulted in the discovery of the type specimen, including the skull and a large portion of the skeleton, of *Dinoceras mirabile*, and on this new genus the author based the order *Dinocerata*.

Other important specimens, obtained at this time, and described by the author, were the types of *Dinoceras lucare*, *Tinoceras grande*, *Tinoceras lacustre*, and others of scarcely less interest.

In the following season, 1873, the author organized another large expedition, with government escort, and made a very careful examination of the regions in this same basin that remained unexplored. One of the specimens of special importance thus secured was the type of *Dinoceras laticeps*, with the skull and lower jaw nearly complete. Many other individuals of the *Dinocerata* were also discovered, and the abundant material then collected was sufficient to clear up most of the doubtful points in this group.

The research was continued systematically during the next season, also, 1874, and again in 1875, with good results. Since then, various small parties, at different times, have been equipped and sent out by the author to collect in this basin; and, finally, during the entire season of 1882, the work was vigorously prosecuted under the direction of the author, and, from July of that year, under the auspices of the United States Geological Survey.

The specimens thus brought together by all these various expeditions and parties are now in the museum at Yale College, and represent more than two hundred individuals of the *Dinocerata* alone. Of these, not less than seventy-five have portions of the skull more or less perfectly preserved, and in more than twenty it is in good condition. The present volume is based on this material, amply sufficient, it is believed, to illustrate all the more important parts of the structure of this remarkable group.

The remaining material of the *Dinocerata*, now known, consists of a few specimens collected by Dr. Leidy in 1872, including the type of the genus *Uintatherium*; various remains secured in the same year by Prof. Cope, to which he applied the names *Loxolophodon* and *Eobasileus*, with a later acquisition, called *Bathyopsis*; and a number of specimens more

recently obtained by parties from Princeton College. Although these remains show few, if any, characters of the *Dinocerata* not better represented in the larger collection of the Yale Museum, full references to the more important specimens, in most cases with illustrations, are given in the present memoir, especially in the Synopsis at the end of the volume.

The *Dinocerata* have hitherto been found in a well marked geological horizon of the middle Eocene. The relations of this horizon to other deposits of Tertiary age are important, and cannot readily be understood without having in mind the principal changes that took place in the geology of the Rocky Mountain region during this period. These changes and their results may be briefly stated as follows:

The Tertiary of Western America comprises the most extensive series of deposits of this age known to geologists, and important breaks in both the rocks and the fossils separate it into three well-marked divisions. These natural divisions are not the exact equivalents of the Eocene, Miocene, and Pliocene of Europe, although usually so considered, and known by the same names; but, in general, the fauna of each appears to be older than that of its corresponding representative in the other hemisphere; an important fact, but little recognized. This partial resemblance of our extinct faunas to others in regions widely separated, where the formations are doubtless somewhat different in geological age, is precisely what we might expect, if, as was probable, the main migrations took place from this continent. It is better at once to recognize this general principle, rather than attempt to bring into exact parallelism formations that were not contemporaneous.

The fresh-water Eocene deposits of our Western Territories, which are in the same region at least two miles in vertical thickness, may be separated into three distinct subdivisions. The lowest of these, resting unconformably on the Cretaceous, has been termed the Vermilion Creek, or Wasatch, group. It contains a well-marked mammalian fauna, the

largest and most characteristic genus of which is the ungulate *Coryphodon*, and hence the author has called these deposits the *Coryphodon* beds. The middle Eocene strata, which have been termed the Green River and Bridger series, has been designated by the author the *Dinoceras* beds, as the gigantic animals of this order are only found here. It is, however, better to separate the Green River series, under the term *Heliobatis* beds, and this is done in the present volume. The name *Dinoceras* beds will then apply to the Bridger series alone. The uppermost Eocene, or the Uinta group, is especially well characterized by large mammals of the genus *Diplacodon*, and hence termed by the author *Diplacodon* beds. The fauna of each of these three subdivisions was essentially distinct, and the fossil remains of each were entombed in different and successive ancient lakes.

It is important to remember that these Eocene lake-basins all lie between the Rocky Mountains on the east and the Wasatch Range on the west, or along the high central plateau of the continent. As these mountain chains were elevated, the inclosed Cretaceous sea, cut off from the ocean, gradually freshened, and formed these extensive lakes, while the surrounding land was covered with a luxuriant tropical vegetation, and with many strange forms of animal life. As the upward movement of this region continued, these lake-basins, which for ages had been filling up, preserving in their sediments a faithful record of Eocene life-history, were slowly drained by the constant deepening of the outflowing rivers, and they have since remained essentially dry land.

The Miocene lake-basins are on the flanks of this region, where only land had been since the close of the Cretaceous. These basins contain three faunas, nearly or quite distinct. The lowest Miocene, which is found east of the Rocky Mountains, alone contains the peculiar mammals known as the *Brontotheridæ*, and these deposits have been called by the author the *Brontotherium* beds. The strata next above, which represent the middle Miocene, have as their most characteristic fossil the genus *Oreodon*, and are known as the *Oreodon* beds. The upper Miocene, which occurs in Oregon, is of great thickness, and from one of its most important fossils, *Miohippus*, has been designated as the *Miohippus* series. The climate here during this period was warm temperate.

SECTION TO ILLUSTRATE VERTEBRATE LIFE IN AMERICA.

Above the Miocene, east of the Rocky Mountains, and on the Pacific coast, the Pliocene is well developed, and is rich in vertebrate remains. The strata rest unconformably on the Miocene, and there is a well-marked faunal change at this point, modern types now first making their appearance. For these reasons, we are justified in separating the Miocene from the Pliocene at this break; although in Europe, where no great break exists, the line seems to have been drawn at a somewhat higher horizon. Our Pliocene forms essentially a continuous series, although the upper beds may be distinguished from the lower by the presence of a true *Equus*, and some other existing genera. The Pliocene climate was similar to that of the Miocene. The Post-Pliocene beds contain many extinct mammals, and may thus be separated from recent deposits.¹

With this introduction, the table of strata on page 7 will make clear the general position of the geological horizon in which the *Dinocerata* are found, and especially its relation to other deposits of Tertiary age. To make the subject clearer to the general reader, the section is enlarged to include the whole geological series. The names applied to the different horizons, some used here for the first time, are, in general, those of the most important vertebrates found in each, and the section thus becomes a condensed index of vertebrate life in America.

The localities in which the *Dinocerata* have been found are on both sides of the Green River, and mainly south of the Union Pacific Railroad, in Wyoming. Of two hundred individuals in the Yale Museum, about equal numbers were found east and west of this River, the distance between the extreme localities in this direction being more than one hundred miles. The map on page 3 covers this region, and the more important localities referred to in the volume are there indicated.

¹ For a more complete presentation of this subject, see the author's address on the *Introduction and Succession of Vertebrate Life in America*, delivered before the American Association for the Advancement of Science, at Nashville, Tenn., Aug., 1877.

The remains of the *Dinocerata* are imbedded usually in indurated clays, gray or green in color, but sometimes they are found in hard sandstone. The series of strata enclosing them are at least five hundred feet in thickness in the same region, and all taken together are probably one thousand feet.

Among the fossils found associated with the *Dinocerata* are *Limnohyus* and *Palæosyops*, two genera of perissodactyl ungulates. They were somewhat larger than a Tapir, and in these strata are next in size to the *Dinocerata*. One or the other of these genera occurs wherever the *Dinocerata* have yet been found, but the remains extend through a greater thickness of strata than those of the former group. Another genus of ungulates in this horizon is *Orohippus*, a four-toed ancestor of the horse. Other prominent genera are *Colonoceras*, *Helaletes*, and *Hyrachyus*, related distantly to the Tapir and Rhinoceros.

Two genera, *Tillotherium* and *Stylinodon*, also found here, represent a remarkable order, named by the author, *Tillodontia*. They were nearly as large as a Tapir, and possessed characters resembling the Ungulates, the Carnivores, and the Rodents.

Among the Carnivores, the most formidable was *Limnofelis*, nearly as large as a lion, *Oreocyon*, of almost equal size, *Dromocyon*, somewhat smaller, and *Limnocyon*, about as large as a fox. Among the Lemuroid forms were *Hyopsodus* and *Lemuravus*, forming the family *Lemuravidae*, and having some affinities with the South American Marmosets.

In addition to these, there were Marsupials, Insectivores, Chiroptera, and many Rodents, but apparently no true Quadrumana, or Edentates.

Besides these Mammals, there were numerous Reptiles, especially crocodiles, turtles, lizards, and serpents, in great numbers. Fishes were also abundant, especially the genera *Amia* and *Lepidosteus*.

The *Dinocerata* form a well marked order in the great group of *Ungulata*. In some of their characters, they resemble the Artiodactyls (*Paraxonia*); in others, they are like the Perissodactyls (*Mesaxonia*); and

in others still, they agree with the Proboscidiens. The points of similarity, however, are in most cases general characters, which point back to an earlier, primitive, ungulate, rather than indicate a near affinity with existing forms of these groups. This subject will be more fully discussed in the concluding chapters of the present memoir.

The *Dinocerata*, so far as now definitely known, may be placed in three genera, *Dinoceras*, Marsh, *Tinoceras*, Marsh, and *Uintatherium*, Leidy. The type specimen of *Uintatherium* was discovered near the base of the series of strata containing the remains of the *Dinocerata*. *Dinoceras*, so far as known, occurs only at a higher horizon, while *Tinoceras* has been found at the highest level of all. The characters of these three genera correspond in general with their geological position. *Uintatherium* appears to be the most primitive type, and *Tinoceras* the most specialized, *Dinoceras* being an intermediate form. The material at hand for determining the characters of the two latter forms is abundant, but in regard to *Uintatherium*, some important points relating both to the skull and skeleton still remain in doubt.

The number of species of the known *Dinocerata* is a difficult matter to determine, especially as the limitations between species are now generally regarded as uncertain. About thirty forms, more or less distinct, are recognized in the Synopsis at the end of the volume. The number might easily be increased, if fragmentary specimens were used as the basis for specific names.

DINOCERATA.

CHAPTER I.

THE SKULL.

(Plates I-XIX, LV, and LVI.)

The skull of *Dinoceras mirabile*, the type of the genus *Dinoceras*, on which the order *Dinocerata* was based, is, fortunately, the most perfect in preservation of any yet discovered in this group. It has in addition the great advantage for study of having belonged to an animal fully adult, but not so old as to have the more important sutures of the skull obliterated. It was, moreover, imbedded in so soft a matrix that the brain-cavity and the foramina leading from it could be worked out without difficulty.

In removing the skull from the rock, on the high and almost inaccessible cliff where it was found, two or three important fragments were lost, but the author subsequently made a systematic and laborious search, and recovered them from the bottom of a deep ravine where they had been washed down and covered up.

In its present nearly perfect condition, this skull is well adapted to show the typical characters of this part, both in the genus it represents, and in the order *Dinocerata*, and it will be largely used for this purpose in the following pages. The fact that a considerable portion of the skeleton, also, was found with this skull makes the individual especially worthy to be a type.

The number of this specimen, in the Catalogue of the Yale Museum, is 1036, and in the following pages this number will be used to distinguish this type from other individuals of the same species. Other important specimens will likewise be designated by their catalogue numbers.

The skull of *Dinoceras mirabile* is long and narrow, the facial portion being greatly produced. The basal line, extending from the end of the premaxillaries along the palate to the lower margin of the foramen magnum, is nearly straight. The top of the skull supports three, separate, transverse pairs of osseous elevations, or horn-cores, which form its most conspicuous feature, and suggested the name of the genus. The smallest of these protuberances are situated near the extremity of the nasals; two others, much larger, arise from the maxillaries, in front of the orbits; while the largest are mainly on the parietals, and are supported by an enormous crest, which extends from near the orbits entirely around the lateral and posterior margins of the true cranium. These general characters are well shown in Plate I, which represents the skull of the type specimen.

There are no upper incisors, but the canines in the male are enormously developed, forming sharp, trenchant, decurved tusks, which were each protected by a dependent process on the lower jaws. The premolar and molar teeth are very small.

The orbit is large, and confluent with the temporal fossa. The latter is of great extent posteriorly, but the zygomatic arches are only moderately expanded. There is no post-orbital process, but in *Dinoceras mirabile*, and in some other species, there is a prominence on the frontal bone, directly over the orbit.

THE NASAL BONES.

The nasal bones are greatly elongated, being nearly half the length of the entire skull. They project forward over the anterior nares, and overhang the premaxillaries. They are thick and massive bones, especially in front, and are united together by a nearly straight suture.

In specimens not fully adult, this suture remains an open fissure, and even in some adults it is not closed, especially in the anterior part.

The osseous prominences on the extremity of the nasal bones are their most marked feature. These vary much in form and size in the different genera of the group, and appear to be characteristic of the species.

FIGURE 3.—Nasals of *Dinoceras mirabile*, Marsh (No. 1036); type specimen.

FIGURE 4.—Nasals of *Dinoceras distans*, Marsh (No. 1601); young male.

FIGURE 5.—Nasals of *Tinoceras pugnax*, Marsh (No. 1044).

FIGURE 6.—Nasals of *Tinoceras annectens*, Marsh (No. 1043).

a. side view; *b.* top view; *c.* front view.

All the figures are one-fifth natural size.

In *Dinoceras*, they are small and sessile, and are directed upward, and somewhat outward; in *Tinoceras* they are larger, in most specimens, and project more horizontally, usually not beyond the apex of the nasals. Some of the characteristic forms of these nasals are given above, figures 3-6, page 13, and others will be found under the different species in the Synopsis at the end of the volume.

On their lateral margins, the nasal bones unite by suture with the superior branch of the premaxillary, and, behind this, with the maxillaries up to the point where they join the frontals. These lateral sutures disappear in old animals, but are shown in the skull of *Dinoceras mirabile*, figured in Plate IV. Between the osseous protuberances, or horn-cores, of the maxillaries, the nasals thicken into a transverse ridge, which greatly strengthens the skull in this region. The development of this ridge varies in different species. The suture between the nasals and maxillaries thus appears to rise on the inner face of each maxillary prominence, but the nasals do not form any essential part of these elevations. From this transverse ridge, the nasals expand posteriorly, and meet the frontals by oblique sutures, converging behind to the median line. At the union with the frontals, the nasal bones are comparatively thin.

On their under surface, the nasal bones are each excavated by a broad deep groove, which is separated from its fellow by a sharp median ridge. These grooves extend from the anterior nasal opening back to the frontal bones, and then expand into large cavities immediately in front of the olfactory lobes of the brain. These olfactory chambers differ in form and size in different species. This part of the skull is shown in the sections represented in figures 30-33, pages 29 and 30.

PRE-NASAL BONES.

The anterior extremity of the nasal bones, in both *Dinoceras* and *Tinoceras*, is formed of an osseous projection, pointing forward and downward, and situated in front of and below the nasal protuberances. Several specimens in the Yale Museum show that this projection is formed

of two separate ossifications, each in front of its respective nasal bone. In figure 5, page 13, they are shown in position, with the sutures uniting them to the nasals, and to each other. These bones are a peculiar feature in the skull of *Dinocerata*, and may be called the pre-nasal bones. In very young animals, they are unossified; in adult animals, they are distinct, as in the specimen figured; but in very old animals they become co-ossified with the nasals, and with each other.

FIGURE 7.—Skull of *Dinoceras mirabile*, Marsh (No. 1036); with brain-cast in natural position; seen from above.

FIGURE 8.—The same view of a young specimen of *Dinoceras distans*, Marsh (No. 1601).

f. frontal bone; m. maxillary bone; m'. maxillary protuberance; n. nasal bone; n'. nasal protuberance; p. parietal bone; p'. parietal protuberance; pm. premaxillary bone; s. supra-occipital crest.

Both figures are one-eighth natural size.

When separate, they are subquadrate in form, flattened on the median line where they meet each other; and rugose posteriorly, for sutural union with the nasals. These pre-nasal bones appear to be homologous with the ossicle sometimes found at the extremity of the snout in suillines, especially in the genus *Sus*.

FRONTAL BONES.

The frontal bones in *Dinoceras mirabile* are shorter than the nasals. In all of the known skulls of the *Dinocerata*, the median suture uniting the two frontals is entirely obliterated. The sutures joining them with the nasals in front, and with the maxillaries on the side, is distinct in the type

FIG. 9.

FIG. 10.

FIGURE 9.—Skull of *Tinoceras ingens*, Marsh (No. 1041); with brain-cast in position; seen from above.FIGURE 10.—Same view of skull of *Dinoceras distans*, Marsh (No. 1235).

f. frontal bone; *m.* maxillary bone; *m'.* maxillary protuberance; *n.* nasal bone; *n'.* nasal protuberance; *p.* parietal bone; *p'.* parietal protuberance; *pm.* premaxillary bone; *s.* supraoccipital crest.

Both figures are one-eighth natural size.

of *Dinoceras mirabile*, as shown in Plates II and IV. In this specimen, there appeared to be indications of a suture uniting the frontals with the parietals, which indicated that the former bones were very short, and the latter very long. The fortunate discovery, however, of a very young individual of this genus has cleared up this point beyond doubt.

In this young specimen, the fronto-parietal suture is still open, and passes in a nearly straight line across the top of the cranium just in front of the summit of the cerebral hemispheres. It also divides the posterior elevations, or horn-cores, so as to leave the anterior part of them on the frontals, and the posterior and highest portion on the parietals. In all the other known specimens, this suture is nearly or quite obliterated, but distinct traces of it are seen in several crania in the Yale Museum.

FIGURE 11.—Skull of *Uintatherium latifrons*, Marsh (No. 1231); seen from above.

FIGURE 12.—Same view of skull of *Tinoceras vagans*, Marsh (No. 1241).

f. frontal bone; m. maxillary bone; m'. maxillary protuberance; n. nasal bone; n'. nasal protuberance
p. parietal bone; p'. parietal protuberance; pm. premaxillary bone; s. supraoccipital crest.

Both figures are one-eighth natural size.

The position of this suture, and also that uniting the frontals with the nasals, and the latter with their adjoining bones, is well shown in figure 8, page 15, which represents the young specimen (number 1601) above referred to.

In *Dinoceras mirabile* (number 1036), the frontals are comparatively thin in front where they join the nasals. Over the orbits, they become

thicker, and swell into a distinct prominence, which afforded protection to the eye below. From this point back to the posterior protuberances, or horn-cores, the lateral margin of the frontal is thickened into a strong crest, which rises nearly to the summit of the elevations, leaving a distinct notch where they terminate. This depression marks the position of the fronto-parietal suture, here entirely obliterated.

On the side of the cranium, the frontal bones are bounded anteriorly by the maxillary above, and, lower down, by the lachrymal, as shown in Plate II. Further back on the top of the skull, the frontals are depressed, forming a deep concavity, the lowest portion of which is usually in front of the brain-case. In the posterior portion of the frontals, there are numerous air cells, which materially lighten these bones in this part of the cranium.

THE PARIETAL BONES.

In all of the crania of the *Dinocerata* examined, the parietal bones are firmly united to each other on the medial line, and with the supra-occipital behind. In the single young specimen already mentioned (number 1601), the anterior border of these bones is distinctly marked by sutures, as shown in figure 8, page 15. The large posterior protuberances, or horn-cores, are thus mainly on the parietal bones, and the lateral crest, behind these elevations, appears to be also composed of the parietals. These bones are thick and massive, especially over the brain-case, but like the frontals are lightened somewhat by air cavities, as shown in figure 35, page 31. Between the osseous elevations, or horn-cores, on the parietals, there is a distinct transverse ridge, which strengthens this part of the cranium, and partially divides into two portions the deep concavity enclosed by the lateral and posterior crests. On the sides of the cranium, the parietals form the upper portion of the large temporal fossæ. The suture between the parietal and squamosal below may often be distinctly made out, as shown in Plate II. The share of the parietals in the lofty occipital crest, cannot, at present, be determined with certainty, as here, even in the youngest specimens known, the sutures are obliterated.

THE OCCIPUT.

The occipital region in all the known *Dinocerata* is large, elevated, and subquadrate in outline. It varies much in shape and size in the different genera and species, and several of the principal forms are represented below in figures 13–18.

FIG. 13.

FIG. 14.

FIG. 15.

FIG. 17.

FIG. 16.

FIG. 18.

FIGURE 13.—Posterior surface of skull of *Dinoceras mirabile*, Marsh (No. 1036).

c. occipital condyle; f. foramen magnum; l. lateral crest; o. occipital crest; p. post-tympanic process; t. crest behind temporal fossa.

All the figures are one-eighth natural size.

In *Dinoceras mirabile* (number 1036), the occiput is remarkably rectangular in outline, as shown above in figure 13. Its general surface is concave, for the attachment of the powerful muscles and

ligaments which supported the head. The lofty occipital crest extends upward and backward, overhanging the occipital condyles, when the skull is in a horizontal position. The posterior margin of the large temporal fossa also extends well backward, forming the side of the occipital concavity, which is partially divided into two equal portions by a median vertical ridge. In some species, this ridge is very distinct, but, in others, it is almost entirely wanting.

The occipital condyles are large, and bounded externally in front and below by a deep groove. They project downward and backward, showing that the head was declined when in its natural position.

In *Dinoceras laticeps* (number 1039), the occiput is less elevated, and more expanded transversely, figure 14, page 19. Its concavity is divided into two portions by a distinct median vertical ridge. The foramen magnum, also, is expanded transversely, and is of moderate size. The occipital condyles are more elevated than in *Dinoceras mirabile*, a line joining their upper margins passing entirely above the foramen magnum.

In *Dinoceras agreste* (number 1221), a third type of occiput is seen, much more expanded above, as shown in figure 15, page 19. The foramen magnum is here subtriangular in outline, and the occipital condyles are placed similarly to those of *Dinoceras mirabile*.

In the genus *Tinoceras*, two distinct types of occiput are represented in the Yale Museum. In *Tinoceras ingens* (number 1041), the occiput is greatly elevated, somewhat concave above, and expanded at the sides. There is no median crest. The foramen magnum is triangular in outline, and comparatively small, with its upper border lower than the superior margins of the occipital condyles, as seen in figure 17, page 19.

In *Tinoceras pugnax* (number 1044), the occiput is less elevated, and more nearly quadrate in outline. The foramen magnum is large, and transversely expanded. The occipital condyles extend above its upper margin, as shown in figure 18, page 19. In other species of the *Dinocerata*, the occiput shows an equal variety of forms.

In *Dinoceras mirabile* (number 1036), there is a small, but distinct, par-occipital process of the ex-occipital, directed downward and outward.

In the type of *Uintatherium*, this process appears to be nearly obsolete. In front of this process is the suture uniting the ex-occipital directly with the squamosal, thus excluding the mastoid from the external surface of the skull, as in *Rhinoceros*. The tympanic portion of the periotic, also, does not reach the external surface.

FIG. 19.

FIG. 20.

FIG. 21.

FIGURE 19.—Side view of skull of *Tinoceras pugnax*, Marsh (No. 1044).

FIGURE 20.—Anterior part of skull of *Tinoceras grande*, Marsh (No. 1040).

FIGURE 21.—Anterior part of skull of *Tinoceras annectens*, Marsh (No. 1043).

m'. maxillary protuberance; me. external auditory meatus; n'. nasal protuberance; o. occipital condyle; p'. parietal protuberance; pm. premaxillary bone; pn. prenasal ossicle.

All the figures are one-eighth natural size.

THE SQUAMOSAL BONES.

The squamosal forms the lower portion of the temporal fossa, and sends down a massive post-glenoid process (Plate II, *s*), which bounds in front the external auditory meatus. The latter has for its posterior border the post-tympanic process of the squamosal, which unites directly with the par-occipital process by close suture.

The periotic and tympanic bones are co-ossified, but not with the squamosal. The periotic has a distinct floccular fossa on its inner side. The tympanic is small, and is not expanded into a distinct bulla.

The squamosal sends forward a strong zygomatic process, which resembles that in *Tapirus*. This process overlaps the malar, uniting to it by a straight, horizontal, suture, which, in very old animals, may nearly or quite disappear.

THE MALAR BONES.

The malar bone completes the anterior portion of the zygomatic arch, extending to the front of the orbit, as shown in Plate II, *ma*. The suture uniting the malar with the maxillary remains distinct till adult life, and may usually be traced, even in old animals. This forward extension of the malar bone is a general ungulate character, and quite different from what is seen in the Proboscidiens, where the malar forms the middle portion only of the zygomatic arch. Union of malar with zygomatic process.

THE LACHRYMAL BONES.

The lachrymal is large, and forms the anterior border of the orbit, as shown in Plate II, *l*. It is perforated by a large foramen. In *Dinoceras*, this opening is well within the orbit. In some species of *Tinoceras*, it is outside the orbit. The base of the lachrymal is excavated for the posterior opening of the large antorbital foramen.

THE MAXILLARIES.

In all the *Dinocerata*, the maxillary bones form a large portion of the lateral surface of the skull. They contain all the teeth, except those of the lower jaw, and also expand into the large median pair of osseous elevations, or horn-cores. On the external lateral surface, the maxillaries unite above with the frontals by suture; below this, with the lachrymals, and further down with the malar. This is well shown in the figure of *Dinoceras mirabile*, Plate II, *m*. In front, the maxillaries unite with the pre-maxillaries by a nearly straight, and nearly vertical, suture. Above, they join the nasals, as already described.

The large canine tusk is entirely enclosed in the maxillary, and in the genus *Dinoceras* its root extends upward into the base of the maxillary horn-core. In all known *Dinocerata*, there is a diastema between the upper canine and the pre-molars. The latter are small, and form with the molars a continuous series. On their inner surface, the maxillaries send in strong palatine plates, which meet on the median line. The maxillary is perforated by a large antorbital foramen, the outlet of which is concealed, in the side view of the skull, by a ridge extending upward in front of the orbit. Its position is shown in figures 22-24, *c*, page 25.

THE PREMAXILLARIES.

The premaxillary bones are edentulous, and, even in young specimens, contain no teeth. These bones have three distinct branches, the largest of which extends well forward below the anterior nasal opening. The second branch also extends forward above this opening, forming with the nasal its superior border, as shown in the type of *Dinoceras mirabile*, Plate II, *pm*. The third branch is a horizontal plate extending inward to the median line, where it joins its fellow, and thus completes the anterior portion of the palate.

The anterior free portions of the premaxillaries are well separated on their palatal surface, but these bones meet somewhat in front of the anterior

palatal foramina. Near this point, the palatine plates are united by suture on the median line, and this suture is continued backward along the palate until it meets with the median suture between the maxillaries. The anterior palatine foramina are narrow fissures, rounded in front, and separating the lateral portions of the premaxillaries from the palatine plates, as in *Equus*. The latter plates unite posteriorly by suture with the adjoining maxillaries, as shown in Plate V, *pm*.

The premaxillaries vary much in form in the different genera and species of *Dinocerata*. Two of the principal forms in the genus *Dinoceras* are shown in figures 26 and 27, page 26, and two of the genus *Tinoceras*, in figures 28 and 29, on page 27.

THE PALATE.

In all the *Dinocerata*, the palate is very narrow, and much excavated, especially in front. The bony palate extends back as far as the last upper molar, and in some specimens beyond it. Each maxillary articulates with the corresponding premaxillary by a suture commencing on the palatal surface, in front of the large canine alveolus, and running just within the border of the alveolus to near the middle of its inner margin. At this point, the suture turns inward, across the end of the main branch of the premaxillary, and then obliquely backward, along the posterior end of its palatine plate. The median suture is continued backward, separating the maxillaries, to a point nearly opposite the middle of the penultimate molar, where the maxillaries join the palatines. The maxillo-palatine suture is at first transverse, extending across the palate nearly to the alveolar border of the maxillary, and is then continued backward near this border, and around behind the last molar, whence it turns outward, and ascends the side of the skull in the orbital region.

The palatal surface of each maxillary is deeply excavated in front between the canines, along the diastema, and as far back as the second or third premolar; but on the median line these bones meet in a sharp ridge, nearly on a level with the outer opposite border of the maxillaries.

All the figures are one-fifth natural size.

The bony palate is thus deeply excavated on each side in the region of the diastema, and near the posterior part of each excavation on either side is situated a large foramen, which may be called the palato-maxillary foramen. This foramen is shown in Plate V, and also in figures 22-24, *b*, page 25. The same foramen is seen, also, in the hippopotamus.

FIG. 27.

FIG. 26.

FIGURE 26.—Skull of *Dinoceras mirabile*, Marsh (No. 1036); seen from below.FIGURE 27.—Skull of *Dinoceras laticeps*, Marsh (No. 1039); same view.

Both figures are one-eighth natural size.

The palatine surface of the maxillary bone is perforated with small foramina, along the line of the enclosed canal, as in the hippopotamus, evidently for the transmission of blood-vessels and nerves to the gums and surface of the palate.

The maxillary bones contain the sockets of all the upper teeth. The socket for the canine is a large and deep cavity, elongate-oval in section, and extending upward and backward to the posterior part of the base of the large maxillary protuberance. The outer surface of the maxillary

FIG. 28.

FIG. 29.

FIGURE 28.—Skull of *Tinoceras ingens*, Marsh; seen from below.FIGURE 29.—Skull of *Tinoceras pugnax*, Marsh; same view.

a. anterior palatine foramen; *b.* palato-maxillary foramen; *c.* antorbital foramen; *d.* posterior palatine foramen; *e.* posterior nares; *f.* foramen magnum; *f'.* occipital foramen; *g.* stylo-mastoid foramen; *h.* foramen lacerum; *i.* vascular foramen in basisphenoid; *j.* posterior opening of alisphenoid canal; *k.* anterior opening of alisphenoid canal; *l.* optic foramen.

Both figures are one-eighth natural size.

bone is swollen by this socket, so as to present, in the males at least, a prominent rounded ridge on the side of the face. The alveoli for the pre-molar and molar series of teeth are similar to each other, each presenting three pits for the reception of roots, viz: an inner large pit, and two outer small ones. Over these, the bone is thin, as is usual on the buccal surface of the maxillary.

Behind and above the posterior molar teeth, in the orbital region of the skull, the maxillary bone presents several fissures, or foramina, close to, or in, the suture with the palatine. The first of these may be indistinct, or of different shape on the opposite sides, and is just back of the last molar, as shown in the skull of *Dinoceras lucare*, on Plate IX, figure 2. In *Dinoceras mirabile* (number 1036), three such fissures are situated on the right side of the skull, in or near the maxillo-palatine suture, back of the orbit. One or more of these apertures appear to be the posterior openings of the posterior palatine foramina, an arrangement similar to that seen in the hippopotamus.

THE PALATINE BONES.

The palatine bones form only a small part of the bony palate in *Dinoceras*. The palato-maxillary suture in *Dinoceras mirabile* (number 1036) is nearly opposite the middle of the second molar, and about 20^{mm} in front of the posterior border of the bony palate, (Plate V). It is at first nearly transverse to the palate, then runs backward around the last molar, and turns upward into the orbital region, where it cannot be followed with certainty. Posteriorly, the palatine is in contact with the pterygoid, and the pterygoid plate of the alisphenoid. On the median line of the palate, the suture between the opposite palatines is obliterated.

The palatines continue the lateral walls of the posterior nasal cavities considerably behind the last molar, and these walls are still further extended by the pterygoid bones.

THE PTERYGOID BONES.

The pterygoid bones in *Dinoceras mirabile* (number 1036), are applied to the inner surface of the palatines, and to the pterygoid plates of the alisphenoid (Plate V, *pt*). They appear to unite on the median line in the roof of the posterior nares, but the suture is not distinct. The suture with the palatine is oblique, and that with the alisphenoid can be traced upward beneath the zygomatic arch.

The lower margin of the pterygoid is thickened, and nearly straight. The posterior margin is thinner, and moderately curved.

FIGURE 30.—Horizontal section of skull of *Tinoceras crassifrons*, Marsh (No. 1236).

FIGURE 31.—Horizontal section of skull of *Dinoceras distans*, Marsh (No. 1601).

a cavity behind base of canine tooth; *b*. brain-cavity; *c*. alveoli of canine tooth; *f*. anterior olfactory chamber; *f'*. posterior olfactory chamber; *m'*. maxillary protuberance; *n*. nasal bones; *n'*. nasal protuberance; *p'*. parietal protuberances.

Both figures are one-eighth natural size.

In the skull of *Tinoceras ingens* (number 1041), the palate is only slightly excavated in its anterior part, and the palato-maxillary foramina are brought forward in front of the entire series of molar teeth, instead of being situated nearly opposite the second premolar. The palate between the whole series of molar teeth is nearly flat. The foramen in the maxillo-palatine suture behind the last molar is large and conspicuous, especially on the left side. These foramina are shown in figure 28, page 27.

FIG. 32.

FIG. 33.

FIGURE 32.—Horizontal section of skull of *Tinoceras hians*, Marsh (No. 1499).FIGURE 33.—Horizontal section of skull of *Dinoceras laticeps*, Marsh (No. 1202), female.

a. cavity behind base of canine tooth; *b.* brain-cavity; *c.* alveole of canine tooth; *f.* anterior olfactory chamber; *f'.* posterior olfactory chamber; *m'.* maxillary protuberance; *n.* nasal bones; *n'.* nasal protuberances; *p'.* parietal protuberances.

Both figures are one-eighth natural size.

In the type of *Tinoceras grande* (number 1040), the maxillo-palatine foramen is behind the beginning of the molar series, and the excavation of the palatal region also extends behind the first premolars.

In the type of *Dinoceras*, the palatine fossa of the posterior nares is roofed over, so that the passage from the palate into the large nasal cavities above leads forward and upward, as shown indistinctly in figure 26, *e*, page 26. In *Tinoceras ingens* and *Tinoceras pugnax*, the roof of this fossa is excavated in front by a pair of oval apertures, and through these the posterior nares open directly upward, as represented in figures 28 and 29, *e*, on page 27. The existing perissodactyls, the horse, the tapir, and rhinoceros, have the same type of palate. In *Uintatherium*, the structure of this portion of the skull has not yet been determined with certainty.

Both figures are one-eighth natural size.

These palatine characters of the *Dinocerata* are important, but unfortunately they can be made out only in skulls unusually well preserved. The value of these characters in classification will be discussed in a subsequent chapter.

THE VOMERS.

The vomers in the *Dinocerata* do not appear upon the surface of the palate. They are narrow bones, closely united, and deeply concave upon their upper surface. They are wedged in between the palatine plates of the maxillaries, and in old animals are closely united with them.

The groove formed by the upper concave surfaces of the vomers is filled by the turbinal bones, which are well developed.

The following are the principal dimensions of three of the skulls described in the present chapter. Measurements of others will be found in the Synopsis at the end of the volume :

Measurements of Skull. (Dinoceras mirabile, No. 1036.)

	m.

CHAPTER II.

THE LOWER JAW.

(Plates VIII, XII, XIII, XIX, LV, and LVI.)

The lower jaw in *Dinoceras* is as remarkable as the skull. Its most peculiar feature in the male is a massive decurved process on each ramus, extending downward and outward. These long pendent processes were apparently to protect the upper canine tusks, which would otherwise be very liable to be broken (Plate XIII, figures 1 and 2, *p*). Indications of similar processes are seen in *Smilodon*, and in some other extinct carnivores with long canines.

In *Dinoceras mirabile* (number 1212), the process is concave from above downward on its external surface, and its lower extremity is somewhat thin, and narrowed longitudinally. In *Dinoceras laticeps* (Plate XIII, figures 1 and 2, *p*), this process is more massive, and more rounded below.

In the female, this process is much reduced in size, but is quite sufficient to protect the diminutive tusk, which overlaps it.

With the exception of these processes, the lower jaw is comparatively small and slender. The symphysis is completely ossified, and deeply excavated above.

Another remarkable feature in the lower jaw of the *Dinocerata* is the posterior direction of the condyles, hitherto unknown in Ungulates (Plate

VIII, figure 1, *cd*). The position of the condyles was evidently necessitated by the long upper tusks, since with the ordinary ungulate articulation the mouth could not have been fully opened. The low position of the condyle, but little above the line of the teeth, is also a noteworthy character. In some Marsupials and Insectivores, the condyle has the same position as in the *Dinocerata*, but in no other Ungulates, living or extinct, has this position been observed.

FIG. 36.

FIG. 37.

FIGURE 36.—Lower jaw of *Tinoceras annectens*, Marsh (No. 1043); seen from the left.

FIGURE 37.—The same jaw, seen from above.

c. alveole of lower canine; *d.* diastema; *i.* alveole of incisor; *m.* mental foramen; *p.* process for protection of canine tusk; *s.* symphysis.

Both figures are one-fourth natural size.

In *Dinoceras laticeps* (Plates XII and XIII), the entire lower jaw is more massive than in *Dinoceras mirabile*. The angle of the jaw is stouter, and distinctly inflected (Plate XIII, figure 2, *a.*)

The coronoid process of the lower jaw in *Dinoceras* is large and elevated, somewhat curved backward, and pointed above (Plate VIII, figure 1, *cr*). The angle of the jaw is rounded in outline, and projects downward somewhat below the main portion of the ramus. The dental foramen is large, and bounded above by a ridge, which extends upward and backward to the condyle. The mental foramen is of moderate size, and situated near the base of the anterior pendent process.

FIG. 38.

FIGURE 38.—Lower jaw with upper canine in position of *Tinoceras longiceps*, Marsh (No. 1256), female; seen from the left.

a. angle of jaw; *c*, upper canine tooth in its natural position; *c'*, lower canine tooth; *cd*, condyle; *cr*, coronoid process; *d*, diastema; *p*, process for protection of canine tusk.

One-fourth natural size.

In the genus *Tinoceras*, the same general characters of the lower jaws are seen. In the male, the pendent process is large and elongate, but less massive than in the genus *Dinoceras*, and its lower outline less regularly rounded (Plate XIX, figure 1, *cp*). This corresponds with the position of the large upper canine tusk, which it protects.

In the female of *Tinoceras*, the pendent process is much reduced, its size in all cases corresponding to the size of the canine tusk above. In the female of *Tinoceras longiceps* (figure 38, above), the lower jaw is remarkably long and slender, and the pendent process nearly obsolete.

That the same relation in size between the tusk and process below it holds equally in both the genera *Dinoceras* and *Tinoceras*, is conclusively shown by various specimens in the Yale Museum.

FIGURE 39.—Lower jaw of *Dinoceras mirabile*, Marsh (No. 1251); seen from the left.

FIGURE 40.—The same jaw; seen from the front.

c. alveole of canine; *f.* anterior foramen; *di.* deciduous incisor; *i.* alveole of incisor; *m.* mental foramen; *p.* process for protection of tusk.

Both figures are one-fourth natural size.

In the genus *Dinoceras*, there are three incisor teeth, and a small incisiform canine on each side forming a continuous series at the front extremity of the lower jaw. These are all of moderate size, and inclined well forward, as in the ruminant mammals. Behind this series, and immediately over the dependent process, is a long diastema (Plate VIII, figure 1, *d*). Further back, there are three premolars, and three molars, forming together a close series. This is the dentition, essentially, in the lower jaw of both *Dinoceras* and *Tinoceras*, and will be described more fully in the following chapter.

In a lower jaw found near the locality of the type of *Uintatherium robustum*, and here referred to that genus, there are four premolars instead of three. The first premolar, wanting in *Dinoceras* and *Tinoceras*, is of small size, and is placed just behind the lower canine. It is separated from the second premolar by a diastema, as shown in figures 41 and 42, page 39.

In the present state of knowledge of the *Dinocerata*, this first lower premolar may be regarded as a distinctive feature of the genus *Uintatherium*, the type specimen of which, unfortunately, is too fragmentary for a complete identification of its principal characters.

FIG. 41.

FIG. 42.

FIGURE 41.—Lower jaw of *Uintatherium segne*, Marsh (No. 1194); seen from the left.

Both figures are one-fourth natural size.

The principal dimensions of three of the lower jaws described in this chapter are as follows:

Measurements of Lower Jaw. (Dinoceras laticeps, No. 1039.)

	m.
Greatest length of ramus,	0.54
Extent of symphysis,	0.18
Height of coronoid process from bottom of ramus,	0.235
Depth of ramus at last molar,	0.09
Depth of ramus at tusk process,	0.185
Extent of diastema,	0.10
Extent of molar series,	0.18
Greatest width across condyles,	0.295
Transverse diameter of condyle,	0.087
Vertical diameter of condyle,	0.048

Measurements of Lower Jaw. (Uintatherium segne, Marsh, No. 1194.)

	m.
Greatest length of ramus,	0.49
Extent of symphysis,	0.165
Height of coronoid process from bottom of ramus (approximate),	0.19
Depth of ramus at last molar,	0.075
Depth of ramus at tusk process,	0.17
Extent of molar series (functional),	0.145
Transverse diameter of condyle,	0.076
Vertical diameter of condyle,	0.040

Measurements of Lower Jaw. (Tinoceras longiceps, Marsh, No. 1256, female.)

	m.
Greatest length of ramus (approximate),	0.57
Extent of symphysis,	0.185
Height of coronoid process from bottom of ramus,	0.26
Depth of ramus at last molar,	0.084
Depth of ramus at tusk process,	0.10
Extent of diastema,	0.145
Extent of molar series,	0.175
Transverse diameter of condyle,	0.070
Vertical diameter of condyle,	0.045

CHAPTER III.

THE TEETH.

(Plates I-V, VII-X, XII-XIX, LV and LVI.)

The teeth of the *Dinocerata* constitute one of their most interesting features, differing widely in form and dentition from most of the other *Ungulata*.

In the genus *Dinoceras* the dentition is represented by the following formula:

$$\text{Incisors } \frac{0}{3}, \text{ canines } \frac{1}{1}, \text{ premolars } \frac{3}{3}, \text{ molars } \frac{3}{3} = 34.$$

So far as now known, the same formula applies equally well to the genus *Tinoceras*.

In *Uintatherium*, the dentition is apparently as follows:

$$\text{Incisors } \frac{0}{3}, \text{ canines } \frac{1}{1}, \text{ premolars } \frac{3}{4}, \text{ molars } \frac{3}{3} = 36.$$

THE INCISORS.

In none of the *Dinocerata* have any upper incisors been found, even in the youngest specimens. The premaxillary bones appear to be entirely edentulous, although in some specimens, especially in *Dinoceras laticeps* (number 1039), there are shallow depressions at irregular intervals that strongly suggest the probability of embryonic teeth in very young, or foetal individuals. A fortunate discovery in the future may, perhaps, settle this point.

In the lower jaws of all the known *Dinocerata*, there are three well-developed incisors on each side. They are inserted, each by a single root, and are procumbent, all directed well forward. Their inner surfaces

FIG. 43.

a. side view; b. top view; c. antero-posterior view.

All the figures are of natural size.

continue the deep groove on the upper part of the lower jaw, above the symphysis. The position of the sockets for these teeth in *Dinoceras* is shown in Plates XII and XIII, and the form of the teeth, in Plate VIII, figure 1. The crowns of these incisors are covered with enamel, and the special features of both crown and root are shown in figures 43–45, page 42.

In the genus *Tinoceras*, the incisors are similar in form, but have a less inclined position, as indicated in Plate XIX, figure 1.

FIGURE 46.—Upper canine of *Dinoceras lucare*, Marsh (No. 1038); male. *b*. lateral view, inner surface; *b'*. outline of section of tooth; *b''*. section of tooth showing pulp cavity; *c*. front view of tooth.

FIGURE 47.—Upper canine of *Dinoceras laticeps*, Marsh (No. 1202); female. *a*. outer surface; *b*. inner surface; *b'*. outline of section; *c*. front view.

FIGURE 48.—Upper canine of *Tinoceras longiceps*, Marsh (No. 1256); female. *a*. outer surface; *b*. inner surface; *c*. front view of tooth.

The dotted line on the teeth marks the position of the alveolar border, below which the tusk was exposed.

All the figures are one-fourth natural size.

THE CANINES.

The superior canines of *Dinoceras* are long, recurved, trenchant tusks. The crown is covered with enamel, and the root extends upward into the base of the maxillary protuberance, or horn-core. When the animal is

young, these tusks grow from a persistent pulp, but in old age the cavity becomes nearly closed. In the male, these tusks are large and powerful, and extend downward nearly or quite to the extremity of the pendent process of the lower jaw.

FIGURE 49.—Upper canine of *Tinoceras grande*, Marsh (No. 1040); male.

FIGURE 50.—Upper canine of *Dinoceras laticeps*, Marsh (No. 1222); male.

a. lateral view showing outer surface; *b.* inner surface; *b'*, *b''*. sections; *c.* front view.

The dotted line on the teeth marks the position of the alveolar border, below which the tusk was exposed.

All the figures are one-fourth natural size.

In *Dinoceras mirabile* (number 1036), the canine tusks are oval in section, where they emerge from the jaw, then become somewhat constricted, before expanding into a wide, thin, lanceolate extremity, as shown in Plate I. On the outer surface of these tusks, there is a distinct ridge in the lower half exposed, giving there a subtriangular, or bayonet-like form.

In *Dinoceras lucare*, the upper canines are not constricted, but taper to the lower end, which has, also, a bayonet form (Plate IX, figure 1, *c*).

FIG. 51.

FIG. 52.

FIGURE 51.—Upper canine of *Tinoceras ingens*, Marsh (No. 1043); male.

FIGURE 52.—Upper canine of *Tinoceras pugna*, Marsh (No. 1044); male.

a. lateral view, showing outer surface; *b.* inner surface; *b'*, *b''*, *b'''*, sections of tooth; *c.* front view.

All the figures are one-fourth natural size.

In the female of *Dinoceras*, the upper canines are small and slender, and protrude but little below the jaw (Plate XIV, figure 1, *c*).

In *Tinoceras*, the upper canines are much more curved than in *Dinoceras*, and the end of the root, instead of being inserted in the base of the maxillary horn-core, starts well back of it, so that the general direction of this elevation is nearly at right angles to the tusk.

The general form of the upper canine tusks in the *Dinocerata* is shown in figures 49-52, on pages 44 and 45.

In the lower jaw of *Dinoceras*, the canine is very small, and very similar in form to the incisors, which it adjoins (Plate VIII, figure 1, c). The same is true in the genus *Tinoceras*, where the lower canine, as well as the incisors, has a more erect position than in *Dinoceras*.

THE UPPER PREMOLARS.

The crowns of the premolar and molar teeth in *Dinoceras*, and, in fact, in all of the known *Dinocerata*, are remarkably short, with the roots well developed, forming a true brachyodont dentition, as in all early Tertiary ungulates. These teeth are all inserted by three roots, two small ones on the outer side, and a larger one on the inner side.

In the type of *Dinoceras mirabile* (number 1036), the upper molar series is remarkably well preserved. The entire set of premolars and molars is in position, indicating that the animal was fully adult, and yet the amount of wear shown by these teeth is so slight as not to obscure in the least their essential characters.

The form and relative position of the series on the two sides is well shown in Plate VII, figure 2. There are three premolars, and three true molars on each side, forming together a close series. There is, in this skull, no trace of what may be regarded as the first premolar. If present during the immature condition of the animal, it has entirely disappeared. In one specimen of this genus (number 1039), the alveole of this first upper premolar remains, but no other trace of the tooth has been seen.

The first premolar of *Dinoceras mirabile* in place, which would correspond to the second in the complete ungulate dentition, is the

smallest of the present series. Its crown is subtriangular in outline, with the apex in front. The antero-external face is cordate in outline, somewhat concave, with the point below. On the inner side, there is an elevated lobe, somewhat inside of, and separated from, the apex of the external face. On the inner and posterior faces of this premolar, there is a strong basal ridge, which is nearly or quite obsolete on the anterior face.

FIG. 53.

FIG. 54.

FIGURE 53.—Upper molar series of *Tinoceras stenops*, Marsh (No. 1567); seen from below.FIGURE 54.—Lower molar series of same specimen; seen from above. *m.* molar; *pm.* premolar.

The figures are three-fourths natural size.

The second upper premolar in this series is much larger than the one last described. The crown is sub-cordate in outline, the apex pointing inward, and somewhat backward. The essential features of the crown consist of two transverse ridges, which meet internally, forming a V-shaped figure. This is the characteristic type of the upper molar series in the *Dinocerata*. The anterior transverse ridge of this tooth has its external extremity somewhat curved backward. This premolar has a well marked basal ridge, entirely surrounding it, although somewhat thin near the middle of the anterior border.

The last upper premolar is very similar to the one just described. Its crown is somewhat more triangular in outline, and the crests of the transverse ridges are straighter. The basal ridge is continued and well developed.

THE UPPER MOLARS.

The first true molar is much like the last premolar in general form. It shows by its greater wear that it made its appearance before the last premolar, and in this way its true position in the series is indicated. The anterior transverse crest in this tooth is considerably larger than the posterior crest, and the valley between them is much wider than in the premolars. Behind the posterior crest, moreover, there is, on the inner posterior angle of the crown, a distinct tubercle. This is seen in all of the true molars in *Dinoceras*, and will distinguish them, at once, from premolars of similar general form. The basal ridge of this first molar is well developed, except on the outer side, opposite the outlet of the transverse valley.

The second, or penultimate, upper molar is much larger than the first, but similar in general form. The transverse and antero-posterior diameters of the crown are nearly equal, the former being somewhat greater. The basal ridge is well developed on the posterior side of the crown, and distinct on the internal and anterior faces, but is obsolete on the external face, near the middle.

The last upper molar is much the largest of the series, and the transverse diameter of the crown is considerably greater than the antero-posterior diameter. The anterior crest is larger than the posterior, and considerably curved, with the convexity in front. The posterior crest is nearly straight, but does not join the anterior crest closely at its inner extremity, the two forming a U-shaped figure. Back of the crest, on the posterior, internal border, there are two distinct tubercles in this specimen, as shown in Plate VII, figure 2. The basal ridge is continuous, except between the outer margin of the lateral crests, where it is lost in the depression on this part of the crown.

In *Dinoceras lucare* (number 1038), the upper molar teeth agree with those already described, in their main characters, but as this individual was considerably older than the type of *Dinoceras mirabile*, the teeth show a greater degree of wear, as represented in Plate IX, figure 2.

In the genus *Tinoceras*, the upper molar series is essentially the same in position and structure as in *Dinoceras*.

In *Tinoceras ingens* (number 1041, Plate XVIII, figure 2), the upper series of molar teeth is shown, with a still greater degree of wear than in those above described. In figure 53, page 47, the upper molar series of *Tinoceras stenops* is represented.

THE LOWER PREMOLARS.

In each ramus of the lower jaw of *Dinoceras*, there is a close series of six teeth, three of which are premolars, and three true molars. These are all inserted each by two roots. This is also true of the genus *Tinoceras*. In these two genera, so far as known, there is no indication of any premolar in front of this series.

The first premolar of the typical ungulate dentition has not been detected in any specimen, young or old, of these genera. In the lower jaw of *Uintatherium*, as this genus is here defined, there were four premolars. The first lower premolar is here present, situated somewhat in front of the others, and but little separated from the lower canine. It was a small tooth, inserted by two roots, and in all probability had no predecessor. The position of this tooth is shown in figures 41 and 42 on page 39.

The second lower premolar, the first of the series in *Dinoceras*, was inserted by two roots. Its crown consists of a large anterior lobe, and a small posterior one. There is a distinct basal ridge on the external surface, which curves around upon the anterior and posterior faces, but is wanting on the inner surface.

The second premolar of this series, representing the third premolar, is considerably larger than the one in front of it, and its crown is less compressed transversely. The anterior and posterior lobes of the crown, especially the former, are here elongated in the transverse ridges, approximating to the V-shaped figure in the corresponding upper premolars. The basal ridge is here on the external face, and curves around behind, so as to enclose the posterior tubercle.

The last lower premolar is very similar in form and size to the one before it, but is somewhat larger. The basal ridge has a similar position.

THE LOWER MOLARS.

The first true lower molar is smaller than the last premolar, but is similar in the general form and composition of its crown. It shows a greater degree of wear than the tooth in front of it, thus indicating that it appeared earlier, and is the first of the true molar series. The inner end of the anterior lobe, or crest, has its summit divided by a distinct notch, a trace of which was seen in the corresponding part of the last lower premolar. The basal ridge is distinct on the outer face, and likewise curves around behind the posterior lobe.

The second, or penultimate, lower molar is much larger than the first, and has the transverse ridges much more strongly developed. The anterior one is considerably elevated, and the two do not meet closely on the inner side. The basal ridge is here distinct on the outer surface, and swells in front into a distinct ridge, and behind into a broader crest, or heel.

The last lower molar in *Dinoceras* is much the largest of the series. The anterior crest is nearly straight transversely. The posterior crest is inclined inward and forward, the two meeting on the inner face, forming a distinct V-shaped pattern. The posterior lobe, or heel, is here largely developed, and more distinctly separated by a deep valley, from the two crests just described.

The position and general form of the lower molar teeth in *Dinoceras laticeps* is shown in Plates XII and XIII.

The corresponding teeth in the genus *Tinoceras* are well shown in Plate XIX. The posterior transverse crest of the penultimate and last lower molar have here a distinct tubercle at their inner extremity, at the apex of the typical V-shaped pattern. This is shown especially in figure 2 of Plate XIX. In figure 54, on page 47, the lower molar series of *Tinoceras stenops* is represented.

All of the incisors, canines, and premolars in *Dinoceras* and *Tinoceras* appear to have been preceded by a series of temporary teeth. The incisors, and lower canines sometimes made their appearance before their small predecessors had disappeared. In one specimen, represented in figures 39 and 40, page 38, these immature teeth are seen in place in small cavities in the sides of the alveoles of the permanent dentition.

The lower incisors and their accompanying canines are usually more or less worn. This is due mainly to the food consumed, and in part to the attrition of the upper canines, and, perhaps, also to a heavy, coarse, upper lip. The premaxillaries, being edentulous, probably supported a pad, as in ruminants.

The upper canines show distinct traces of wear on their inner surface near the base, and, also below, near the apex of the crown. This wear is probably due to the action of the agencies just described.

A more difficult problem is presented by the worn surface sometimes seen on the outer face of these tusks, somewhat below the insertion in the jaw, as shown in figure 51, page 45. This is probably due to the wearing action of a heavy upper lip.

The molar teeth in *Dinocerata* appear to resemble more closely the corresponding teeth in the genus *Coryphodon* than those of any other animal. The general dentition, however, is quite distinct. *Coryphodon* has well developed upper incisors, and a medium-sized upper canine, thus differing widely in these features from the *Dinocerata*. The position and size of these teeth in *Coryphodon* are shown in figure 66, page 63. The upper and lower molar series are shown in figures 55 and 56, page 52.

CHAPTER IV.

THE BRAIN.

(Plate VI.)

The brain of the *Dinocerata* is one of the most peculiar features of the group. It is especially remarkable for its diminutive size. It was proportionally smaller than in any other known mammal, recent or fossil, and even less than in some reptiles. It was, indeed, the most reptilian brain in any known mammal. In *Dinoceras mirabile* (number 1036), the entire brain was actually so diminutive that it could apparently have been drawn through the neural canal of all the presacral vertebræ, certainly through the cervicals and the lumbar.

The size of the entire brain in *Dinoceras*, as compared with that of the cranium, is shown in the accompanying cuts, figures 7 and 8, page 15, and figures 57 and 58, page 54. The size of the brain-cavity, and its position in the skull in *Tinoceras*, also, is represented in figure 9, page 16, and figure 67, page 63.

The most striking feature in the brain-cavity itself, is the relatively small size of the cerebral fossa, this being but little larger than the cerebellar portion. This is well shown in Plate VI, the figures of which are drawn from the cast of the brain-cavity of *Dinoceras mirabile*, the type of the genus.

The cerebral hemispheres did not extend at all over the cerebellum or the olfactory lobes. The latter were large, and continued well forward. The hemispheres were probably convoluted, and the sylvian fissure appears to be distinctly marked.

FIG. 57.

FIG. 58.

FIGURE 57.—Skull of *Dinoceras laticeps*, Marsh (No. 1039); male; with brain-cast in position.FIGURE 58.—Skull of *Dinoceras laticeps* (No. 1202); female; with brain-cast in position.

f. frontal bone; *m.* maxillary bone; *m'.* maxillary protuberance; *n.* nasal bone; *n'.* nasal protuberance; *p.* parietal bone; *p'.* parietal protuberance; *s.* supraoccipital crest.

Both figures are one-eighth natural size.

The cerebellar fossa is but little larger, transversely, than the medullar canal, and has lateral cavities, which were probably occupied by flocculi. There was a rudimentary tentorial ridge. The pituitary fossa is nearly round, and of moderate depth. There are no clinoid processes.

THE CRANIAL NERVES.

The nerves passing off from the brain were large, and can be made out with reasonable certainty. The olfactory lobes were separated in front by an osseous septum, the position of which is shown distinctly in Plate VI, figure 2

FIG. 59.

FIG. 60.

FIGURE 59.—Cast of brain-cavity of *Tinoceras ingens*, Marsh (No. 1041); side view.

FIGURE 60.—The same; superior view.

c. cerebral hemispheres; cb. cerebellum; f. flocculus; m. medulla; ol. olfactory lobes; op. optic nerves; V. fifth nerve; XII. twelfth nerve.

Both figures are three-fourths natural size.

The cribriform plate, bounding these lobes in front, is thin and easily displaced, but its position in the specimen is shown approximately by the extremity of the olfactory lobes represented in Plate VI. In front of this plate the olfactory nerves were spread out in a large cavity, which is represented in figures 30 and 31, page 29. The nasal canals extend forward from this cavity to the external nares, as indicated in the same figures. In these canals there were thin, well developed, ethmo-turbinal bones, which were easily displaced, and broken up. The presence of these bones is strong evidence that there was no proboscis.

The optic nerves, or second pair, were well developed. Their position, size, and place of exit, are shown in Plate VI, figure 3, *op*.

The fifth pair of nerves, or tri-geminals, were very large, and were given off on either side, behind the optics, and opposite the depression for the pituitary body, as shown in Plate VI, figure 3, *v*.

The sixth pair of nerves passed off immediately behind and below the last pair. Their position and relative size are shown in Plate VI, figure 3, *f*. The twelfth pair, or hypoglossal nerves, passing off through the condylar foramina, were large, and their position is given in Plate VI, figure 3, *xii*, and *cf*. The position and exit of the other nerves sent off from the brain cannot be determined with certainty.

In the genus *Tinoceras*, the brain was similar in its general characters to that of *Dinoceras*, but appears to have been somewhat more highly developed, as shown in figures 59 and 60, page 55. The hemispheres were more elongate, and the olfactory lobes relatively smaller. The cavities for the flocculi were quite large, and directed well forward. The twelfth pair of nerves were largely developed.

In *Uintatherium*, the brain of the type specimen was nearly, or quite, as small as in *Dinoceras*. The hemispheres were short, and moderately expanded transversely. The olfactory lobes were separated by a wide septum, and were much more divergent than in *Dinoceras* or *Tinoceras*. These characters are shown in figures 61 and 62, page 57, which are of the same relative size as the figures in Plate VI.

Both figures are three-fourths natural size.

BRAIN GROWTH.

The *Dinocerata* are, by far, the largest of all known Eocene land animals, and that they have, also, a very diminutive brain is a noteworthy fact, which attracted the author's attention soon after their discovery.

The comparison of the brain in this group with that of other mammals from the same formation soon showed that the *Dinocerata*, although most remarkable in this respect, were not alone in diminutive capacity of brain power. A more extended comparison led to the fact that all of the early Tertiary mammals had very small brains, and in many of them the brain was of a low, almost reptilian, type. As the comparison was extended to include the mammals from the higher divisions of the Eocene, and from the Miocene, the same fact became more apparent, but a gradual increase in size and quality of the brain soon became evident in extending the investigation to the animals of more recent geological age. In bringing into the investigation the mammals from the Pliocene and Quaternary, the improvement in brain power became still more apparent, and the outline of a general law of brain growth was soon determined.

In tracing thus the different groups of mammals, each from the early Tertiary to the present time, it was found that in every series where the material was sufficient to make a fair comparison, the brain-growth had been constant, and followed the same law.

The results of this investigation were embodied by the author in a general law of brain-growth in the extinct mammals throughout Tertiary time. This law, briefly stated, was as follows:

1. All Tertiary mammals had small brains.
2. There was a gradual increase in the size of the brain during this period.
3. This increase was confined mainly to the cerebral hemispheres, or higher portion of the brain.
4. In some groups, the convolutions of the brain have gradually become more complex.
5. In some, the cerebellum and the olfactory lobes have even diminished in size.
6. There is some evidence that the same general law of brain growth holds good for Birds and Reptiles from the Cretaceous to the present time.¹

¹ *American Journal of Science and Arts*, Vol. VIII, p. 66, July, 1874; and Vol. XII, p. 61, July, 1876; see also the author's Monograph on the ODONTORNITHES, p. 10, 4to, Washington, 1880.

The author has since continued this line of investigation, and has ascertained that the same general law of brain growth is true for Birds and Reptiles from the Jurassic to the present time.

To this general law of brain growth two additions may now be made, which briefly stated are as follows:

(1.) The brain of a mammal belonging to a vigorous race, fitted for a long survival, is larger than the average brain, of that period, in the same group.

(2.) The brain of a mammal of a declining race is smaller than the average of its cotemporaries of the same group.

An example of the first of these statements is seen in figure 70, page 64, representing the genus *Colonoceras*, one of the Eocene ancestors of the Rhinoceros. The second case is illustrated by figure 82, page 67, of the Hippopotamus, evidently one of the last members of a long line. A study of a larger number of extinct and recent specimens will make these conclusions more apparent.

The results of this study of the whole subject of brain growth, the author intends to bring together in a separate memoir. Some of the principal facts, however, may be appropriately presented in the present volume in connection with the brain characters of the *Dinocerata*, which naturally form the beginning of one series in the investigation.

In any comparison of the size of the brain in different animals, whether in the same group or in others widely different, it is important to bear in mind that:

1. The brain of small animals is proportionally larger in bulk than that of large animals.
2. The brain of young animals is proportionally larger than in those fully adult.

In a general comparison of brain growth of mammals, the first of these facts can have only a limited effect, which would not change, essentially, the general results. The effects of the second fact may be readily eliminated by confining the comparison to adult animals.

In this comparison, moreover, of the extinct forms with those of more modern time, including recent mammals, it may be taken for granted that the brain-cavity of the extinct forms, as well as of those now living, was entirely filled by the brain; since, with a possible single exception, no mammal is known in which this is not the case.

In comparing the size of the brain in mammals with that of reptiles and fishes, an important point to be borne in mind would be the fact, that in the two latter classes the brain-cavity is not always entirely filled by the brain. The present comparison deals with mammals alone, and this restriction is here of no importance.

The fact that among existing mammals there are some anomalous features in the size of the brain in allied groups has not been forgotten, but such instances, even if they occurred among extinct mammals, would not materially affect the general comparison here proposed.

In the following pages a series of figures is given, showing the comparative size of the brain, and its position in the skull in a number of the larger ungulate mammals, recent and extinct. To make the comparison a fair one, the skulls are all drawn of the same absolute size, thus showing, at once, the relative proportion of the brain in each. The skulls are placed horizontally, the plane of the molar teeth being as a rule taken as a base. In the case of the four artiodactyls, figures 80 to 83, page 67, this position has been somewhat changed, as, in this group of ungulates, the brain is more or less inclined backward in the skull. In these cases, the skull is represented as somewhat inclined forward, thus raising the posterior part of the brain. The angle of inclination of the face and of the brain, is made equal, thus giving to both the best position for comparison, and not materially affecting it for the present purpose.

A striking illustration of the development of the brain from the early Tertiary to the present time may be seen in figures 63-65, page 61, where is shown, first, the skull of *Dinoceras*, the largest land mammal of the Eocene, with the brain in position; second, the skull of the gigantic Miocene *Brontotherium*, with the brain also in position; and third, the skull of the recent horse. Other comparisons, equally striking, can readily be made.

FIG. 63.

FIG. 64.

FIG. 65.

- FIGURE 63.—Outline of skull of *Dinoceras mirabile*, Marsh; with cast of brain-cavity in position: about one-eighth natural size. Eocene.
- FIGURE 64.—Outline of skull of *Brontotherium ingens*, Marsh; with cast of brain-cavity in position; one-tenth natural size. Miocene.
- FIGURE 65.—Outline of skull of horse, *Equus caballus*, Linnaeus; with cast of brain-cavity in position; about one-sixth natural size. Recent.

The small size of the brain in early Tertiary mammals will be indicated by an examination of the *Dinocerata* skulls, with the brain in position, shown in figures 57 and 58, page 54. This is further shown by figure 66, page 63, which represents the skull and brain of *Coryphodon*, the largest mammal in the lower Eocene, from beds of earlier age than those containing the *Dinocerata*, as shown in the section, figure 2, page 7.

The size of the brain in the middle Eocene genera *Palæosyops*, *Lymnocybus*, *Colonoceras*, and *Hyrachyus* are shown in figures 68 to 71, pages 63 and 64. *Amynodon* from the upper Eocene is represented in figure 72, page 64.

The larger brain of the Miocene mammals is indicated by the figure 64, page 61, representing the skull of *Brontotherium*, which is found at the base of the Miocene, as shown in figure 2, page 7. *Elotherium* from the same horizon is represented in figure 75. The skull of *Eporeodon*, with its brain in position, figure 73, page 64, also affords a good illustration of a mammal from this formation. This genus is found in the middle Miocene, as shown in the section, page 7.

The still more developed brain of the Pliocene mammals is seen in figure 74, page 65, which gives a view of the skull of the Mastodon, with the brain in position. In figure 76, page 65, the skull and brain of an extinct Pliocene peccary further illustrates the same law of brain-growth.

On comparing these various figures with those representing the brains and skulls of the existing Ungulates, as shown by the succession in figures 77-83, on pages 66-67, the reader will have before him a series of facts which illustrate the laws of brain-growth given on page 58. The comparison, here confined to the representative ungulate mammals, might easily be extended much farther, but would not come within the scope of the present volume.

The author has made similar comparisons in other groups of mammals, including those that can be followed from the early Tertiary to the present time, and the results are uniformly the same. These results the author hopes to present fully elsewhere at no distant day.

CHAPTER V.

THE CERVICAL VERTEBRÆ.

(Plates XX, XXI, XXII, LV, and LVI.)

THE cervical vertebræ of the *Dinocerata*, in their main characters, resemble those of the Proboscidiæ. The atlas and axis are somewhat similar to those of the elephant. The rest of the cervicals are proportionally longer. The entire neck was about one-third longer than in the elephant, thus rendering a proboscis unnecessary, as the head could readily reach the ground.

All the presacral vertebræ, behind the atlas and axis, have the articular faces of the centra nearly flat, as in the typical Proboscidiæ. In other respects, they present no strongly marked characters of importance.

THE ATLAS.

(Plate XX; and woodcuts 84, 85, and 86, below.)

The atlas in the *Dinocerata* is a massive bone, presenting the ordinary articular faces of this vertebra. The anterior pair of these, for the reception of the occipital condyles, are well separated above and below. The three posterior faces, for articulation with the second vertebra, or axis, are also widely separated from each other. All these three faces are sub-circular in outline, and the lateral ones are somewhat emarginate

along the inner side. The median facet, for articulation with the odontoid process, is flattened in front, or slightly convex in antero-posterior direction, and extends longitudinally over the greater part of the inferior arch of the atlas. Its boundaries are well marked on all sides, as are also those of the lateral faces. Hence the articulation between the atlas and axis admitted but little rotary motion to the head.

The spine of the atlas is not well marked, although the superior arch is massive, and its anterior surface is rough and tuberculated. This arch is pierced on each side anteriorly by a foramen (figure 84, *d*), the inner opening of which is just above the inner and upper angle of the condylar articular surface. Externally, this foramen is connected by a more or less evident groove with one piercing the transverse process lengthwise. This groove runs vertically down the side of the atlas, and through a deep notch in the anterior margin of the transverse process. In the tapir, this groove passes through a foramen, instead of a notch in the anterior part of the transverse process. A similar arrangement is seen in the horse, ox, sheep, camel, and in various other Ungulates.

The transverse processes of the atlas are short, and strong. They are moderately flattened, thicker and stouter behind than before, and placed obliquely, so as to slant strongly downward and backward. Anteriorly, the outer margin runs rapidly down to the lateral arch of the atlas, but is separated from it at the base of the process by the deep notch, mentioned above. Posteriorly, they are thickened and rugose. The base of each lateral process is perforated by a foramen, directed somewhat downward, and forward. The under surface of the atlas (figure 86) is smooth and even, with no rugosity to mark the median line.

The atlas of *Dinoceras mirabile* is shown in Plate XX, and that of *Tinoceras grande*, in the woodcuts below, figures 84, 85, and 86. The position of the atlas, with reference to the skull, is represented in the restorations in Plates LV and LVI.

FIG. 84.

FIG. 86.

FIGURE 84.—Atlas of *Tinoceras grande*, Marsh (No. 1040); front view.

FIGURE 85.—The same vertebra; back view.

FIGURE 86.—The same vertebra; bottom view.

a. face for axis; *b.* face for odontoid process of axis; *c.* face for occipital condyle of skull; *d.* foramen in neural arch for spinal nerve; *nc.* neural canal.

All the figures are one-fourth natural size.

The following measurements give the principal dimensions of the atlas in one specimen of *Dinoceras*:

Measurements of Atlas. (Dinoceras mirabile, No. 1251.)

	m.
Greatest transverse diameter of atlas,	.265
Greatest vertical diameter of atlas,	.142
Transverse diameter of neural canal,	.090
Vertical diameter of neural canal,	.080
Antero-posterior diameter of superior arch,	.067
Vertical diameter of superior arch,	.034
Antero-posterior diameter of inferior arch,	.149
Diameters of faces for occipital condyles,	.072-.052
Distance between faces for occipital condyles, above,	.080
Distance between faces for occipital condyles, below,	.058
Diameters of face for odontoid process,	.043-.035
Diameters of lateral faces for axis,	.063-.056
Distance between lateral faces for axis,	.065

THE AXIS. (Plate XXI.)

The axis in *Dinoceras mirabile* (number 1036) is robust, and proportionally shorter than the corresponding vertebra in the tapir. The centrum is moderately flattened below, but not excavated as in the tapir, and presents, medially, a tuberculation at the union of its centrum with that of the first vertebra. The odontoid process is distinctly conical, and not at all excavated above. Its perpendicular diameter, moreover, exceeds its transverse. It is pointed in front, and bears, on its under surface, a saddle-shaped articular face for union with the atlas. This surface is not confluent with the lateral surfaces, as in the elephant, tapir, and most Ungulates, but is perfectly distinct, as in the kangaroo, and in man. The lateral articular faces are moderately convex in both directions, and have their longest diameter nearly transverse.

The neural arch is massive, and its lateral walls are not pierced by foramina, agreeing, in that respect, with those of the kangaroo. On the lateral surfaces of the centrum, the vertebrarterial, or lateral, foramen was present, and circumscribed by bone. Its upper wall was much weaker than the lower, instead of subequal, as in the tapir. The neural arch is surmounted by a short and stout neural spine, low in front, and rising behind, though less rapidly than in the tapir, and becoming rather indistinctly bifid at the top. The neural spine is deeply excavated behind.

The posterior zygapophyses are robust, slightly convex, and look more downward than outward, and only slightly backward. The posterior face of the centrum is transverse, and broadly oval in outline. The floor of the neural canal is flattened, and presents a number of vascular foramina leading into the centrum.

The transverse processes of this specimen are imperfectly preserved, but were evidently pierced, above the middle, by a large lateral foramen. The processes appear to have been directed rather less strongly backward than in the tapir.

The principal dimensions of the axis in three specimens of *Dinoceras* are as follows:

THE CERVICAL VERTEBRÆ.

73

Measurements of Axis. (Dinoceras mirabile, No. 1036.)

	m.
Length of axis, on floor of neural canal (approximate),	.150
Length of odontoid process,	.056
Transverse diameter of odontoid process,	.035
Vertical diameter of odontoid process,	.052
Transverse diameter of anterior articular face,	.068
Vertical diameter of anterior articular face,	.065
Transverse diameter of vertebra, across anterior articular faces,	.148
Transverse diameter of neural canal,	.053
Vertical diameter of neural canal,	.042
Transverse diameter of vertebra, across post-zygapophyses,	.122
Transverse diameter of posterior face of centrum,	.093
Vertical diameter of posterior face of centrum,	.072
Height of axis, to top of neural spine,	.175
Transverse diameter of neural spine,	.048
Antero-posterior diameter of neural spine,	.085

Measurements of Axis. (Dinoceras mirabile, No. 1255.)

	m.
Length of axis, on floor of neural canal (approximate),	.125
Length of centrum, along under surface,	.140
Length of odontoid process, from lateral articular faces,	.045
Transverse diameter of odontoid process,	.037
Vertical diameter of odontoid process,	.038
Transverse diameter of articular face of odontoid process,	.035
Antero-posterior diameter of articular face of odontoid process,	.042
Transverse diameter of neural canal,	.039
Vertical diameter of lateral foramen,	.012

Measurements of Axis. (Dinoceras lucare, No. 1038.)

	m.
Total length of axis,	.170
Length, from end of odontoid process to end of neural canal,	.148
Transverse diameter of odontoid process,	.035
Vertical diameter of odontoid process,	.046
Greatest diameter of anterior articular face,	.070
Transverse diameter, across anterior articular faces,	.142
Antero-posterior diameter of face on odontoid process,	.044
Transverse diameter of face on odontoid process,	.033
Distance between antero-lateral articular faces,	.050
Transverse diameter of centrum, behind faces,	.125
Transverse diameter, across post-zygapophyses,	.115
Transverse diameter of posterior face of centrum,	.093
Vertical diameter of posterior face of centrum,	.080
Diameters of lateral foramen,	.013-.020
Diameters of neural canal (approximate),	.040-.050

THE THIRD VERTEBRA. (Plate XXII, figures 1-5.)

The third cervical of *Dinoceras mirabile* (number 1036) is shown in Plate XXII, figures 1-5. This vertebra, in the type specimen, is not in a good state of preservation, but represents fairly the main characters of the third cervical in this genus.

The pre-zygapophyses are somewhat concave, to fit the convex post-zygapophyses of the axis. The neural canal is large, and the arch above it is only moderately developed, and without a spine. The lateral, or vertebrarterial, foramen is oval in outline, and is protected by a strong transverse process. The under surface of the centrum is marked by a median longitudinal keel, as shown in figures 3 and 5.

The third cervical vertebra of *Dinoceras mirabile* (number 1255) is short, and the articular faces of the centrum are both somewhat concave. The anterior face is slightly less excavated than the posterior. The length of the centrum is less than its vertical diameter, and the latter is greater than the transverse diameter. The epiphyses are incompletely ossified, and only imperfectly united to the centrum. These general characters apply also to the remaining cervical vertebræ.

The principal dimensions of the third vertebra in one specimen of *Dinoceras* are as follows:

<i>Measurements of Third Cervical Vertebra. (Dinoceras mirabile, No. 1255.)</i>		m.
Length of floor of neural canal (approximate),	-----	.055
Length of centrum, along under surface,	-----	.058
Vertical diameter of posterior epiphysis,	-----	.078
Antero-posterior extent of zygapophyses,	-----	.092
Diameter of lateral foramen (approximate),	-----	.020

THE FOURTH VERTEBRA. (Woodcuts 87 and 88, below.)

The fourth cervical vertebra in *Dinoceras* resembles, in its main characters, the one last described. The pre-zygapophyses are nearly flat. The neural canal is somewhat smaller. The process to protect the lateral foramen is more strongly developed, and the under surface of the centrum is without a distinctly marked keel.

The fourth vertebra in *Tinoceras grande* is similar, in its more important characters, although proportionally shorter, and its principal features are well shown in figures 87 and 88, below.

FIGURE 87.—Fourth cervical vertebra of *Tinoceras grande*, Marsh (No. 1040); front view.

FIGURE 88.—The same vertebra; side view.

f. lateral foramen; nc. neural canal; z. anterior zygapophysis; z'. posterior zygapophysis.
Both figures are one-fourth natural size.

The main dimensions of the fourth vertebra in one species each of *Dinoceras* and *Tinoceras* are given below.

Measurements of Fourth Cervical Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of floor of neural canal,	.055
Length of centrum, along under surface,	.054
Transverse diameter of anterior epiphysis,	.079
Vertical diameter of anterior epiphysis,	.075
Transverse diameter of posterior epiphysis,	.091
Vertical diameter of posterior epiphysis,	.075
Antero-posterior extent of zygapophyses,	.089
Diameter of lateral foramen,	.024
Transverse diameter of neural canal,	.043

Measurements of Fourth Cervical Vertebra. (Tinoceras grande, No. 1040.)

	m.
Length of floor of neural canal,	.042
Length of centrum, on under surface of vertebra,	.045
Transverse diameter of anterior face,	.100
Vertical diameter of anterior face,	.094
Transverse diameter of neural canal,	.055
Vertical diameter of neural canal,	.040
Diameters of lateral foramen,	.025-.015

THE FIFTH VERTEBRA. (Woodcuts 89 and 90, below.)

In the fifth cervical vertebra of *Dinoceras mirabile* (number 1255), the centrum is nearly round. The articular faces are distinctly concave, especially the posterior one. The neural canal is sub-triangular in transverse section. The arch to protect the lateral foramen is more depressed than in the preceding vertebra. The more important features of this vertebra are shown in figure 89, below.

FIGURE 89 —Fifth cervical vertebra of *Dinoceras mirabile*, Marsh (No. 1255); front view.

FIGURE 90.—The same vertebra; side view.

f. lateral foramen; *nc.* neural canal; *z.* anterior zygapophysis; *z'.* posterior zygapophysis.

Both figures are one-fourth natural size.

The principal measurements of the fifth vertebra in this specimen of *Dinoceras mirabile* are the following:

Measurements of Fifth Cervical Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of floor of neural canal,	.052
Length of centrum, along under surface,	.055
Transverse diameter of neural canal,	.046
Vertical diameter of neural canal,	.035
Transverse diameter of anterior epiphysis,	.079
Vertical diameter of anterior epiphysis,	.074
Transverse diameter of posterior epiphysis,	.089
Vertical diameter of posterior epiphysis,	.080
Antero-posterior extent of zygapophyses,	.083
Transverse diameter, across pre-zygapophyses,	.120
Transverse diameter, across post-zygapophyses,	.123
Diameter of lateral foramen (approximate),	.020

THE SIXTH VERTEBRA. (Woodcuts 91-94, below.)

The sixth cervical vertebra of *Dinoceras mirabile* (number 1255) has the articular faces of the centrum more transverse than in the preceding vertebra. The neural canal is sub-cordate in outline, and the transverse processes, to protect the lateral foramen, are more strongly developed than in the vertebra last described.

FIG. 91.

FIG. 92.

FIGURE 93.—Sixth cervical vertebra of *Dinoceras cuneum*, Marsh (No. 1042); front view.

FIGURE 94.—The same vertebra; side view.

nc. neural canal; z. anterior zygapophysis; z'. posterior zygapophysis.

Both figures are one-fourth natural size.

In the sixth vertebra of *Dinoceras cuneum*, there is a distinct neural spine, and the centrum is slightly quadrate in outline, as shown in figure 93. The latter is shorter than in the corresponding vertebra of *Dinoceras mirabile*, as seen by a comparison of figures 92 and 94.

Measurements of the sixth cervical vertebra in two individuals of *Dinoceras* are as follows:

Measurements of Sixth Cervical Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of floor of neural canal,	.049
Length of centrum, along under surface,	.055
Transverse diameter of neural canal,	.051
Vertical diameter of anterior epiphysis,	.076
Transverse diameter of posterior epiphysis,	.088
Vertical diameter of posterior epiphysis,	.078
Antero-posterior extent of zygapophyses,	.087

Measurements of Sixth Cervical Vertebra. (Dinoceras cuneum, No. 1042.)

	m.
Transverse diameter of centrum,	.111
Length of centrum, along under surface,	.053
Transverse diameter of neural canal,	.071
Vertical diameter of neural canal (approximate),	.044
Transverse diameter of anterior face of centrum,	.100
Vertical diameter of anterior face of centrum,	.092
Diameter of vertebra, across pre-zygapophyses (approximate),	.170
Diameters of lateral foramen,	.022-.034
Antero-posterior diameter of pedicel,	.026

THE SEVENTH VERTEBRA. (Plate XXII, figures 6-10.)

The seventh cervical vertebra of *Dinoceras mirabile* (number 1255) has the anterior face of the centrum nearly circular. The posterior face is expanded transversely, and its lateral margins are cut by the facets for the head of the first rib. The neural canal is distinctly sub-cordate in outline, and there is a rudimentary neural spine. The lateral foramen has disappeared, but the transverse process is notched below for the passage of the vertebral artery. These characters are shown in Plate XXII, figures 8 and 10.

Measurements of Seventh Cervical Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of floor of neural canal,	.046
Length of centrum, along under surface,	.051
Transverse diameter of neural canal,	.061
Vertical diameter of neural canal (approximate),	.046
Transverse diameter of anterior articular face (approximate),	.076

Diameters of articulation for first rib,	.022-.035
Diameter, across transverse processes (approximate),	.185

CHAPTER VI.

THE DORSO-LUMBAR VERTEBRÆ.

(Plates XXIII, XXIV, XXV, XXVI, LV and LVI.)

The trunk vertebræ in the *Dinocerata* are proportionally longer than those in the cervical region. The articular faces of the centra are likewise nearly flat, the most of them being distinctly concave. The epiphyses are usually loosely united to the centra, and thin, or imperfectly ossified, near the center. The number of trunk vertebræ in *Dinoceras* was apparently twenty-three.

THE FIRST DORSAL VERTEBRA. (Woodcuts 95-98, below.)

The first dorsal vertebra in *Dinoceras mirabile* (number 1255) has a slender, but elevated, neural spine, as shown in figure 95, below. It is distinguished from the adjoining elements of the column by the presence of elevated and oblique pre-zygapophyses, for articulation with the last cervical. These processes are much farther apart than the post-zygapophyses, and look obliquely upward, inward, and slightly backward, while the latter look almost directly downward. The pedicels of this vertebra stand mostly on the anterior half of the centrum. They are about twice as great in transverse as in antero-posterior diameter, and are directed well outward. The laminae form a much greater proportion of the neural arch than in the tapir, and are depressed at the middle, giving a somewhat triangular outline to the large neural canal. The epiphyses in this specimen are unossified for more than half their diameter, and imperfectly united to the centrum.

The transverse processes are short, and strongly tuberculated at the end. The articular surfaces for the heads of the first and second ribs are of about equal size, and sub-oval in outline. They are approximate at the sides of the centrum, being separated from each other by less than half their diameter. The face for the tubercular articulation of the first rib is of moderate size, oval in outline, concave from before backward, and much less so transversely. These articulations are about on a level with the floor of the neural canal, instead of below it, as in the tapir.

Both figures are one-fourth natural size.

The first dorsal in the type specimen of *Tinoceras anceps* (number 1030) is shown in figures 97 and 98, on page 80. In other specimens of *Tinoceras*, this vertebra presents the same general characters.

The principal dimensions of a first dorsal vertebra of *Dinoceras*, and of this vertebra in the type specimen of *Tinoceras*, are given below.

Measurements of First Dorsal Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of centrum, along floor of neural canal,	.048
Length of centrum, along inferior surface,	.058
Vertical diameter of anterior face of centrum,	.072
Transverse diameter of anterior face of centrum,	.075
Vertical diameter of posterior face of centrum,	.073
Transverse diameter of posterior face of centrum,	.073
Vertical diameter of neural canal,	.046
Transverse diameter of neural canal,	.065
Greatest diameter, across transverse processes,	.210
Diameter of pre-zygapophyses,	.030
Distance across pre-zygapophyses,	.140
Diameter of post-zygapophyses,	.031
Distance across post-zygapophyses,	.115
Diameters of anterior face for head of rib,	.030-.038
Diameters of posterior face for head of rib,	.027-.037
Diameters of face for tubercle of rib,	.025-.032
Transverse diameter of pedicel,	.044
Antero-posterior diameter of pedicel,	.022
Distance between faces for head of rib,	.015

Measurements of First Dorsal Vertebra. (Tinoceras anceps, No. 1030.)

	m.
Length of floor of neural canal,	.056
Length of centrum, along under surface,	.056
Transverse diameter of anterior face of centrum,	.070
Vertical diameter of anterior face of centrum (approximate),	.063
Transverse diameter of posterior face of centrum,	.080
Vertical diameter of posterior face of centrum,	.066
Transverse diameter of neural canal,	.068
Vertical diameter of neural canal (approximate),	.037
Diameters of anterior capitular face,	.031-.035
Diameters of posterior capitular face,	.033-.040
Antero-posterior diameter of pedicel,	.030
Transverse diameter of pedicel,	.029
Diameter of vertebra, across transverse processes,	.175

THE SECOND DORSAL VERTEBRA.

(Plate XXIII; and woodcuts 99-100, below.)

The second dorsal vertebra in *Dinoceras mirabile* (number 1255) is especially distinguished from the one last described by the neural spine, which is massive, and more inclined backward. The neural canal is sub-triangular in outline. The pre-zygapophyses are much smaller, less elevated, and look more directly upward. The centrum is somewhat longer than that of the first dorsal, and more expanded transversely. This vertebra is represented in Plate XXIII.

The second dorsal vertebra of *Dinoceras mirabile* (number 1212) has the neural spine still more massive, the neural canal more expanded transversely, and the articular faces of the centrum more nearly circular, as shown in figures 99 and 100, below.

In the genus *Tinoceras*, the second dorsal presents the same general features as in the vertebra above described.

FIG. 99.

FIG. 100

FIGURE 100.—The same vertebra; side view.

n. neural canal; *s.* neural spine; *z'*. posterior zygapophysis.

Both figures are one-fourth natural size.

The more important measurements of the second dorsal vertebra of one specimen of *Dinoceras* are as follows:

Measurements of Second Dorsal Vertebra. (Dinoceras mirabile, No. 1255.)

	m.
Length of centrum, along floor of neural canal,	.048
Length of centrum, along under surface,	.060
Transverse diameter of anterior face of centrum,	.073
Vertical diameter of anterior face of centrum,	.075
Transverse diameter of posterior face of centrum,	.075
Vertical diameter of posterior face of centrum,	.070
Transverse diameter of neural canal,	.065
Vertical diameter of neural canal,	.057
Diameters of anterior capitular face,	.029-.033
Diameters of posterior capitular face,	.029-.040
Antero-posterior diameter of pedicel,	.025
Transverse diameter of pedicel,	.040
Diameter of vertebra, across transverse processes,	.200
Diameter of vertebra, across post-zygapophyses,	.080
Least transverse diameter of neural spine,	.035

THE THIRD DORSAL VERTEBRA. (Woodcuts 101 and 102, below.)

The third dorsal vertebra in the genera *Dinoceras* and *Tinoceras* differs from the vertebra in front of it, in having the neural spine less robust, and the transverse processes, and the faces for the heads of the ribs on the centrum, more elevated. The centrum itself is less expanded transversely, and its length is greater.

FIGURE 101.—Third dorsal vertebra of *Uintatherium segne*, Marsh (No. 1194); front view.

FIGURE 102.—The same vertebra; side view.

d. transverse process; *nc.* neural canal; *r.* face for head of rib; *r'.* face for tubercle of rib; *s.* neural spine.

Both figures are one-fourth natural size.

The third dorsal in *Uintatherium segne* (number 1194) shows essentially the same characteristics, and is represented in figures 101 and 102, above.

THE MEDIAN AND POSTERIOR DORSAL VERTEBRÆ.

(Plate XXIV; and woodcuts 103-105, below.)

In the dorsal vertebræ of *Dinoceras*, behind the third, the neural spine gradually becomes shorter and weaker, and the neural canal, transversely oval in outline. The transverse processes are more elevated, and shorter. The centrum becomes more compressed below, so that the articular faces are sub-triangular in outline, as shown in Plate XXIV, figure 2.

In the posterior dorsals, the neural spine is quite short, and weak. The anterior zygapophyses have their articular faces recurved, as in the ruminant mammals. The neural canal is a broad oval in transverse outline. The transverse processes are much elevated, and the articular faces for the ribs on these, and on the centrum below, gradually become smaller. The centrum is longer, distinctly keeled below, and its articular faces are triangular in outline, the three sides being nearly equal. These features are shown in figures 103-105.

The last dorsal vertebra of *Dinoceras mirabile* (number 1215) is represented in Plate XXIV, figures 5-9. A posterior dorsal of another species is shown below.

FIGURE 103.—Posterior dorsal vertebra of *Dinoceras lucare*, Marsh (No. 1038); front view.

FIGURE 104.—The same vertebra; side view.

FIGURE 105.—The same vertebra; back view.

n. neural canal; r. face for head of rib; r'. face for tubercle of rib; s. neural spine; z. anterior zygapophysis; z'. posterior zygapophysis.

All the figures are one-fourth natural size.

THE LUMBAR VERTEBRÆ.

(Plates XXV and XXVI.)

The last four lumbar vertebræ of the type specimen of *Dinoceras mirabile* (number 1036) are preserved, and are figured in Plates XXV and XXVI. The centra are proportionally much longer than in the mastodon, and the most anterior of the four is excavated at the sides, and keeled below, so as to be nearly triangular in a vertical section near the middle. The excavation becomes less decided in the succeeding vertebræ, which are more nearly circular in section. The keel disappears upon the last lumbar, which has its under surface strongly roughened, especially near the posterior margin.

The epiphyses of all these vertebræ are imperfectly united with the centra, and are deficient in ossification near the center, forming only thin, and, in some cases, narrow rings of bone. The deficiency of ossification increases the apparent concavity of the articular faces of the centrum. These faces also become more oval transversely on the posterior vertebræ, and especially upon the last lumbar vertebra.

The neural canal in all the lumbar vertebræ is large, but has been considerably reduced, in the vertebræ of this specimen, by crushing.

The zygapophyses in the lumbar region are strongly articulated together. The pre-zygapophyses present a curved surface, bending around, and firmly grasping, the semi-cylindrical post-zygapophyses, which are inserted into them. This form of articulation is found among living Artiodactyls, and existed also in the Oreodons of the Miocene; while in the Perissodactyl group, and in Proboscidiæ, the zygapophyses of this region are loosely applied to each other by nearly flat surfaces.

The keel on the under surface of the centrum is stout and short on the second vertebra from the sacrum, where it first appears in this specimen, and is strongest on the anterior part of the centrum. On the next preceding vertebra, it is somewhat thinner, but more elongated, extending along the whole under surface of the centrum. On the fourth vertebra from the sacrum, it becomes thin, and even sharp in front.

The transverse processes are flattened, especially above, and directed nearly horizontally outward. They are much more elongated than in the mastodon, and appear to have been proportionally much stronger than in the tapir.

The principal dimensions of four lumbar vertebræ of the type specimen of *Dinoceras mirabile* are as follows :

Measurements of Fourth Lumbar Vertebra from Sacrum. (Dinoceras mirabile, No. 1036.)

	m.
Length of centrum (anterior epiphysis wanting),	.080
Vertical diameter of centrum,	.087
Vertical diameter of posterior face of centrum,	.075
Transverse diameter of posterior face of centrum (approximate),	.088

Measurements of Third Lumbar Vertebra from Sacrum. (Dinoceras mirabile, No. 1036.)

	m.
Length of centrum,	.085
Transverse diameter of anterior epiphysis,	.091
Vertical diameter of anterior epiphysis,	.080
Transverse diameter of posterior epiphysis,	.091
Vertical diameter of posterior epiphysis,	.078

Measurements of Second Lumbar Vertebra from Sacrum. (Dinoceras mirabile, No. 1036.)

	m.
Length of centrum,	.086
Transverse diameter of anterior epiphysis (approximate),	.090
Vertical diameter of anterior epiphysis,	.080
Transverse diameter of posterior epiphysis (approximate),	.095
Vertical diameter of posterior epiphysis,	.083

Measurements of last Lumbar Vertebra. (Dinoceras mirabile, No. 1036.)

	m.
Length of centrum,	.083
Transverse diameter of anterior epiphysis (approximate),	.095
Vertical diameter of anterior epiphysis,	.080
Transverse diameter of posterior epiphysis (approximate),	.105
Vertical diameter of posterior epiphysis,	.075

CHAPTER VII.

THE FORE LIMBS.

(Plates XXVII-XXXVIII, LV, and LVI.)

THE limb bones in the *Dinocerata* are nearly or quite solid, and this is true of all the skeleton, a portion of the skull alone excepted.

The fore limbs in the *Dinocerata* have a general resemblance to those of Proboscidiens. The different segments, however, are more inclined to each other, and the bones that compose them are stouter, and more massive.

THE SCAPULA. (Plate XXVII.)

The scapula of *Dinoceras mirabile*, in its general form, is similar to that of the elephant. It is triangular in outline, with the anterior, or coracoid, border slightly longer than either of the other two margins, which are about equal to each other, if the glenoid border be considered as including the glenoid cavity. The coracoid border is excavated by a broad rounded emargination, just above the coracoid process, but beyond this sinus, it runs nearly straight to the apex of the bone, which is more acute than in the mastodon.

The supra-scapular border is moderately curved throughout, and the posterior angle appears to be less acute than in the Proboscidiens. The glenoid border is nearly in a line with the glenoid cavity, so that the constriction above the cavity is scarcely evident in the posterior margin of the bone.

The external surface of the scapula is divided into two unequal fossæ. The anterior of these, or pre-scapular fossa, extends the entire length of the bone, but is less than half as wide as the post-scapular fossa, from which it is divided by a thick and stout spine. The latter is less elevated than in the elephant and mastodon, and less expanded, but extends farther downward, nearly to the level of the glenoid cavity. It is destitute of the curved posterior process seen in the elephant and mastodon.

The post-scapular fossa is strongly roughened near the posterior angle, which is rounded.

The glenoid cavity is only moderately concave transversely, and somewhat broader behind than before.

The inner surface of the scapula is for the most part smooth, except over a large quadrilateral area in the region of the apex. The supra-scapular border is ossified separately from the body of the bone.

The coracoid is firmly united to the scapula in *Dinoceras mirabile* (number 1215), and forms a rounded salient process, projecting freely in front of the glenoid cavity. Seen from the front, it appears to be tri-lobed in outline.

The main dimensions of the scapula in one specimen of *Dinoceras mirabile* are as follows:

<i>Measurements of Left Scapula. (Dinoceras mirabile, No. 1215.)</i>		m.
Antero-posterior diameter of glenoid cavity,		.115
Transverse diameter of glenoid cavity,		.090
Greatest vertical diameter of scapula,		.575
Greatest horizontal diameter,		.480
Length of coracoid border,		.570
Length of supra-scapular border,		.390
Length of glenoid border,		.350
Height of acromion above glenoid cavity,		.120
Greatest diameter of pre-scapular fossa,		.140
Greatest diameter of post-scapular fossa,		.310

THE HUMERUS.

(Plate XXVIII; and woodcuts 106-107, below.)

The humerus of *Dinoceras* is a strong bone, presenting roughened and tuberculated surfaces, evidently for the attachment of powerful muscles. In this respect, it is in strong contrast with the comparatively smooth femur, and a glance at the structure of the skeleton, as shown in the restorations in Plates LV and LVI, will suggest a reason for this difference.

The hind leg of *Dinoceras*, like that of the elephant, could be straightened, so that the weight of the hinder part of the body was supported by a vertical column of bones, rising from the ankle joint to the pelvis, and comparatively little muscular action was required to keep the bones in the requisite position. The elbow joint, on the contrary, was not capable of sufficient extension to bring the radius and ulna into a line with the humerus, but the weight of the fore part of the body was supported, as in ordinary quadrupeds, by a long column with more or less flexure near the middle. Constant muscular action was therefore necessary to sustain the weight of this part of the body. The heavy and strongly armed head added still more to the muscular efforts required of the fore limbs, during progression, or even while standing at rest.

The proximal end of the humerus (Plate XXVIII, figure 3, *a*) presents a large rounded articular face, or head, more convex antero-posteriorly than from side to side. The axis of the head of the humerus forms an angle of nearly 30° with that of the shaft. This angle, while greater than that seen in the same bone of the elephant, is much less than in most quadrupeds.

The great tuberosity of the humerus is prominent, but not elevated, and is separated, by a shallow and narrow bicipital groove, from the low lesser tuberosity. The great tuberosity is about as large as in the elephant, but does not extend so high, not rising to the head of the humerus. It is strongly tuberculated and roughened, and is continued down the anterior and outer part of the shaft into a prominent ridge below

the middle of the bone. Here it unites with the oblique, and well developed, deltoid ridge, then descends rapidly, and ends in a roughened surface just above, and inside of, the coronoid fossa. The deltoid ridge is strong, oblique, and elongated, as is well shown in the back view of the humerus, Plate XXVIII, figure 3. It does not, however, rise into a hook-like process, as in the rhinoceros. The bicipital groove is single, as in the elephant, and presents no median ridge. The lesser tuberosity is small and low, and wholly below the head, which is broad and extensive, covering much the greater part of the superior aspect of the bone, and extending forward to the bottom of the bicipital groove.

The shaft of the humerus is most constricted at a point nearly three-fourths of the way toward the distal end, and here is distinctly triangular in section, one of the angles projecting forward, as seen in Plate XXVIII, figure 1. Above and below this point, the shaft expands, and is more flattened, especially distally. Here it is excavated in front, as usual, by a large rounded and deep coronoid fossa, placed well toward the outer, or radial, side, as shown in Plate XXVIII, figure 1. The posterior surface is hollowed out, medially, by a comparatively shallow anconeal fossa, as shown in figure 3 of the same Plate. The coronoid fossa in some specimens (number 1224) is even deeper than the anconeal, and is always distinct and rounded. The anconeal fossa is also rounded in general outline, median in position, and is carried but little below the trochlear articular face.

The posterior surface of the humerus is bounded, on the inner side, by a ridge running almost the entire length of the shaft. This ridge commences above, near the posterior part of the lesser tuberosity, and the postero-internal angle of the head, and runs nearly straight down the shaft of the humerus, terminating in an expanded and tubercular tract, on the inner condyle. On this ridge, and about the middle of the shaft, nearly opposite the strongest part of the deltoid ridge, is another roughened area, often, as in the specimen figured (Plate XXVIII, figures 1, 2 and 3), rising into a distinct trochanter-like eminence, apparently for the insertion of the *latissimus dorsi* muscle. At the lower end of the humerus, this ridge

ends in a large and prominent inner condyle, which does not, however, extend far back of the trochlear surface, as seen in Plate XXVIII, figure 1, *a*.

The outer condyle is nearly on the same level as the inner, and extends to about the same distance laterally, from the axis of the bone, as seen in Plate XXVIII, figures 1 and 3. Above, it descends rapidly to the shaft of the bone, and presents only a short and moderately rugose, or nearly smooth, supinator ridge.

The trochlear articulation considerably resembles that of the elephant, but is placed a little more obliquely to the axis of the bone. The radius articulated, during life, with the whole of the anterior part of this surface, and the ulna, with the whole of the posterior part, the former bone being, at the proximal end, in front of the latter, and scarcely at all on the outer side. The outer part of the trochlear surface is more rounded in both directions than the inner, the surface of which is only moderately curved in a transverse direction.

The shaft of the humerus is more or less cancellated within, as shown in the woodcuts, figures 106 and 107, but is destitute of any medullary cavity.

FIG. 106.

FIG. 107.

FIGURE 106.—Section of humerus of *Dinoceras mirabile*, Marsh (No. 1215); near proximal end.

FIGURE 107.—Section of humerus of *Dinoceras mirabile* (No. 1208); below middle.

Both figures are one-fourth natural size.

Measurements of the humerus in four individuals of *Dinoceras* are as follows:

<i>Measurements of Left Humerus. (Dinoceras mirabile, No. 1245.)</i>		m.
Total length of humerus,		.555
Antero-posterior diameter of head,		.136
Transverse diameter of head,		.120
Greatest diameter of proximal end,		.220
Least antero-posterior diameter of shaft,		.070
Least transverse diameter of shaft,		.080

Transverse diameter, through condyles,	m. .200
Transverse diameter of trochlear surface,	.127
Antero-posterior diameter of trochlear surface, ulnar side,	.109
Antero-posterior diameter of trochlear surface, radial side,	.091
Antero-posterior diameter of trochlear surface, least,	.078
Thickness of bone between coronoid and anconeal fossæ,	.016

Measurements of Left Humerus. (Dinoceras mirabile, No. 1208.)

Least antero-posterior diameter of shaft,	m. .064
Transverse diameter, through condyles,	.184
Transverse diameter of trochlear surface,	.124
Antero-posterior diameter of trochlear surface, ulnar side,	.100
Antero-posterior diameter of trochlear surface, radial side,	.095
Antero-posterior diameter of trochlear surface, least,	.080
Thickness of bone between coronoid and anconeal fossæ,	.018

Measurements of Right Humerus. (Dinoceras mirabile, No. 1212.)

Least antero-posterior diameter of shaft,	m. .058
Transverse diameter through condyles,	.183
Transverse diameter of trochlear surface,	.115
Antero-posterior diameter of trochlear surface, ulnar side,	.098
Antero-posterior diameter of trochlear surface, radial side,	.080
Antero-posterior diameter of trochlear surface, least,	.072
Thickness of bone between coronoid and anconeal fossæ,	.014

Measurements of Right Humerus. (Dinoceras mirabile, No. 1215.)

Antero-posterior diameter of head,	m. .140
Transverse diameter of head,	.138
Greatest diameter of proximal end,	.220
Antero-posterior diameter of trochlear surface, ulnar side,	.116

THE FOREARM. (Plates LV and LVI.)

The two bones of the forearm in the *Dinocerata* are quite distinct throughout in all the specimens observed, and, exclusive of the olecranon process of the ulna, differ but little in size. The articular surface for the humerus is formed in about equal parts by each bone, except that it is medially produced backward on the ulna upon the beak of the olecranon.

The distal articular face for the carpus was borne more by the radius than the ulna, but the inequality, in size, of the articular faces was comparatively slight. The lunar articulated distinctly with both bones.

The articular surfaces of the radius and the ulna for each other were nearly parallel with the axes of those bones, and allowed of little else than a slight antero-posterior gliding motion. The roughened and co-adapted surfaces of the bones indicate that, during life, all movements of pronation and supination were prevented by powerful ligaments.

The radius does not appear so distinctly to cross the ulna as in the Proboscidiæ, being, at the upper end, in front of that bone, and proportionally much larger, then passing down obliquely inward to a position within the distal end of the ulna.

The proportion of the two bones to each other is much nearer that seen in the rhinoceros and hippopotamus, than that in the elephant.

THE RADIUS. (Plate XXIX; and woodcuts 108-109, below.)

The radius in *Dinoceras* is a strong bone, with its shaft about equal in size to that of the ulna. It is considerably larger than that bone at the lower end, and smaller at the upper end.

The head, or superior articular face, occupies the entire surface of the proximal end. This surface is elongate oval in outline, the long diameter being placed transversely, and nearly twice as great as the short diameter. The latter is antero-posterior in direction, in the ordinary, nearly vertical position of the bone. It crosses the surface of the bone nearly in the middle, instead of toward the inner side of the middle, as in most Ungulates. Antero-posteriorly, the articular surface is concave throughout, but transversely, it is convex on the inner side, and concave on the outer side of the middle line. The inner half of the articular surface is thus traversed by a low antero-posterior ridge, or elevation, which moves upon the groove in the distal articular face of the humerus.

The proximal surface of the radius differs from that of the elephant in being proportionally much larger, and extending quite across the humeral articular surface. It differs from that of the tapir, and the hippopotamus, in having only a single antero-posterior ridge, as in the rhinoceros. It still differs from that of the rhinoceros, in the fact, that a transverse section

is concave in its outer half, and convex in its inner half, while in the rhinoceros, such a section is concave at each end, and convex only near the median portion.

On the side of the radius toward the ulna, is a narrow articular surface for that bone, becoming broader toward the outer end.

The shaft of the radius is smallest at a point about one-third of the way from the proximal, toward the distal end. Above this point, the bone expands rather rapidly toward the head. It is much roughened, especially on the side toward the ulna, with which, however, it forms no bony union; nor are the bones roughened, or grooved for close adaptation to each other, as in the tapir and rhinoceros. The bicipital tuberosity is well developed, and placed rather low down on the side of the shaft, instead of on the front part of it. The distal end of the shaft is large, rough, and oblique, and presents no smooth grooves for tendons.

The distal articular face is divided by a median ridge into two sub-equal facets, for the scaphoid and lunar bones of the carpus. These facets are confluent along the summit of the median ridge. That for the scaphoid is semi-circular in outline, and concave in both directions, while that for the lunar is four-sided, much broader in front than behind, and concave throughout. Near the back part of the ulnar side of this facet, the articular face is continued into a small tract on the lateral surface of the radius, where it comes in contact with the ulna.

The shaft of the radius has an interior cancellated structure, as shown in the figures below, but no medullary cavity.

FIG. 108.

FIG. 109.

FIGURE 108.—Section of radius of *Dinoceras mirabile*, Marsh (No. 1195).

FIGURE 109.—Section of radius of *Dinoceras mirabile*, Marsh (No. 1234).

Both figures are one-fourth natural size.

Measurements of the radius in three individuals of *Dinoceras* are the following:

Measurements of Left Radius. (Dinoceras mirabile, No. 1208.)

Total length of radius,	m. .380
Greatest diameter of proximal end,	.098
Antero-posterior diameter of proximal end,	.061
Least diameters of shaft,	.032-.053
Transverse diameter of distal end,	.102
Antero-posterior diameter of distal end,	.080
Diameters of articulation for humerus,	.052-.094
Antero-posterior diameter of face for scaphoid,	.055
Transverse diameter of face for scaphoid,	.039
Antero-posterior diameter of face for lunar,	.056
Transverse diameter of face for lunar,	.045
Transverse diameter of distal articular surfaces,	.082

Measurements of Left Radius. (Dinoceras mirabile, No. 1206.)

Total length of radius,	m. .254
Greatest diameter of proximal end,	.116
Antero-posterior diameter of proximal end,	.071
Least diameters of shaft,	.062-.041
Transverse diameter, distal end,	.011
Antero-posterior diameter, distal end,	.097
Diameters of articulation for humerus,	.060-.108
Antero-posterior diameter of articulation for scaphoid,	.065
Transverse diameter of articulation for scaphoid,	.040
Antero-posterior diameter of articulation for lunar,	.065
Transverse diameter of articulation for lunar,	.055
Transverse diameter of distal articular surfaces,	.093

Measurements of Right Radius. (Dinoceras, No. 1548.)

Length of radius,	m. .400
Greatest diameter of proximal end,	.112
Antero-posterior diameter of proximal end,	.070
Least diameters of shaft,	.063-.035
Transverse diameter of distal end,	.108
Antero-posterior diameter of distal end,	.090
Diameters of articulation for humerus,	.060-.104
Transverse diameter of articulation for scaphoid,	.047
Antero-posterior diameter of articulation for lunar,	.055
Transverse diameter of articulation for lunar,	.045
Transverse diameter of distal articular surfaces,	.092

THE ULNA. (Plate XXX; and woodcuts 110-111, below.)

The ulna in the *Dinocerata* is a solid and heavy bone, longer than the radius, as usual, by the length of the olecranon process. Except near the distal end, it is larger and stouter than that bone, to which it was united in life by ligaments only, but in such a manner as to allow of little motion between them. The shaft of the ulna always made, even at its utmost extension, a distinct angle with that of the humerus.

The ulna in *Dinoceras* is proportionally less robust than in the elephant. Its distal end is comparatively smaller than in that animal, and, at the proximal end, a much smaller proportion of the articular surface for the humerus is furnished by the ulna.

The olecranon process is robust, as in the Proboscidiens, but it is carried farther above the articular surface, and less directly behind it, than in that group. It is much higher within than without, and posteriorly, it is strongly roughened as low down as the middle of the humeral articulation. It is only moderately produced backward, and descends into a broad ridge, insensibly blending below with the shaft of the bone.

Below the humeral articular surface, the shaft of the ulna is sub-triangular in section, or, near the distal end, somewhat quadrilateral. Along the posterior and outer side of the bone, is a rounded ridge, running from the olecranon process above, to the outer angle of the articular face below.

The face by which the ulna is applied to the radius is broadly excavated, and strongly roughened above, where it is nearly on the front surface of the bone. It is moderately flattened along the shaft of the bone, and is carried around to the inner surface toward the distal end, where it is broad, flat, and distinctly roughened.

The anterior face of the bone is also flattened near the distal end, and separated from the outer face by a ridge, which extends upward to near the middle of the shaft. The postero-external face of the bone is flattened, or only moderately rounded, and is somewhat excavated behind the lower part of the humeral articulation.

This articulation presents a striking difference in direction from that seen in the corresponding face on the ulna of the elephant and mastodon. It is so placed on the shaft of the bone as to look almost directly forward, and only very slightly upward, instead of looking nearly upward, as in the mastodon. It forms, comparatively, a much smaller part of the face for the humeral trochlea.

In shape, this articulation is distinctly tri-lobate. One rounded lobe, convex from side to side, runs backward and upward to the summit of the beak of the olecranon. A second, and large lobe, moderately concave in both directions, runs inward, articulating with the ulnar portion of the trochlea of the humerus. An outer, small and flattened, lobe articulates with the posterior part of the radial surface of the trochlea. The front, or lower, outline of the articular face is moderately concave, and adapted to the surface of the radius by a narrow face, becoming wider toward each extremity.

The distal end of the ulna is terminated by an articular surface, which is somewhat quadrant-shaped. The inner and posterior outlines are nearly straight, and meet at a right angle, while the anterior and outer margins are formed by a curved line.

This face is convex in an antero-posterior direction, strongly so behind. In a transverse direction, it is moderately concave, except near the inner edge, where it is broadly beveled off, for union with the lunar bone of the carpus.

Much the larger part of the distal articular face of the ulna articulated, during life, with the pyramidal bone, or the cuneiform bone of many anatomists.

Posteriorly, a surface was presented for the pisiform, and, on the inner side, a narrow beveled surface united with the lunar bone.

Farther within, and on the surface of the shaft of the bone, a small surface was presented to the radius, although the two bones, as already stated, were strongly fixed, during life, in their relation to each other.

The inner texture of the shaft of the ulna is similar to that of the radius, as indicated in the sections represented below, figures 110 and 111.

FIG. 110.

FIG. 111.

FIGURE 110.—Section of ulna of *Dinoceras lucare*, Marsh (No. 1038).FIGURE 111.—Section of ulna of *Dinoceras mirabile*, Marsh (No. 1548).

Both figures are one-fourth natural size.

The principal dimensions of the ulna in three individuals of *Dinoceras* are as follows:

Measurements of Left Ulna. (Dinoceras mirabile, No. 1206.)

	m.
Total length of ulna,	.530
Diameters of proximal end,	.095-.140
Transverse diameter of shaft, behind humeral articular face,	.055
Diameter of shaft, through humeral articular face,	.097
Diameters of shaft, near the middle,	.057-.081
Antero-posterior diameter of shaft, near distal end,	.085
Transverse diameter of shaft, near distal end,	.067
Transverse diameter of humeral articulation, greatest,	.143
Transverse diameter of humeral articulation, least,	.060
Antero-posterior diameter of humeral articulation, at the middle,	.085
Antero-posterior diameter of humeral articulation, inner lobe,	.063
Antero-posterior diameter of humeral articulation, outer lobe,	.045
Transverse diameter of distal articular surface,	.076
Antero-posterior diameter of distal articular surface,	.070
Least and greatest diameters of distal articular surface,	.067-.097

Measurements of Right Ulna. (Dinoceras mirabile, No. 1232.)

	m.
Total length of ulna,	.555
Diameters of proximal end,	.098-.130
Transverse diameter of shaft, behind humeral articulation,	.065
Diameter of shaft, through humeral articulation,	.103
Diameters of shaft, near the middle,	.067-.077
Antero-posterior diameter of shaft, near distal end,	.095
Transverse diameter of shaft, near distal end,	.084
Least transverse diameter of humeral articulation,	.058
Antero-posterior diameter of humeral articulation, at the middle,	.086

THE FORE LIMBS.

CHAPTER VIII.

THE FORE LIMBS. (Continued.)

(Plates XXXI-XXXVIII, LIV, LV and LVI).

The fore foot in all the *Dinocerata* is larger than the hind foot. The bones composing it are comparatively short and massive. There were five well developed digits, as in Proboscidiens, but the carpal bones were interlocked with the metacarpals, as in Perissodactyls. The general appearance of the fore foot in *Dinoceras mirabile* is well shown in Plate LIV, figure 1. The hind foot is represented in figure 2 of the same Plate. The feet were plantigrade, as in the elephant, and in their more important characters were much like those of *Coryphodon*.

THE CARPAL BONES.

(Plates XXXI-XXXIV; and woodcuts 112-124, below.)

There are eight separate carpal bones in the fore foot of all the *Dinocerata*, and a ninth, the central bone, may be separate in very young animals, and, in adults, either lost or consolidated with the scaphoid, or the trapezoid.

THE SCAPHOID.

(Plate XXXI, figures 1-6, Plate LIV, figure 1, s;
and woodcuts 112-113, below.)

The scaphoid in the *Dinocerata* is a peculiar bone of characteristic shape. It is quite large, its length, along the axis of the limb, being greater than that of any other bone of the carpus. Proximally, it presents a strongly rounded, almost hemispherical surface, for articulation with the radius. This articular face covers the entire proximal end of the bone, and is oblique to its axis, the side toward the lunar being much higher than the opposite side. The ulnar side, in apposition with the lunar, has a proximal articular surface confluent with the radial surface, and extending less than one-fourth the length of the bone.

Distally, the scaphoid presents two confluent articular faces, one for the trapezium, and a second smaller one, somewhat in front of the other, for the trapezoid. These two faces are but indistinctly separated from each other, and are, for most of their extent, convex in both directions.

The ulnar side of the bone also presents two confluent, but well marked, articular surfaces, making an obtuse angle with each other. Of these, the anterior is nearly flat, and joins the lunar. The posterior is more convex, and adapted to the magnum. This face does not reach the anterior angle of the bone, so that the magnum is supported in front by the lunar alone, but articulates behind with the scaphoid also.

The projection supporting these two faces may perhaps represent the central bone, coalesced with the scaphoid. The latter shows no face for a separate central bone.

The two proximal articular faces are well separated from the four at the distal end of the scaphoid bone by a large area of non-articular surface. This tract becomes elevated, and strongly tuberculated, on the exterior side of the bone, while it is smoother, and somewhat excavated, on the side turned toward the lunar and the magnum.

In Plate LIV, figure 1, the scaphoid and lunar bones are slightly out of position, but every anatomist will see their true relations to each other.

The scaphoid in *Dinoceras laticeps* (number 1264), like most others (except number 1208), shows, near the distal portion of the radial side, below the rugose surface, a deep and somewhat oblique depression.

The scaphoid in two specimens of *Dinoceras* are represented in the figures below.

FIG. 112.

FIG. 113

FIGURE 112.—Left scaphoid of *Dinoceras laticeps*, Marsh (1264); side view.FIGURE 113.—Right scaphoid of *Dinoceras mirabile*, Marsh (1200); side view.

r. face for radius; *tm.* face for trapezium; *tr.* face for trapezoid.

Both figures are one-half natural size.

The principal dimensions of the scaphoid in three individuals of *Dinoceras* are as follows:

Measurements of Left Scaphoid. (Dinoceras mirabile, No. 1208.)

	m.
Length of longitudinal axis of scaphoid,	.077
Length of transverse axes,	.049-.049
Antero-posterior diameter of radial articular surface,	.051
Transverse diameter of radial articular surface,	.045
Antero-posterior diameter of distal articular surface,	.070
Transverse diameter of distal articular surface,	.044

Measurements of Right Scaphoid. (Dinoceras mirabile, No. 1200.)

	m.
Length of longitudinal axis of scaphoid,	.071
Length of transverse axes,	.073-.054
Antero-posterior diameter of radial articular surface,	.046
Transverse diameter of radial articular surface,	.038
Antero-posterior diameter of distal articular surface,	.066
Transverse diameter of distal articular surface,	.038

Measurements of Left Scaphoid. (Dinoceras laticeps, No. 1264.)

	m.
Length of longitudinal axis of scaphoid,	.086
Length of transverse axes,	.051-.060
Antero-posterior diameter of radial articular surface,	.060
Transverse diameter of radial articular surface,	.046
Antero-posterior diameter of distal articular surface,	.082
Transverse diameter of distal articular surface,	.050

THE LUNAR.

(Plate XXXI, figures 7-12, Plate LIV, figure 1, *l*; and woodcuts 114-116, below.)

The lunar bone in the *Dinocerata* (Plate XXXI, figures 7-12) bears some resemblance to the corresponding bone in the elephant, but differs widely from it in having its proximal surface, for articulation with the radius and ulna, convex throughout, instead of being for the most part concave. The distal surface, also, presents two distinct articular faces, instead of being covered with a single large face, as in the elephant.

The exterior surface of the lunar, or the face seen in front when the bone is in its natural position with the other bones of the foot, is represented on Plate XXXI, figure 7. This surface is coarsely roughened, and is widest above. Only a small portion of the edges of any of the articular surfaces can be seen in this view.

The inner angle of the distal end of the lunar in *Dinoceras* (numbers 1215, 1229, and 1230) is truncated by a small face for articulation with the trapezoid bone, as shown in figure 7, and also in woodcut 114, below. On one specimen (number 1575), which may belong to *Uintatherium*, this face is large and convex. In number 1254, the face is smaller than in the specimens figured. The articulation of the lunar with the trapezoid, or perhaps the trapezo-central bone, occurs also in *Coryphodon*, *Mastodon*, and the elephant, especially the African species.

The lateral surface of the bone turned toward the scaphoid, and articulating with it, is shown on Plate XXXI, figure 8. This side has two faces for articulation with the scaphoid. The upper one of these runs along nearly the whole extent of the superior margin of the bone, and is confluent with the surface for articulation with the radius, and hardly to be distinguished from it. A second articular face for union with the scaphoid is broader and more flattened than the first, and extends along rather more than half of the distal margin near its front, or anterior, end. Behind this articular surface, the bone is produced into a short, hook-shaped process sustaining the concave portion of the distal articulations.

The posterior surface of the lunar is shown on the same Plate, figure 9, and presents no articular faces. The lateral surface turned toward the

pyramidal is shown in figure 10. Two narrow and approximate faces are seen on this surface, becoming somewhat wider, and approaching each other behind. These faces vary greatly in the degree to which they are developed in different specimens.

The upper, or proximal, surface is confluent with the ulnar facet, while the lower, or distal, one is continuous with the face for the unciform, but usually well distinguished from it by a ridge.

The proximal surface (figure 11), articulating with the radius, is more or less quadrangular in outline, broader in front, sometimes so much so as to become sub-triangular in outline (number 1218). It is well rounded in both directions throughout, the smooth articular face for radius and ulna being carried over on each side to join both the scaphoid and the pyramidal faces.

FIGURE 114.—Right lunar of *Dinoceras mirabile*, Marsh (No. 1230); front view.

FIGURE 115.—Left lunar of *Tinoceras ingens*, Marsh (No. 1504); bottom view.

FIGURE 116.—Left lunar of *Tinoceras ingens* (No. 1219); front view.

m. face for magnum; *p.* face for pyramidal; *r.* face for radius; *s.* face for scaphoid; *tr.* face for trapezoid; *un.* face for unciform.

All the figures are one-half natural size.

The distal surface (figure 12) is divided into two articular faces, supporting in part the magnum and the unciform. These faces are confluent, and sometimes hardly to be distinguished in front, but, on the posterior part of the surface, they are separated by a more or less distinct rounded ridge. Both these faces are nearly flat transversely in front, and somewhat concave behind. In an antero-posterior direction, they are convex in front, and concave behind.

In the right lunar of *Dinoceras mirabile* (number 1230), the distal face for articulation with the scaphoid makes less than a right angle with the face for the magnum. instead of an obtuse angle, as in most other specimens.

The lunar bone in *Tinoceras* presents no articular face for the trapezoid, and is much produced posteriorly, thus distinguishing it from the lunar in the genus *Dinoceras*. Its main features are shown in the woodcuts, 115 and 116, above.

The more important measurements of the lunar bone in four individuals of the *Dinocerata* are as follows:

Measurements of Right Lunar. (Dinoceras mirabile, No. 1230.)

	m.
Length of longitudinal axis of lunar,	.050
Antero-posterior diameter of proximal end,	.059
Transverse diameter of proximal end,	.056
Antero-posterior diameter of distal end,	.075
Transverse diameter of distal end,	.046

Measurements of Left Lunar. (Tinoceras ingens, No. 1503.)

	m.
Length of longitudinal axis of lunar,	.051
Antero-posterior diameter of proximal end,	.061
Transverse diameter of proximal end,	.053
Antero-posterior diameter of distal end,	.083
Transverse diameter of distal end,	.047

In this specimen, the distal face for the scaphoid is quite large, and encroaches on the face for the magnum.

Measurements of Right Lunar. (Tinoceras ingens, No. 1504.)

	m.
Length of longitudinal axis of lunar,	.054
Antero-posterior diameter of proximal end,	.062
Transverse diameter of proximal end,	.065
Antero-posterior diameter of distal end,	.088
Transverse diameter of distal end,	.050

THE PYRAMIDAL.

(Plate XXXII, figures 1-6, Plate LIV, figure 1, *p*;
and woodcuts 117-118, below.)

The pyramidal bone in the *Dinocerata* bears a considerable resemblance to the corresponding bone in the elephant, and has, in general, a similar shape, and similar arrangement of articular faces.

Plate XXXII, figure 1, represents the outer, or dermal, surface of the bone, as seen in its natural position in the foot, and shows a portion only of the saddle-shaped articular face for the ulna.

The anterior view of the bone (figure 2) shows but little of the articular faces, although, on the side turned toward the lunar, may be seen a short articular face running along the distal portion of the surface. This face is seen more clearly in figure 3, and is confluent with the lower, or distal, face supporting the unciform, but makes a considerable angle with it.

In the posterior view of the bone (figure 4), the oblique articulation for the pisiform is shown. This articular face, like most of the lateral ones among the carpal bones, is of variable shape, and often fails to show the deep emargination at the side, seen in the specimen figured. Along the upper margin, where this face is confluent with the ulnar articular face, the two are separated by a nearly straight, prominent, rounded ridge.

The proximal surface of the bone (figure 5) shows principally the sub-triangular saddle-shaped face for articulation with the ulna.

The distal surface of the bone (figure 6) presents, also, a somewhat triangular and saddle-shaped face, for the support of the unciform bone, and, in the specimen figured, an additional, distinct, oval, and convex face, giving support to the metacarpal of the fifth digit.

In other specimens, this face is present, and well developed, but confluent with that supporting the unciform, as shown in the woodcuts below, figures 117 and 118.

The pyramidal bone in a second specimen of *Dinoceras*, and in one of *Tinoceras*, is shown in figures 117 and 118, below.

FIG. 117.

FIG. 118.

FIGURE 117.—Left pyramidal of *Tinoceras ingens*, Marsh (No. 1577); distal end.

FIGURE 118.—Left pyramidal of *Dinoceras mirabile*, Marsh (No. 1230); distal end.

mcV. face for fifth metacarpal; un. face for unciform.

Both figures are one-half natural size.

The following are the more important dimensions of the pyramidal bone in three specimens of *Dinoceras* and *Tinoceras*:

Measurements of Left Pyramidal. (Dinoceras mirabile, No. 1208.)

	m.
Greatest length of longitudinal axis of pyramidal,	.045
Total length of bone,	.098
Least transverse diameter,	.054
Greatest diameter of ulnar articular surface,	.073
Antero-posterior diameter of ulnar articular surface,	.049
Greatest diameter of articular face for unciform,	.064
Antero-posterior diameter of articular face for unciform,	.051
Diameters of face for fifth metacarpal,	.018-.029

Measurements of Left Pyramidal. (Dinoceras mirabile, No. 1230.)

	m.
Greatest length of longitudinal axis of pyramidal,	.042
Greatest diameter of bone,	.100
Least transverse diameter,	.062
Greatest diameter of ulnar articular face,	.083
Antero-posterior diameter of ulnar articular face,	.049
Greatest diameter of face for unciform,	.067
Antero-posterior diameter of face for unciform,	.057
Diameter of face for fifth metacarpal,	.026

Measurements of Left Pyramidal. (Tinoceras ingens, No. 1577.)

	m.
Greatest length of longitudinal axis of pyramidal,	.050
Greatest diameter of bone,	.113
Least transverse diameter,	.069
Greatest diameter of ulnar articular surface,	.092
Antero-posterior diameter of ulnar articular surface,	.062
Greatest diameter of articular face for unciform,	.080
Antero-posterior diameter of articular face for unciform,	.066

THE PISIFORM. (Plate XXXII, figures 7-12.)

The pisiform in the *Dinocerata* is a short, stout bone, presenting, as usual, two confluent articular faces, one for the ulna, and the second for the pyramidal.

Plate XXXII, figure 7, represents the surface of the pisiform seen from the side of the skeleton, when the bone is in its natural position, except that the long axis has been placed in a vertical, instead of an oblique, position. Neither of the articular faces can be seen in this figure.

The inner side of the bone, or that turned toward the pyramidal (figure 8), shows, at its proximal end, a large and somewhat triangular face, flattened, or slightly concave or convex, and extending, in the specimen figured, over more than half the length of the bone, but, in some specimens, it is proportionally shorter.

Figure 9, which gives the view opposite to that in figure 7, shows this articular face, seen obliquely.

The proximal end of the bone (figure 11) is nearly covered by a triangular articular face for union with the ulna. This face, in the specimen figured, is flat in one direction, and distinctly convex in the other, but another specimen of the same bone has this face distinctly convex in both directions.

Distally, the pisiform is strongly roughened and tuberculated, with the end rounded, as shown in figure 12.

The principal measurements of two specimens of the pisiform bone in *Dinoceras mirabile* are given below.

Measurements of Right Pisiform. (Dinoceras mirabile, No. 1211.)

	m.
Length of pisiform bone,	.061
Greatest transverse diameter,	.050
Least transverse diameter,	.030
Greatest diameter of ulnar articular surface,	.038
Least diameter of ulnar articular surface,	.021
Greatest diameter of face for pyramidal,	.047
Least diameter of face for pyramidal,	.029

Measurements of Right Pisiform. (Dinoceras mirabile, No. 1520.)

	m.
Length of pisiform bone,	.065
Greatest transverse diameter,	.045
Least transverse diameter,	.033
Greatest diameter of ulnar articular surface,	.042
Least diameter of ulnar articular surface,	.021
Greatest diameter of face for pyramidal,	.044
Least diameter of face for pyramidal,	.023

THE TRAPEZIUM.

(Plate XXXIII, figures 1-6, and Plate, LIV, figure 1, *tm.*)

The trapezium in the *Dinocerata* is well developed, being considerably larger than the trapezoid. It presents at each end a large articular face, and a third smaller and much less regular one, for articulation with the trapezoid, on the side turned toward that bone.

The outer, or dermal, surface of the bone (Plate XXXIII, figure 1), when viewed in its natural position in the foot, is rough and tuberculated. The posterior view (figure 2), and the anterior view (figure 4), likewise show no articular faces. Figure 3, representing the surface turned toward the trapezoid, presents an irregular, smooth face along the upper margin. This face differs in size and proportions in different specimens, and in life moved upon a corresponding surface on the trapezoid.

The proximal end of the bone (figure 5) is almost entirely covered by the articular face for the scaphoid. This face, nearly semi-circular in outline, is flattened in one direction, slightly concave in the other, and confluent along the straight margin with the face for the trapezoid.

The distal end (figure 6) presents a semi-oval articular face, not extending quite to the anterior part of the bone, and supporting in life the well developed, short, first metacarpal. This articular face is somewhat saddle-shaped, being convex along its short diameter, and slightly concave lengthwise.

The main dimensions of the trapezial bone in two specimens of the *Dinocerata* are given below.

Measurements of Left Trapezium. (Dinoceras mirabile, No. 1208.)

	m.
Length of longitudinal axis of trapezium,	.036
Greatest horizontal diameter,	.062
Least horizontal diameter,	.033
Longest diameter of proximal articular face,	.044
Transverse diameter of proximal articular face,	.026
Longest diameter of distal articular face,	.048
Transverse diameter of distal articular face,	.026

Measurements of Right Trapezium. (Tinoceras ingens, No. 1219.)

	m.
Length of longitudinal axis of trapezium,	.037
Greatest horizontal diameter,	.068
Least horizontal diameter,	.031
Greatest diameter of proximal articular face (approximate),	.045
Transverse diameter of proximal articular face,	.032
Greatest diameter of distal articular face,	.053
Transverse diameter of distal articular face,	.030

THE TRAPEZOID.

(Plate XXXIII, figures 7-12, Plate LIV, figure 1, *tr*;
and woodcuts 119-120, below.)

The trapezoid is a small bone in the *Dinocerata*, being much the smallest of the carpals, with the exception of the pisiform, and perhaps also of the central, if separate. The general shape of the bone is that of a blunt, nearly square, wedge, the large end being presented to the superior, or anterior, surface of the foot.

This end of the bone is represented in Plate XXXIII, figure 7, and shows nearly all that can be seen of it when in its natural position with

the other bones of the foot. The surface is strongly rugose, and, in this view, nothing can be seen of the articular faces.

The lateral surface turned toward the trapezium presents an articular face for union with that bone. An ordinary form of this face is shown in figure 8, but it is of variable form and size. Sometimes it even extends obliquely across the lateral surface of the bone, and becomes more or less widely confluent with the articulation for the metacarpal, along the anterior part of its lateral border, as in woodcut 119 below.

FIG. 119.

FIG. 120.

FIGURE 119.—Left trapezoid of *Dinoceras mirabile*, Marsh (No. 1230); side view.

FIGURE 120.—The same bone; distal end.

mcII. face for second metacarpal; *s.* face for scaphoid; *tm.* face for trapezium.

Both figures are one-half natural size.

The posterior, or palmar, aspect of the bone (figure 9) shows its wedge-like form, but the articular faces visible are seen only obliquely.

The side turned toward the magnum (figure 10) has an articular surface extending across the bone. Usually, this surface is near the anterior part of the bone, and sometimes, as in the specimen figured, is more or less interrupted at the middle by a ridge. This surface may also be broadly continued to the posterior, or palmar, end of the scaphoid articular face, as in number 1505.

The upper ulnar angle of this specimen is rounded for articulation with the lunar. This portion of the bone may represent the central, coalesced with the trapezoid, as in the existing *Dendrohyrax*.

The proximal articular face (figure 11), joining the scaphoid bone, is narrowly oval in outline, broader in front than behind, and more or less concave in both directions.

The distal face is somewhat similar in shape to the proximal, but sometimes shorter and broader, and is slightly convex in one, or both directions.

The principal dimensions of the trapezoid bone in two individuals of *Dinoceras*, and one of *Tinoceras*, are as follows:

Measurements of Left Trapezoid. (Dinoceras mirabile, No. 1208.)

	m.
Greatest vertical extent of trapezoid,.....	.036
Length of vertical axis,.....	.022
Greatest (antero-posterior) diameter,.....	.058
Transverse diameter, near the middle,.....	.029

Transverse diameter of distal articular face,.....	.029

THE MAGNUM.

(Plate XXXIV, figures 1-6, Plate LIV, figure 1;
and woodcuts 121-122, below.)

The magnum in the *Dinocerata* is proportionally a much smaller bone than in the elephant, and has a much greater difference in the length of the vertical axis in the anterior and posterior parts of the bone, than in that animal.

An anterior view of the magnum, when in its natural position among the other bones of the carpus, is seen in Plate XXXIV, figure 1. The dermal surface is pentagonal in outline, rough and tuberculated, while behind and above it, is seen obliquely a portion of the smooth articular face by which the bone articulates with the lunar and scaphoid bones of the preceding carpal series.

The lateral surface of the magnum (figure 2) turned toward the trapezoid varies in the shape and structure of its articular face for that bone. This face is frequently more or less divided, as in the specimen figured, or the articular face may be on the distal part of the bone, not extending across to the scaphoid face. A large proportion of the posterior part of the face for the scaphoid is seen in the same figure. This face is strongly saddle-shaped. In the same view, is seen a third articular face, for the support, in part, of the second metacarpal. This face is narrow, and elongated from before backward, and, in the natural position of the bone, is directed obliquely downward, toward the radial side of the foot.

The posterior, or palmar, surface of the magnum (figure 3) is rough, but rounded over, and shows at the upper, or proximal, end a portion of the articular face for the lunar, carried well over on the posterior face of the bone.

The lateral surface (figure 4) turned toward the unciform presents a considerable, but varying, articular surface for union with that bone. In the specimen figured (number 1208), there is a large area extending along the entire length of the proximal, or lunar, articular face, contracting near the middle, but expanding anteriorly, so as to extend nearly, or quite, across the lateral surface of the bone. In many specimens (numbers 1195, 1218, 1219, 1230, 1516), this area is confluent with the distal articular face for the third metacarpal. In the specimen figured, however, it is, interrupted by a slight ridge at this point, beyond which, it is continued well along the margin of this articular face posteriorly. This distal backward extension of the articular face is not present in all specimens (numbers 1195, 1230), and is often much narrower than in the specimens figured (numbers 1211, 1219).

The proximal surface of the magnum (figure 5), by which it bears upon the scaphoid and lunar bones, is much elevated posteriorly in the region of the face for the lunar, but the two facets are so perfectly confluent as scarcely to be distinguished. The face for the scaphoid is strongly saddle-shaped, and does not extend quite to the anterior margin of the bone.

The face for the lunar is nearly flat, or slightly convex from side to side, sigmoid from before backward, and is carried well over to the posterior face of the bone. The variation in the form of this curve is considerable, but the specimen figured on the Plate may be regarded as a fair average, while extreme forms are represented in woodcuts 121 and 122, below.

FIGURE 121.—Right magnum of *Dinoceras mirabile*, Marsh (No. 1211); side view.

FIGURE 122.—Right magnum of *Dinoceras mirabile*, (No. 1230); side view.

l. face for lunar; *mc III.* face for third metacarpal; *un.* face for unciform.

Both figures are one-half natural size.

The distal face of the magnum (Plate XXXIV, figure 6) is mostly occupied by an elongated articular face for the support, in great part, of the third metacarpal. This face is more or less moderately concave from before backward, slightly convex transversely, and is usually a little broader in front than behind. It is separated by a rounded ridge from the confluent, narrower and oblique, face lying along its radial side, and aiding in the support of the second metacarpal.

The dimensions of the magnum bone of four individuals of the *Dinocerata* are as follows:

Measurements of Left Magnum. (Dinoceras mirabile, No. 1208.)

	m.
Length of longitudinal axes of magnum,.....	.033-.062
Antero-posterior diameter,.....	.066

THE UNCIFORM.

(Plate XXXIV, figures 7-12, Plate LIV, figure 1, *un*;
and woodcuts 123-124, below.)

The unciform in the *Dinocerata* is similar, in general shape and proportions, to that of Proboscidiens, but is less oblique, and presents three sub-equal articular faces on its distal surface, instead of two, as in the elephant.

The exterior, or dermal, surface of the bone (Plate XXXIV, figure 7) is moderately roughened and pitted, and is regularly rounded, in the horizontal direction, through an arc but little short of a quadrant. From above downward, the surface is nearly plane.

The inner surface (figure 8), or that turned toward the magnum, is bordered above, in part, and partly below, by a smooth articular face for union with that bone. The amount and disposition of this surface vary in a manner corresponding with the faces for its union with the magnum, as before described. The proximal and anterior portions of this face are the most constant, and may be confluent along the whole margin of the proximal articular face, or may be interrupted near the middle (number 1195). The proximal part of this face may extend quite across, so as to become confluent with the face for the third metacarpal, and may then, as in the specimen figured, border that face throughout its extent, or it may even fail to reach the lower, or distal, margin of the bone at all (numbers 1509, 1525).

The posterior, or postero-interior, face of the unciform (figure 9) is quite irregular, and, when not encroached upon by articular faces, is moderately roughened.

The outer side of the bone (figure 10) is short from above downward, allowing the articular face for the pyramidal to approach that for the fifth metacarpal, as in the elephant. These faces may even be confluent for a short distance across this surface (number 1211), as in figure 123, below, or may be separated (numbers 1509 and 1525), as in figure 124.

The proximal face (Plate XXXIV, figure 11) is obliquely saddle-shaped, and presents two confluent, but distinguishable, faces, one for the lunar, and one much larger, for the pyramidal.

The face for the lunar lies along the inner, or radial, side of the proximal surface, and is sigmoid from before backwards, and transversely more or less convex. Its posterior half is considerably elevated above the anterior, to fit into a corresponding excavation in the lunar.

The face for articulation with the pyramidal is somewhat in the form of a quadrant, one side being confluent with the face for the lunar, the other side running along the outer, or posterior, margin of the bone, while the curve forms the upper limit of the dermal surface. This face is strongly saddle-shaped, concave antero-posteriorly, and convex from side to side.

The distal surface of the unciform (figure 12) bears three concave articular faces for the support of the third, fourth, and fifth metacarpals. Of these, the inner is the smallest, triangular in outline, only slightly concave, and aids the magnum in the support of the middle, or third, metacarpal.

The second, or median, articular face is the largest, and is more deeply concave than the first. It extends antero-posteriorly quite across the distal end of the bone, but is much broader in front than behind. It supports the fourth metacarpal.

The third articular face, situated upon the outer, or ulnar, side of the distal end of the unciform, is more strongly concave antero-posteriorly than either of the others, and is nearly as broad behind, or on its palmar margin, as in front. It is oblique to the axis of the bone, and, as already mentioned, may even be confluent for a short distance with the proximal face for the pyramidal, as shown in figure 123, below.

The unciform bone in two individuals of the *Dinocerata* is represented in the woodcuts below. The specimens figured show marked differences, but whether these are constant in all the species of the two genera cannot at present be determined. This is the case, also, with other carpal bones.

FIGURE 123.—Right unciform of *Dinoceras mirabile*, Marsh (No. 1211); side view.FIGURE 124.—Right unciform of *Tinoceras ingens*, Marsh (No. 1509); side view.*mcV.* face for fifth metacarpal; *p.* face for pyramidal.

Both figures are one-half natural size.

Four specimens of the unciform bone from different individuals of *Dinocerata* have the following dimensions:

Measurements of Left Unciform. (Dinoceras mirabile, No. 1208.)

	m.
Length of longitudinal axes of unciform,-----	.041-.068
Antero-posterior diameter,-----	.068

THE METACARPAL BONES.

(Plates XXXV, XXXVI, XXXVII, and Plate LIV, figure 1.)

The metacarpal bones in the *Dinocerata* are short and robust. They are five in number, and each represents a well developed digit. Their general form and position in the foot of *Dinoceras mirabile* are shown in Plate LIV, figure 1, and also in the restoration of this species, Plate LV.

THE FIRST METACARPAL. (Plate XXXV, figures 1-6.)

The metacarpal bone of the first, or inner, digit, the pollex, is a robust, and usually short bone, proportionally much stronger than in the elephant. In all the specimens preserved, the epiphyses, whether present on one end only, or on both ends, as in the elephant, are firmly coössified with the shaft of the bone. The surface of the bone, as shown in Plate XXXV, figures 1-4, is rough and very irregular.

The proximal articular face (figure 5) is nearly elliptical in outline, and is flattened, but elevated, near the middle of the palmar side of the margin. On some specimens, there is a distinct oval face for contact with the second metacarpal. This face is raised upon a large tubercular elevation, and may, or may not, be in contact with the proximal articular face.

The distal end (figure 6) presents a flattened, and somewhat concave, face for the phalangeal bone, and two broad, oblique grooves for the sesamoids.

Three first metacarpals of *Dinoceras* have their principal dimensions as follows:

<i>Measurements of First Metacarpal. (Dinoceras mirabile, No. 1208.)</i>	
	m.
Total length of first metacarpal,	.063
Diameters of proximal articular face (approximate),	.025-.044
Diameters of face for phalanx,	.027-.034

<i>Measurements of First Metacarpal. (Dinoceras mirabile, No. 1211.)</i>	
	m.
Total length of first metacarpal,	.098
Diameters of proximal articular face (approximate),	.030-.050
Diameters of face for phalanx,	.037-.043
Diameters of face for second metacarpal,	.020-.022

<i>Measurements of First Metacarpal. (Dinoceras, No. 1526.)</i>	
	m.
Total length of first metacarpal,	.056
Diameters of proximal articular face (approximate),	.026-.044
Diameter of face for phalanx,	.030

THE SECOND METACARPAL. (Plate XXXV, figures 7-12.)

The metacarpal supporting the second digit in the *Dinocerata* is nearly twice as long as the first, but not greatly wider, nor thicker. The shaft is strongly roughened and tuberculated near each end, as shown in Plate XXXV, figures 7-10, while the middle portion is much smoother.

The proximal end of the bone presents three distinct, but confluent, articular faces, of which the first, beginning on the radial side, is the largest. It met the trapezoid, and furnished the principal support of that bone. This face, shown in figure 11, is oblique to the axis of the bone, throwing it, in its natural position, well toward the radial side of the manus. It is a little broader, and more oblique, above than below, and is slightly concave in both directions.

A second adjoining face, shorter and smaller, shown also in figure 11, is nearly perpendicular to the axis of the bone, slightly narrowed behind, and convex in both directions. In life, this face articulated with the oblique distal face of the magnum.

A third face, on the ulnar side of the bone at the proximal end, shown best in figure 10, articulated with a similar face on the adjoining third metacarpal.

The distal end of the bone (figure 12) bears a broadly oval, only slightly convex, articular face for the phalanx. This is encroached upon below, by the broad, shallow grooves for sesamoid bones.

The principal dimensions of the second metacarpal represented in Plate XXXV are as follows:

<i>Measurements of Second Metacarpal. (Dinoceras mirabile, No. 1208.)</i>		m.
Total length of second metacarpal,		.102
Diameters of proximal end,		.039-.065
Diameters of distal end,		.046-.058
Diameters of shaft,		.030-.040
Antero-posterior diameter of face for trapezoid,		.050
Transverse diameters of face for trapezoid,		.020-.023
Antero-posterior diameter of face for magnum,		.046
Transverse diameters of face for magnum,		.012-.018
Antero-posterior diameter of face for third metacarpal,		.040
Diameters of face for phalanx,		.025-.041

THE THIRD METACARPAL. (Plate XXXVI, figures 1-6.)

The third metacarpal resembles the second in general size and shape, but may be readily distinguished from it by the presence, on the proximal end, of four, instead of three, articular faces. Like that bone, it is rough and tuberculated, especially near the ends. It bears, also, a rugose surface not far above the middle of its shaft on the ulnar side, best shown in Plate XXXVI, figures 1 and 3.

Of the four proximal articular faces, the first, beginning on the radial side is almost entirely on the lateral surface of the bone, as represented in figure 2. In life, it moved upon a corresponding face on the adjoining second metacarpal. It is confluent, along its proximal margin, with the second articular face, which is the largest of the four, and articulated with the principal distal face of the magnum.

This face, shown in figures 2 and 5, extends with parallel sides across the proximal end of the bone, from before backward. It is concave from side to side, though slightly convex antero-posteriorly, and formed, during life, the principal support of the bone. Its plane is more inclined to the axis of the bone than is that of the third face, which, in life, rested on the unciform.

The third face, best shown in figure 5, is large and triangular, the apex of the triangle being turned posteriorly, or toward the palmar surface of the manus. This face articulated with the unciform. It is convex in both directions, and, being more nearly perpendicular to the axis of the metacarpal than is the face for the magnum, must have contributed, during life, nearly as much to its support.

The face for the unciform is confluent along its entire outer, or ulnar, margin with a fourth, broad articular face on the side of the bone (figure 4), which, in life, met a corresponding face on the fourth metacarpal.

The distal end of the bone (figure 6) supports a moderately convex face for the phalangeal articulation, placed well upon the upper surface of the bone, and scarcely extending as low as the middle of the distal end. Here, it is met by the broad and shallow grooves, in which a pair of

sesamoid bones moved during life. The ridge between these grooves is nearly obsolete in front, but well developed posteriorly.

The more important measurements of two third metacarpals of *Dinoceras* are given below.

Measurements of Third Metacarpal. (Dinoceras mirabile, No. 1208.)

	m.
Total length of third metacarpal,.....	.114
Diameters of proximal end,.....	.052-.062
Diameters of distal end,.....	.044-.054
Diameters of shaft,.....	.031-.042
Antero-posterior diameter of face for second metacarpal,	.040
Transverse diameter of face for second metacarpal,	.015
Antero-posterior diameter of face for magnum,.....	.056
Transverse diameter of face for magnum,.....	.022
Antero-posterior diameter of face for unciform,.....	.050
Transverse diameter of face for unciform,	.030
Antero-posterior diameter of face for fourth metacarpal,	.050
Transverse diameter of face for fourth metacarpal,	.025
Diameters of face for phalanx,.....	.025-.042

Measurements of Third Metacarpal. (Dinoceras mirabile, No. 1529.)

	m.
Diameters of proximal end of third metacarpal,.....	.044-.073
Diameters of shaft,.....	.032-.040
Antero-posterior diameter of face for second metacarpal,.....	.043
Transverse diameter of face for second metacarpal,	.014
Antero-posterior diameter of face for magnum,	.069
Transverse diameter of face for magnum,.....	.025
Antero-posterior diameter of face for unciform (approximate),.....	.055
Transverse diameter of face for unciform,	.030
Antero-posterior diameter of face for fourth metacarpal,	.059
Transverse diameter of face for fourth metacarpal,.....	.015-.018

THE FOURTH METACARPAL.

(Plate XXXVI, figures 7-9, and Plate XXXVII, figures 1-3.)

The fourth metacarpal in the *Dinocerata* is a robust bone, like the second and third of the series. It may be easily distinguished by the broad, sub-triangular, convex articular face, at right angles with the axis of the bone, and covering its entire proximal end.

The surface of the bone is roughened towards the ends, but smoother along the shaft, as shown in Plate XXXVI, figures 7 and 8, and Plate XXXVII, figures 1 and 2. It is considerably extended antero-posteriorly near the proximal end, but is constricted at the middle.

The proximal end (Plate XXXVII, figure 3) is almost completely covered by the articular face for the unciform bone, by which the fourth metacarpal was entirely supported. This face is convex in both directions, and broad in front. It becomes much narrower behind, or toward the palmar side of the manus, so as to appear triangular, but does not come quite to a point. Along each side, it is confluent with narrow faces, nearly at right angles with the main surface, which joined, during life, corresponding faces on the third and fifth metacarpals.

The largest of these lateral faces, shown in Plate XXXVI, figure 8, extends along the entire margin of the unciform face on its radial side, and was adapted to the third metacarpal.

On the opposite, or ulnar, side (Plate XXXVII, figure 2), a smaller and shorter face, sometimes, as in the specimen figured, much larger anteriorly, was adapted, during life, to the fifth metacarpal.

The distal end of the bone (Plate XXXVI, figure 9) presents a rounded, and but slightly convex, face for the phalanx, and below are shallow grooves for the two sesamoid bones.

Measurements of the fourth metacarpal bone in four specimens of the *Dinocerata* are as follows:

<i>Measurements of Fourth Metacarpal. (Dinoceras mirabile, No. 1211.)</i>		m.
Total length of fourth metacarpal,-----		.131
Diameters of proximal end,-----		.050-.081
Diameters of distal end,-----		.052-.044
Diameters of shaft (approximate),-----		.038-.041
Antero-posterior diameter of face for unciform,-----		.076
Transverse diameters of face for unciform,-----		.022-.048
Antero-posterior diameter of face for third metacarpal,-----		.062
Transverse diameters of face for third metacarpal,-----		.013-.022
Antero-posterior diameter of face for fifth metacarpal,-----		.052

Diameters of articular face for phalanx,.....	.030-.042

THE FIFTH METACARPAL. (Plate XXXVII, figures 4-9.)

The specimens of the fifth metacarpal in the Yale Museum are, unfortunately, all more or less distorted by pressure, and hence fail to fully represent this element of the manus. The bone is well developed, scarcely smaller than the third and fourth, and considerably surpasses the first in length. Like the other bones of the metacarpal series, it is rough and tubercular, especially toward the ends.

The proximal end (Plate XXXVII, figure 8) presents three articular faces, of which the main and middle one, for the support of the bone upon the unciform, is strongly convex. The convexity is carried through a considerable arc in the antero-posterior direction, to correspond with the outer, and most concave facet, on the unciform bone, to which it is adapted. This surface is bordered, on the inner, or radial side, by a face, broadest anteriorly, for motion on the fourth metacarpal. Behind, and on the outer, or ulnar, side of the principal articular face, is a much smaller face, which, in life, moved upon a corresponding articulation on the distal end of the pyramidal.

In some specimens, the shape of the unciform, as shown on page 119, figure 124, would seem to make this impossible, and doubtless this face will not be found to be constantly present on the fifth metacarpal.

The distal end of the bone (Plate XXXVII, figure 9) presents, as usual, a round, or oval, face for articulation with the phalanx, and shallow grooves below for a pair of sesamoids.

The specimens preserved are so much distorted that measurements would be of comparatively little value.

THE PHALANGES. (Plate XXXVIII, and Plate LIV, figure 1.)

The phalanges in the fore foot of the *Dinocerata* are very short, and comparatively small. Their general characters are shown in the Plates cited above, as well as in the restorations given in Plates LV and LVI.

The proximal phalanges (Plate XXXVIII, figures 1 and 2) are much the largest. The proximal surface has no central groove, and is adapted to the comparatively smooth face on the distal end of the metacarpals.

The median phalanges (figures 3 and 4) are much shorter than those described above. Their proximal articular faces are nearly flat, and the distal ones, smaller, and more concave transversely.

The ungual phalanges (figures 5 and 6) are larger than those of the median series, and, with the exception of the small articular face, their surfaces are very rugose.

CHAPTER IX.

THE RIBS AND STERNUM.

(Plates XXXIX, XL, LV, and LVI.)

The ribs in the *Dinocerata* present no special characters of importance. Their general features are well shown in the illustrations above cited, especially in the restorations at the end of the volume.

THE FIRST RIB.

(Plate XXXIX, figures 1-3.)

The first rib in the *Dinocerata* has a general resemblance to the corresponding bone in the mastodon. It is, however, proportionally shorter, and more flattened at the sternal end.

This rib presents a well rounded articular face to the first dorsal vertebra, and, confluent with this, on the anterior side of the head, is another strongly convex face, for articulation with a well developed facet near the posterior margin of the last cervical vertebra.

The tubercular articulation is but little elevated above the capitular. It is convex from before backward, concave from side to side, and looks almost perpendicularly upward, being directed but very slightly backward. The tubercle of the rib extends outward beyond the articular face.

The shaft is moderately roughened, more especially on its anterior, or outer, surface. The sternal face is so strongly flattened and expanded that the external border of the rib shows only a very moderate degree of curvature. The inner border, however, is strongly curved, mostly in the upper half of the bone.

THE ANTERIOR DORSAL RIBS. (Woodcuts 125-132, below.)

The second rib in one species of *Uintatherium* is represented in the figures below.

FIGURE 125.—Second rib of *Uintatherium latifrons*, Marsh (No. 1231); posterior view.

FIGURE 126.—The same rib; front view.

FIGURE 127.—The same rib; inner view.

FIGURE 128.—The same rib; proximal end.

h. head; *t.* tubercle.

All the figures are one-fourth natural size.

The second rib is much longer, and less robust, than the first, above described. The head is large, and the two articular faces on it are confluent. The tubercle is well developed, and at nearly the same level as the head. The shaft is only moderately curved, and considerably compressed. The distal end is flattened, and wider than the shaft.

The ribs behind the second gradually increase in length, and become more curved. The head remains large, and its articular faces are usually separated from each other, as shown in figures 129–132, below.

FIGURE 129.—Anterior rib of *Dinoceras mirabile*, Marsh (No. 1212); posterior view.

FIGURE 130.—The same rib; inner view.

FIGURE 131.—The same rib; front view.

FIGURE 132.—The same rib; proximal end.

h. head; *t.* tubercle.

All the figures are one-fourth natural size.

The main dimensions of the first rib in one individual of *Dinoceras mirabile* are as follows:

Measurements of First Rib. (Dinoceras mirabile, No. 1251.)

	m.
Total length of rib,	.320
Greatest diameter of head,	.038
Transverse diameter of head,	.032
Diameters of tubercular articulation,	.020-.030
Diameters of shaft, near the middle,	.021-.040
Diameters of shaft, at sternal end,	.027-.095

The principal measurements of the second rib of *Uintatherium* are given below.

Measurements of Second Rib. (Uintatherium latifrons, No. 1231.)

	m.
Total length of rib, in straight line,	.440
Greatest diameter of head,	.055
Transverse diameter of head,	.030
Diameter of tubercular articular face,	.024
Diameters of shaft, near the middle,	.020-.039
Diameters of shaft, at lower end (approximate),	.025-.060

The dimensions of two dorsal ribs of *Dinoceras* are as follows:

Measurements of Anterior Rib. (Dinoceras mirabile, No. 1212.)

	m.
Total length of rib, in straight line,	.500
Greatest diameter of head,	.048
Transverse diameter of head,	.036
Diameter of tubercular articular face (approximate),	.023
Diameters of shaft, near the middle,	.022-.060
Diameters of shaft, at lower end (approximate),	.025-.038

Measurements of Median Rib. (Dinoceras mirabile, No. 1210.)

	m.
Total length of rib, in a straight line,	.605
Diameters of head,	.047-.058-.065
Diameters of neck,	.034-.039
Diameters of shaft,	.017-.057

THE POSTERIOR RIBS. (Plate XXXIX, figures 4-9.)

The posterior ribs gradually diminish in length, and become more slender, but the curvature is still strongly marked. In most of them, the head is large, and the two articular faces on it, distinct. The tubercle diminishes in size, and toward the last is a mere sessile articular face.

The sternal ribs are not preserved in any of the known specimens of the *Dinocerata*, and they were probably unossified. Their general form and position are indicated in the restorations, Plates LV and LVI.

The more important dimensions of two posterior ribs in the type of *Dinoceras mirabile* are the following :

Measurements of Dorsal Rib. (Dinoceras mirabile, No. 1036.)

	m.
Total length of rib, in straight line,	.530
Greatest diameter of head,	.052
Transverse diameter of head,	.037
Least diameter of shaft, near the middle,	.015
Diameters of shaft, at broadest point,	.025-.060

Measurements of Posterior Rib. (Dinoceras mirabile, No. 1036.)

	m.
Total length of rib, in straight line,	.520
Greatest diameter of head,	.056
Transverse diameter of head,	.062
Diameters of shaft, at broadest point,	.016-.051

THE STERNUM.

(Plate XL; and woodcut 133, below.)

Sternal bones are preserved in a number of individuals of the *Dinocerata* in the Yale Museum, but the entire series in any one individual has not been recovered. The general form and character of these bones are shown in the figures, Plate XL. A series in the natural position is represented in the woodcut below.

The most marked character of these bones in the *Dinocerata* is that they are flat and horizontal, as in the Artiodactyls, and not vertical, as in the Proboscidiens, and the Perissodactyls. The first bone of the series, or the pre-sternum, is compressed, pointed in front, and, at this end, has two distinct facets for the first pair of ribs. This bone is shown in Plate XL, figures 1, 2, and 3.

The bones which follow, and compose the meso-sternum, are broad and flat, somewhat constricted near the middle, with the ends more or less convex. The anterior ends are usually strongly convex, while the posterior extremities may be nearly flat.

Two examples of these median sternal bones are shown in the same Plate, figures 4-9, as well as in the woodcut below.

FIG. 133.

FIGURE 133.—Sternum of *Dinoceras mirabile*, Marsh; top view.
One-fifth natural size.

The last sternal bone of the series, or the xiphi-sternum, is also broad and flat, but has the posterior extremity pointed. This bone is shown in figures 10-12, of the same Plate.

The surface of all the sternal bones is quite rugose, and the extremities are deeply pitted for union with the cartilage that held them in position.

No indication of clavicles has been observed.

CHAPTER X.

THE PELVIC ARCH AND TAIL. (Plates XLI, XLII, XLIII, LV, and LVI.)

THE PELVIS.

(Plates XLI-XLII; and woodcuts 134-135, below.)

In all the known specimens of the *Dinocerata* in which the pelvic arch is preserved, the ilium, ischium, and pubis are firmly coösfied with each other, but not with the sacrum. The three pelvic bones on each side unite with each other earlier, and much more closely, than they do with the sacrum above, or with the opposite pelvic bones below. The sutures for the latter union remained open until the animal was fully adult, and, even then in some specimens, were readily separated. These features are well shown in Plate XLI.

The pelvis of *Dinoceras* may be compared with that of the elephant, to which it bears a considerable resemblance, but from which it differs in many important particulars.

The ilia are much expanded, and nearly quadrant-shaped in outline, the supra-iliac border being very regularly curved, and only moderately thickened near its union with the acetabular border, which it joins at about a right angle. The iliac surface is moderately concave in both directions, especially near the surface for union with the sacrum.

The gluteal surface is nearly flat where most expanded, but becomes convex in the acetabular region. It rises but little above the sacral articular surface, which is short, somewhat triangular in outline, and

presents a strong union with the transverse processes of the first two sacral vertebræ.

The ilia are more rounded in outline, and the pubes are less firmly united at the symphysis, than in the mastodon. The ischia, also, do not unite at all, as in that animal, but are rounded off, and distant from each other.

FIG. 134.

FIGURE 134.—Pelvis of *Tinoceras ingens*, Marsh (No. 1497); seen from below.

FIG. 135.

FIGURE 135.—The same; front view

a. acetabulum; *f.* thyroid foramen; *il.* ilium; *is.* ischium; *p.* pubis; *s.* anterior end of sacrum; *s'.* posterior end of sacrum.

Both figures are one-eighth natural size.

The pelvic arch in *Tinoceras* is similar, in its general features, to that of *Dinoceras*, but presents various differences which are apparent in comparing the figures 134 and 135, above, with the corresponding views of the type specimen of *Dinoceras mirabile* represented in Plate XLI.

The sacrum in *Dinoceras* differs from that of *Mastodon Americanus* in having four sacral vertebræ instead of five, and much larger transverse processes, for articulation with the ilia. The foramina between these processes are also proportionally much larger. Only the first two of the processes unite strongly with the ilium, instead of four, as in the mastodon. Both the sacrum, and the face for attachment to the ilium, are proportionally much shorter than in the mastodon.

The more important dimensions of the pelvic arch in the type specimen of *Dinoceras mirabile*, and in one individual of *Tinoceras ingens*, are the following:

Measurements of Pelvis. (Dinoceras mirabile, No. 1036.)

	m.
Greatest transverse diameter, across ilia,	1.120
Horizontal diameter of pelvic opening (approximate),	.350
Vertical diameter of pelvic opening (approximate),	.250
Diameter across acetabula,	.660
Diameters of acetabulum,	.110-.125
Diameters of thyroid foramen,	.075-.150
Length of symphysis pubis,	.140
Length of four sacral vertebræ (approximate),	.245
Extent of transverse processes of first sacral,	.330
Horizontal diameter of anterior face of first sacral,	.110
Vertical diameter of anterior face of first sacral,	.075
Length of first sacral centrum,	.075

Measurements of Pelvis. (Tinoceras ingens, No. 1497.)

	m.
Greatest transverse diameter, across ilia,	1.180
Horizontal diameter of pelvic opening (approximate),	.400
Vertical diameter of pelvic opening (approximate),	.300
Diameter across acetabula,	.700
Diameters of thyroid foramen,	.060-.150
Length of symphysis pubis,	.140
Length of four sacral vertebræ,	.295
Extent of transverse processes of first sacral,	.355
Horizontal diameter of anterior face of first sacral,	.117

Vertical diameter of anterior face of first sacral,	m. .072
Length of centrum of first sacral,	.085
Length of centrum of second sacral,	.075
Length of centrum of third sacral,	.065
Length of centrum of fourth sacral,	.067

THE CAUDAL VERTEBRÆ.

(Plate XLIII; and woodcut 136, below.)

The anterior caudal vertebræ of the *Dinocerata* have the centra short and flat, with long and depressed transverse processes. The neural spine is only moderately developed. The neural arch is low, and situated on the anterior two-thirds of the centra. The zygapophyses are weak, and their articular faces usually curved.

In the median caudals, the transverse processes become shorter, and gradually disappear.

The distal caudals are cylindrical, and of moderate length. They are without zygapophyses, or neural arches, as seen in figure 136, below.

FIG. 136.

FIGURE 136.—Caudal vertebra of *Dinoceras laticeps*, Marsh (No. 1039).

a. proximal end; b. side view; c. distal end.

All the figures are one-half natural size.

The under surface of the caudal vertebræ is rugose, and there are no chevron bones.

CHAPTER XI.

THE HIND LIMBS.

(Plates XLIV, XLV, XLVI, LV, and LVI.)

The hind limbs of the *Dinocerata* have a general resemblance to those of Proboscidiens, but the bones composing them are comparatively shorter, and more robust. When the animal was standing at rest, the posterior limb formed a strong and nearly vertical column. The contrast in this respect between the hind and the fore limb has already been stated, in the description of the latter in Chapter VII.

THE FEMUR. (Plate XLIV; and woodcuts 137-138, below.)

The femur in the *Dinocerata* is proportionally shorter than in the elephant. It is much smoother throughout than the humerus, and is also somewhat longer than that bone.

The head of the femur is hemispherical, and its axis makes an angle of about fifteen degrees with the axis of the shaft of the bone. The diameter of the head is contained about five and one-half times in the length of the femur. There is no indication of any pit for the round

ligament, as is seen in Plate XLIV, figure 3 *a*. The great trochanter scarcely rises above the base of the head. It is flattened, and posteriorly is excavated below.

The upper end of the shaft is broad, flattened in a fore and aft direction, and is excavated behind, especially below the great trochanter. It contracts in transverse diameter gradually to a minimum, near the middle of the shaft, and just below the trochanter minor, where it is flattened behind, but strongly rounded in front. Below this point, it becomes flat behind, and, lower still, is excavated, while the anterior surface is rounded throughout. The anterior and posterior surfaces of the bone, along the inner side, pass into each other by gradual curvature, except in the region of the trochanter minor. The latter process is less than one-third of the way down the shaft, and somewhat stronger than in the elephant. There is no third trochanter.

The curved front surface of the femur is separated from the flattened posterior face by a rounded ridge, extending along the outer and posterior sides nearly the entire length of the shaft. This ridge sharply separates the two faces, but nowhere rises conspicuously above the general surface of the bone, and disappears near the proximal end. Near the distal end, the surface is roughened, but is destitute of the conspicuous fossa above the outer condyle, seen in the horse and the hippopotamus.

The condyles resemble those of the elephant, and, as in that animal, are so placed upon the end of the shaft as to permit the knee-joint to be straightened when standing at rest, and in walking. The characteristic elephantine gait must, therefore, have been assumed by the *Dinocerata*.

The inner condyle is a little greater than the outer in transverse diameter, but much less in antero-posterior dimensions. The two are separated from each other by a deep narrow sulcus, but both are completely confluent above with the shallow and short groove for the patella. This groove is broadly rounded from side to side, and less distinctly pulley-shaped, than in the elephant. It is near the middle of the anterior surface of the bone, and does not rise above the general surface, except to a very small extent along its lateral margins, which are acute, and sub-equal in height.

There is no medullary cavity in the femur, the inner texture of the shaft being merely somewhat cancellated, as shown in the woodcuts below.

FIG. 137.

FIG. 138.

FIGURE 137.—Section of femur of *Dinoceras mirabile*, Marsh (No. 1206).

FIGURE 138.—Section of same bone (No. 1210).

Both figures are one-fourth natural size.

The main dimensions of the femur in one specimen of *Dinoceras* are given below.

Measurements of Right Femur. (Dinoceras mirabile, No. 1206.)

	m.
Length of femur,	.690
Diameters of head,	.123-.126
Distance from summit of head to trochanter minor,	.200
Height of trochanter minor,	.015
Transverse diameter through great trochanter,	.215
Least diameters of shaft,	.067-.093
Transverse diameter of distal end,	.170
Greatest antero-posterior diameter of distal end,	.160
Least antero-posterior diameter of distal end,	.100
Transverse diameter of inner condyle,	.065
Transverse diameter of outer condyle,	.070

THE TIBIA. (Plate XLV.)

The tibia in the *Dinocerata* is much shorter than the femur, as in the elephant and the mastodon, and considerably resembles the same bone in these animals. It differs noticeably in the greater prominence of the tuberosity for the attachment of the patellar ligament.

The proximal articular surfaces for the condyles of the femur are confluent, or very nearly so, being separated by only a low, smooth and rounded ridge, as seen in Plate XLV, figure 3 *a*. The inner face is larger in antero-posterior diameter than the outer, and is concave

throughout in both directions, except for a very small area near its posterior margin. The outer face is shorter, but much broader than the inner, and posteriorly is much more convex, and thus adapted, in extreme flexion of the leg, to a concave face on the outer condyle of the femur. These faces may indicate the presence of a flabella.

Below the outer and posterior part of this articular surface, is a small flattened facet, looking nearly downward, and somewhat outward and backward, for articulation with the fibula.

The upper end of the shaft presents in front a deep rounded excavation, bounded at the sides and below by a roughened curved ridge for muscular attachment. The shaft is contracted in the middle, but expands below, and has its distal end nearly covered by the broad surface for articulation with the astragalus.

This articular face is confluent along its outer margin with a small oblique face for the distal end of the fibula. It is concave antero-posteriorly, but, in transverse section across the middle, is at first slightly convex on the internal malleolus, then concave, and again moderately convex to the margin of the fibular articulation. This face is represented in Plate XLV, figure 1 *a*.

The tibia is nearly, or quite, solid, as shown in figure 5 of the same Plate.

Measurements of Tibia. (Dinoceras mirabile, No. 1208.)

	m.
Total length of tibia,	.390
Greatest diameter, proximal end,	.140
Antero-posterior diameter, below patella,	.096
Antero-posterior diameter of inner proximal articular surface,	.080
Transverse diameter of inner proximal articular surface,	.062
Antero-posterior diameter of outer proximal articular surface,	.070
Transverse diameter of outer proximal articular surface,	.075
Greatest diameter of fibular articular surface,	.033
Least diameter of fibular articular surface,	.027
Least diameters of shaft,	.052-.057
Greatest diameter, distal end,	.107
Antero-posterior diameter, distal end,	.093
Greatest diameter of astragalar surface (approximate),	.095
Antero-posterior diameters of astragalar surface,	.067-.080
Antero-posterior diameter of distal fibular surface,	.035
Least diameter of distal fibular surface,	.015

THE FIBULA. (Plate XLVI, figures 1-4.)

The fibula is slender, and entire, with articular faces well marked at each extremity. The proximal end is somewhat expanded, and has the articular face for union with the tibia oblique, and sub-oval in outline. The shaft is somewhat twisted, and sub-triangular in transverse section. The distal end of the fibula is larger than that above, and quite rugose. The articulation for union with the astragalus is large, and placed obliquely, as shown in Plate XLVI, figure 4.

In some specimens of the *Dinocerata*, and probably in all, the fibula met the calcaneum, as in *Coryphodon*, and the Artiodactyls.

Measurements of the fibula in two individuals of *Dinoceras* are as follows:

Measurements of Fibula. (Dinoceras mirabile, No. 1208.)

Length of fibula (approximate),	m. .350
Diameters of proximal end,	.040-.045
Diameters of proximal articular surface,	.028-.033

Measurements of Fibula. (Dinoceras mirabile, No. 1210.)

Diameters of shaft,	m. .028-.020
Diameters of distal end,	.040-.070
Diameters of distal articular surface (approximate),	.050-.045

THE PATELLA. (Plate XLVI, figures 5-8.)

The patella in the *Dinocerata* is a large bone, and resembles, in its general features, that of the elephant. Its external surface is quite rugose. The articular surface for union with the condyles of the femur is sub-oval in outline, concave from above downward, and transversely convex in consequence of the usual median swelling. The general characteristics are well represented in Plate XLVI, and its position in the skeleton is shown in the restorations at the end of the volume, Plates LV and LVI.

The Pressure of the Blood

The blood is under a constant pressure, and it is this pressure which causes it to flow. The pressure is not the same in all parts of the body, but it is highest in the arteries and lowest in the veins. The pressure in the arteries is about 120 mm. Hg. at the heart and falls to about 80 mm. Hg. at the end of the arteries. The pressure in the veins is about 10 mm. Hg. at the heart and falls to about 5 mm. Hg. at the end of the veins. The pressure in the capillaries is about 35 mm. Hg. at the heart and falls to about 15 mm. Hg. at the end of the capillaries. The pressure in the lymphatics is about 10 mm. Hg. at the heart and falls to about 5 mm. Hg. at the end of the lymphatics.

The Velocity of the Blood

The velocity of the blood flow is not the same in all parts of the body. It is highest in the arteries and lowest in the veins. The velocity in the arteries is about 10 cm. per second at the heart and falls to about 5 cm. per second at the end of the arteries. The velocity in the veins is about 5 cm. per second at the heart and falls to about 2 cm. per second at the end of the veins. The velocity in the capillaries is about 0.1 cm. per second at the heart and falls to about 0.05 cm. per second at the end of the capillaries. The velocity in the lymphatics is about 0.5 cm. per second at the heart and falls to about 0.2 cm. per second at the end of the lymphatics.

The Resistance of the Blood

The resistance of the blood flow is not the same in all parts of the body. It is highest in the arteries and lowest in the veins. The resistance in the arteries is about 100 mm. Hg. at the heart and falls to about 50 mm. Hg. at the end of the arteries. The resistance in the veins is about 50 mm. Hg. at the heart and falls to about 25 mm. Hg. at the end of the veins. The resistance in the capillaries is about 25 mm. Hg. at the heart and falls to about 15 mm. Hg. at the end of the capillaries. The resistance in the lymphatics is about 15 mm. Hg. at the heart and falls to about 10 mm. Hg. at the end of the lymphatics.

CHAPTER XII.

THE HIND LIMBS. (Continued.)

(Plates XLVII-LVI.)

THE hind feet in the *Dinocerata* were considerably smaller than those in front. Their component parts are short and robust, forming together a strong support for the massive hind limbs. There were five digits, as in the Proboscidiens, and the axis of the foot was through the third, or middle, digit.

The general appearance of the hind foot in *Dinoceras mirabile* is represented in Plate LIV, figure 2. The fore foot, or manus, is seen in figure 1 of the same Plate, and both feet are shown in different positions in the restorations, Plates LV and LVI.

THE TARSAL BONES.

(Plates XLVII-L, Plate LIV, figure 2; and woodcuts
139-146, below.)

There are seven well developed tarsal bones in the *Dinocerata*, and their relative position in the hind foot is seen in Plate LIV. These bones are described in detail below. An eighth tarsal bone, the tibiale, appears to have been present.

THE ASTRAGALUS.

(Plate XLVII, Plate LIV, figure 2, *a*; and woodcuts 139-142, below.)

The astragalus in the *Dinocerata* considerably resembles that of the elephant, the bone being, as in that animal, very short, along the axis of the leg and foot. The articular faces are, moreover, but little curved, indicating comparatively slight freedom of motion in the ankle joint.

The superior, or proximal, face of the bone, articulating with the tibia, is shown in Plate XLVII, figure 1. This surface is sub-quadrate in general outline, with rounded angles, but is prolonged posteriorly on the inner, or tibial, side into a large convex lobe.

The surface of the tibial articulation is moderately convex from before backward, and, in front, nearly flat from side to side, but, posteriorly, it becomes somewhat excavated, this being the only indication of the conspicuous groove common in Ungulates. The tibial articular surface is confluent, along the posterior part of its outer margin, with a somewhat convex, rounded face for the fibula, as shown in figure 4.

The inner surface of the bone (figure 2), or that which is presented upon the tibial side of the foot, is excavated by a large, rounded depression, encroaching above upon the margin of the tibial articular face.

Below this depression, the bone is expanded, and presents a rounded and convex articular surface, in close relation with the adjoining, and nearly or quite confluent, face for articulation with the navicular, as shown in figure 140, *t'* below. This convex facet apparently supported a separate bone, as in the existing *Hyrax* (figure 155, Chapter XIV). This bone, as Baur has suggested, probably represents the tibiale, or inner tarsal of the proximal row. The same bone exists also in *Hystrix*, and many other Rodents, and is regarded by Flower as a sesamoid.

The inferior surface of the astragalus (Plate XLVII, figure 3) articulated with three bones; below, with the upper faces of the calcaneum, and, in front, with the navicular and the cuboid. All these articular faces may be confluent, as in the specimen figured on the Plate, and the mode of union with the calcaneum is subject to considerable variation.

In the specimen there figured, the face for the calcaneum may be briefly described as in the form of a horse-shoe with the lateral branches so broad as to leave only a narrow interval between them.

The lateral portions, or branches, present two oval, concave faces, and they are united behind by a broad band, running around the posterior end of a deep, narrow groove, dividing the anterior parts of the articulation, and leading backward to a foramen through the bone. In the specimen figured, this foramen is small and oblique, and no opening is seen through the bone. Along the outer, or fibular, margin of the bone, the articular face is confluent for a short distance with that for the fibula on the side of the astragalus. Near the center of the inferior surface, the inner ramus of the calcaneal articular facet is confluent at the end with the face for the cuboid.

Another, and more common, form of articulation with the calcaneum is shown in figure 140, below, where the lower surface of the astragalus presents two distinct faces for the calcaneum. The outer of these is broad and rounded, nearly flat transversely, concave from before backward, and separated by a deep groove from the inner, more elongated surface. This groove leads backward into a large foramen, passing through the posterior part of the bone. The inner portion of the calcaneal face is longer than the outer, and more concave from before backward. From side to side, it is nearly flat, and, in front, it is more or less confluent with the face for the cuboid, and often also with that for the navicular. In a few specimens, the usual foramen near the hinder border of the bone is represented by a notch only, as in figures 141 and 142, below.

The anterior part of the under surface of the astragalus presents two flattened, moderately convex, and very unequal, articular faces. The larger one of these is for articulation with the navicular, and the smaller, for the cuboid bone.

The presence of a face for the cuboid is in strong contrast with the structure of the foot of the elephant, in which the cuboid is supported by the calcaneum, and the navicular which covers the whole anterior face of the astragalus, not allowing the cuboid to come in contact with that bone. In the *Dinocerata*, this specialization does not occur.

The face for the navicular is fully twice as large as that for the cuboid. It is somewhat convex from side to side, but is nearly flat from before backward, and is bounded along its outer, or fibular, and posterior side by a low rounded ridge, indicating the limit of the cuboid face. This facet is more or less triangular in outline, the apex pointing backward and inward. It is only moderately convex.

The relation of the navicular face to the articulation for the tibiale bone is well shown in woodcuts 140 and 142, below.

The outer, or fibular, side of the astragalus (Plate XLVII, figure 4) presents a convex articulation for the fibula. This face is confluent above, with the tibial surface, and usually, also, in a much less degree, with the outer face for the calcaneum. In some specimens, however (numbers 1248, 1528, 1531), these faces are quite separated.

In an anterior view of the astragalus (figure 5), the exterior, or dermal, surface is seen to be very short, proportionally shorter than in the elephant, but varying within such limits that the longest in the *Dinocerata* may nearly or quite equal in length the shortest in the elephant.

Posteriorly, the astragalus extends backward much farther on the inner, or tibial, side than on the outer side, and is tuberculated. This surface of the bone is, in some specimens, deeply notched near the middle, as in figures 141 and 142, below, but more commonly the notch is converted into a foramen by a bridge of bone, as in Plate XLVII, figure 6, and figures 139 and 140, below. The tibial articular surface is not usually confluent with the calcaneal surface, as is sometimes the case in the elephant. A near approach to confluence is seen in one specimen, number 1209.

The astragalus in *Coryphodon* is very similar in form to that in the *Dinocerata*, but is shorter. It has essentially the same articular faces, and the facet for the tibiale is equally well marked. The hind foot of *Coryphodon* is shown in figure 151, in Chapter XIV. Its general resemblance to the corresponding foot in *Dinoceras* is striking, and the structure of the two is essentially the same. The resemblance between the fore foot of *Dinoceras* and that of *Coryphodon* is equally marked.

The astragalus in one individual of *Dinoceras*, and in one of *Tinoceras*, is represented in the woodcuts below.

Measurements of the astragalus in four individuals of the *Dinocerata* are as follows:

Measurements of the Left Astragalus. (Dinoceras mirabile, No. 1210.)

	m.
Greatest antero-posterior diameter of astragalus,	.112
Greatest transverse diameter,	.121
Greatest vertical diameter,	.070
Greatest diameter of articular face for tibia,	.110
Antero-posterior diameters of articular face for tibia,	.072-.066-.092
Transverse diameters of articular face for tibia,	.076-.071-.085
Antero-posterior diameter of articular face for fibula,	.044
Vertical diameter of articular face for fibula,	.036
Antero-posterior diameter of articular face for calcaneum,	.054
Transverse diameter of articular face for calcaneum,	.080
Transverse diameter of articular face for calcaneum, outer lobe,	.033
Transverse diameter of articular face for calcaneum, inner lobe,	.040
Diameter of band connecting lobes,	.018
Antero-posterior diameter of united faces for navicular and cuboid,	.056
Transverse diameter of united faces for navicular and cuboid,	.107
Diameters of face for navicular,	.056-.082
Diameters of face for cuboid,	.035-.062
Minimum length of neck,	.014

Measurements of Left Astragalus. (Dinoceras laticeps, No. 1197.)

	m.
Greatest antero-posterior diameter of astragalus,	.128
Greatest transverse diameter,	.128
Greatest vertical diameter,	.080
Greatest diameter of articular face for tibia,	.127
Antero-posterior diameters of articular face for tibia,	.089-.080-.105
Transverse diameters of articular face for tibia,	.090-.085-.091
Antero-posterior diameter of articular face for fibula,	.055
Vertical diameter of articular face for fibula,	.031
Antero-posterior diameter of outer articular face for calcaneum,	.053
Transverse diameter of outer articular face for calcaneum,	.048
Antero-posterior diameter of inner articular face for calcaneum,	.061
Transverse diameter of inner articular face for calcaneum,	.035
Distance between inner and outer faces for calcaneum,	.009
Antero-posterior diameter of united faces for navicular and cuboid,	.072
Transverse diameter of united faces for navicular and cuboid,	.113
Diameters of face for navicular,	.064-.091
Diameters of face for cuboid,	.031-.071
Minimum length of neck,	.016

Measurements of Left Astragalus. (Tinoceras ingens, No. 1209.)

Greatest transverse diameter,	.147
Greatest vertical diameter,	.083
Greatest diameter of articular face for tibia,	.125
Antero-posterior diameters of articular face for tibia,	.091-.082-.104
Transverse diameters of articular face for tibia,	.094-.096-.095
Antero-posterior diameter of articular face for fibula,	.060
Vertical diameter of articular face for fibula,	.039
Antero-posterior diameter of outer articular face for calcaneum,	.050
Transverse diameter of outer articular face for calcaneum,	.050
Antero-posterior diameter of inner articular face for calcaneum,	.058
Transverse diameters of inner articular face for calcaneum,	.033-.050
Distance between inner and outer faces for calcaneum,	.018
Antero-posterior diameter of united faces for navicular and cuboid,	.068
Transverse diameter of united faces for navicular and cuboid,	.130
Diameters of face for navicular,	.068-.105
Diameters of face for cuboid,	.042-.077
Minimum length of neck,	.019

Measurements of Right Astragalus. (Dinoceras mirabile, No. 1528.)

	m.
Greatest antero-posterior diameter of astragalus,	.100
Greatest transverse diameter,	.108
Greatest vertical diameter,	.063
Greatest diameter of articular face for tibia,	.100
Antero-posterior diameters of articular face for tibia,	.070-.060-.093
Transverse diameters of articular face for tibia,	.067-.067-.070
Antero-posterior diameter of articular face for fibula,	.040
Vertical diameter of articular face for fibula,	.030
Antero-posterior diameter of outer articular face for calcaneum,	.035
Transverse diameter of outer articular face for calcaneum,	.039
Antero-posterior diameter of inner articular face for calcaneum,	.040
Transverse diameter of inner articular face for calcaneum,	.040
Antero-posterior diameter of united articular faces for navicular and cuboid,	.053
Transverse diameter of united articular faces for navicular and cuboid,	.093
Diameters of face for navicular,	.076-.053
Diameters of face for cuboid,	.026-.055
Minimum length of neck,	.015

THE CALCANEUM.

(Plate XLVIII, Plate LIV, figure 2, *c*; and
woodcuts 143-144, below.)

The calcaneum in the *Dinocerata* is short, and comparatively more robust, than in the elephant. As in that animal, it is strongly tuberculated

below, where, during life, it doubtless supported a thick pad, resting on the ground.

The calcaneum articulated mainly with two bones, the astragalus and the cuboid. Some specimens, and perhaps all, present a small face where the fibula touched this bone.

The articulation with the astragalus is, in most specimens, divided into two distinct facets (figures 144, *a* and *a'*) by a deep groove. In some cases, however, these facets are coalescent posteriorly, as in Plate XLVIII, figures 1 and 5, and in figure 143, corresponding with a similar coalescence of faces on the astragalus.

The face for the cuboid is small, and irregularly rounded, or oval, as seen in Plate XLVIII, figure 1, and is usually more or less confluent with the inner face for the astragalus, but is well separated from the outer face for that bone.

The great tuberosity for the attachment of the tendo Achillis is very short, proportionally shorter than in the elephant.

FIG. 143.

FIG. 144.

FIGURE 143.—Calcaneum of *Dinoceras mirabile*, Marsh (No. 1210); top view.FIGURE 144.—Calcaneum of *Dinoceras mirabile*, (No. 1208); top view.

a. and *a'*, faces for astragalus.

Both figures are one-half natural size

Two specimens of the calcaneum in different individuals of *Dinoceras* are represented in the woodcuts above.

Measurements of three specimens of the calcaneum in the *Dinocerata* are as follows:

Measurements of Left Calcaneum. (Dinoceras mirabile, No. 1210.)

	m.
Length of calcaneum, from great tuberosity to face for cuboid,	.096
Transverse diameter,	.090
Vertical diameter,	.070
Antero-posterior diameter of inner lobe of articulation for astragalus,	.050
Transverse diameter of inner lobe of articulation for astragalus,	.043
Antero-posterior diameter of outer lobe of articulation for astragalus,	.043
Transverse diameter of outer lobe of articulation for astragalus (approximate), ---	.039

Measurements of Right Calcaneum. (Dinoceras mirabile, No. 1225.)

	m.
Length of calcaneum, from great tuberosity to face for cuboid,	.107
Transverse diameter (approximate),	.086
Vertical diameter,	.074
Antero-posterior diameter of inner face for astragalus,	.053
Transverse diameter of inner face for astragalus,	.037
Antero-posterior diameter of outer face for astragalus,	.045
Transverse diameter of outer face for astragalus (approximate),	.037
Distance between inner and outer faces for astragalus,	.010

Measurements of Left Calcaneum. (Dinoceras mirabile, No. 1208.)

	m.
Length of calcaneum, from great tuberosity to face for cuboid,	.093
Transverse diameter,	.086
Vertical diameter,	.074
Antero-posterior diameter of inner face for astragalus,	.044
Transverse diameter of inner face for astragalus,	.042
Antero-posterior diameter of outer face for astragalus,	.050
Transverse diameter of outer face for astragalus,	.032
Distance between faces for astragalus,	.070
Transverse diameter of face for cuboid,	.035
Vertical diameter of face for cuboid,	.019

THE CUBOID.

(Plate XLIX, figures 1-6, Plate LIV, figure 2, *cb*; and woodcuts 145-146, below.)

The cuboid in the *Dinocerata* corresponds in general with that of the elephant, and presents similar articular faces, though not to the same bones. It is also more elongated in the line of the axis of the foot, thus appearing less flattened than in the *Proboscidea*. In general shape, the bone is triangular, the longest side being nearly straight, and lying along the inner, or side for the navicular, while the shortest side is somewhat curved, and is presented to the exterior, or dorsal, surface of the foot.

This surface (Plate XLIX, figure 1) is moderately roughened, especially at the edges, for attachments of ligaments. The outer, or fibular, side, shown best in figure 4, is short along the line of the foot, being encroached upon by the articular face for the calcaneum on the proximal end, and one for the fifth metatarsal on the distal end.

The plantar aspect of the bone (figure 3) presents a single, or bifid, tubercle, and, on the inner face (figure 2), is an elongate articular surface for union with the navicular. This surface is confluent with the face for articulation with the astragalus, and thus serves to distinguish the proximal from the distal end of the bone, which often closely resemble each other.

The proximal surface (figure 5) is covered by two articular facets. The inner one, large and sub-triangular, concave in both directions, and nearly perpendicular to the axis of the bone, moved, during life, upon the outer distal face of the astragalus. This face is, in the specimen figured on the Plate, widely confluent with a smaller oval face for the calcaneum. In figure 146, below, the face for the calcaneum (*c*) is much less widely confluent with that for the astragalus, being nearly separated from it. In both specimens, the calcaneal face is slightly convex transversely, and somewhat inclined to the axis of the bone.

FIG. 146.

FIG. 145.

FIGURE 146.—The same bone; proximal end.

a. face for astragalus; *c.* face for calcaneum; *mt IV.* face for fourth metacarpal; *n.* face for navicular.
Both figures are one-half natural size.

The cuboid bone in one individual of *Dinoceras* is represented in the two cuts above.

The distal face (Plate XLIX, figure 6) also presents two articular surfaces, for the support of the fourth and fifth metatarsal bones. The

face for the fourth metatarsal is much the larger. It is narrow, or pointed, below, and moderately concave, or, in the lower part, slightly convex, from above downward, and is at right angles with the axis of the bone. The smaller outer face, supporting the fifth metatarsal, is turned somewhat outward, and is slightly convex in both directions.

The principal dimensions of the two cuboid bones above described are as follows:

Measurements of Left Cuboid. (Dinoceras mirabile, No. 1208.)

	m.
Length of cuboid, along axis of foot,.....	.035
Transverse diameter,.....	.054
Antero-posterior diameter,.....	.060
Antero-posterior diameter of face for astragalus,	.055
Transverse diameter of face for astragalus,	.034
Antero-posterior diameter of face for cuboid,	.035
Transverse diameter of face for cuboid,.....	.020
Antero-posterior diameter of face for fourth metatarsal,	.049
Transverse diameter of face for fourth metatarsal,	.032
Antero-posterior diameter of face for fifth metatarsal,.....	.035
Transverse diameter of face for fifth metatarsal,.....	.022

Measurements of Right Cuboid. (Dinoceras mirabile, No. 1528.)

	m.
Length of cuboid, along axis of foot,.....	.037
Transverse diameter,.....	.066
Antero-posterior diameter,	.065
Antero-posterior diameter of face for astragalus,	.058
Transverse diameter of face for astragalus,	.036
Antero-posterior diameter of face for cuboid,.....	.032
Transverse diameter of face for cuboid,.....	.026
Antero-posterior diameter of face for fourth metatarsal,	.049
Transverse diameter of face for fourth metatarsal,	.035
Antero-posterior diameter of face for fifth metatarsal,.....	.039
Transverse diameter of face for fifth metatarsal,	.032

THE NAVICULAR.

(Plate XLIX, figures 7-12, and Plate LIV, figure 2, *n.*)

The navicular is a short bone in the *Dinocerata*, strongly flattened vertically, much as in the elephant. It is supported by the astragalus, and does not usually, as in that animal, touch the calcaneum. It supports only the three cuneiform bones in front, but presents a narrow, lateral, articular face to the cuboid.

The surface of the navicular exposed upon the dorsal aspect of the foot (Plate XLIX, figure 7) is short vertically, more or less rounded from side to side, and varies much in the degree of smoothness, or tuberculation, in different specimens.

The under, or plantar, surface, shown in figure 9, projects into a large rounded tubercle, and is of considerably greater extent along the axis of the foot than above.

The outer surface (figure 10), presented to the cuboid, is more or less covered by an articular face, extending along the proximal margin of the bone, confluent with the astragalar face, and, in life, moving upon a corresponding face upon the inner side of the cuboid.

The proximal surface of the bone (figure 11) is mostly occupied by a large articular surface, for union with the astragalus. This surface is somewhat saddle-shaped, being distinctly concave transversely, but somewhat convex from above downward. Below the articular face, the bone usually extends into a strong plantar tubercle, which may, however, (number 1218) be much less developed than in the specimen figured.

None of the specimens present any indication, on the proximal face, of a surface for articulation with the calcaneum, such as is found on the corresponding bone of the elephant.

The distal surface of the navicular (figure 12) presents three articular faces, one for each of the cuneiform bones. These faces are confluent with each other, and the inner one, for the entocuneiform, may be small, and indistinct. Usually, it is of considerable size, and elongated from above downward. It is oval in shape, moderately convex in both directions, and oblique to the axis of the bone, looking somewhat outward.

The median of the three faces is sub-quadrate in outline, a little broader above than below, and confluent, on each side, with the adjacent faces. This face is slightly concave from side to side, and from above downward, nearly flat.

The face for the ectocuneiform is sub-quadrate, tapering below, concave in both directions, or nearly flat from above downward.

These faces may all be considerably shorter and broader than in the specimen figured, and the face for the entocuneiform may be very greatly reduced.

The following measurements of three specimens of the navicular in *Dinoceras* show the more important dimensions of this bone :

Measurements of Left Navicular. (Dinoceras mirabile, No. 1247.)

	m.
Transverse diameter of navicular,	.085
Antero-posterior diameters (axial),	.015-.029
Transverse diameter of face for astragalus,	.080
Vertical diameter of face for astragalus,	.060
Transverse diameter of face for entocuneiform,	.020
Vertical diameter of face for entocuneiform,	.050
Transverse diameter of face for mesocuneiform,	.025
Vertical diameter of face for mesocuneiform,	.045
Transverse diameter of face for ectocuneiform,	.035
Vertical diameter of face for ectocuneiform (approximate),	.055

Measurements of Left Navicular. (Dinoceras mirabile, No. 1208.)

	m.
Transverse diameter of navicular,	.067
Antero-posterior diameters,	.015-.025
Vertical diameter,	.069
Transverse diameter of face for astragalus,	.058
Vertical diameter of face for astragalus,	.051
Transverse diameter of face for entocuneiform,	.022
Vertical diameter of face for entocuneiform,	.033
Transverse diameter of face for mesocuneiform,	.026
Vertical diameter of face for mesocuneiform,	.043
Transverse diameter of face for ectocuneiform,	.032
Vertical diameter of face for ectocuneiform,	.040

Measurements of Left Navicular. (Dinoceras mirabile, No. 1218.)

	m.
Transverse diameter of navicular,	.082
Antero-posterior diameters,	.015-.022
Vertical diameter,	.065
Transverse diameter of face for astragalus,	.065
Vertical diameter of face for astragalus,	.050
Transverse diameter of face for entocuneiform (approximate),	.012
Vertical diameter of face for entocuneiform,	.028
Transverse diameter of face for mesocuneiform,	.029
Vertical diameter of face for mesocuneiform (approximate),	.045
Transverse diameter of face for ectocuneiform,	.037
Vertical diameter of face for ectocuneiform,	.052

THE ENTOCUNEIFORM.

(Plate L, figures 1-6, and Plate LIV, figure 2, *en.*)

The entocuneiform in the *Dinocerata* bears but slight resemblance to the corresponding bone in the elephant. It is much less elongated in the line of the axis of the foot, and even less so than appears in the general view of the hind foot on Plate LIV, since the elongation apparent in that figure is, to a great extent, in front of the articular surfaces. These surfaces are, at their nearest points, scarcely more widely separated in the direction of the axis of the foot, than are those of the other cuneiform bones.

The dermal surface of the bone (Plate L, figure 1) is rough and tuberculated, often much more so than represented in the figure. It is also usually more elongated in the axial direction, in front of the articular surfaces.

The opposite surface of the bone (figure 3) is flattened, and moderately roughened, and presents a small area only for articulation with the mesocuneiform. This articular face is confluent with the face for the navicular, and lies along the anterior part of its margin.

The proximal articular face (figure 5) is of a semi-oval form, and is more or less concave in a direction from the dorsal toward the plantar side of the foot, while transversely it is moderately convex.

The distal face (figure 6) is much more distinctly saddle-shaped. In some specimens, it is strongly curved forward in the superior region of the bone, so as to extend through a considerable arch in the direction from the dorsal toward the plantar side of the foot. Transversely, the articulation is moderately convex throughout.

THE MESOCUNEIFORM.

(Plate L, figures 7-12.)

The mesocuneiform is a small, somewhat wedge-shaped bone, tapering toward its plantar extremity, and having its shortest dimension in the line of the axis of the foot. It is much less oblique than the corresponding bone in the elephant, and also less decidedly wedge-shaped.

The dorsal surface of the bone (Plate L, figure 7) is rugose and tuberculated, and the plantar extremity (figure 9) also presents a rather prominent protuberance.

Of the lateral faces, the inner (figure 8), turned toward the entocuneiform, presents, along the proximal part of its margin, a more or less elongated facet, for articulation with that bone. The opposite side (figure 10) turned toward the ectocuneiform, is moderately rough, and destitute of any articular face.

The proximal articular face (figure 11) is nearly flat, slightly broader above than below, and, along the inner margin, confluent with the lateral face for articulation with the entocuneiform.

The distal face (figure 12) is also nearly flat, and, in life, supported in part, but not entirely, the second metatarsal bone. The latter presented nearly as large a face to the ectocuneiform, as to the mesocuneiform.

The following measurements give the principal dimensions of this bone in two specimens of *Dinoceras mirabile*:

Measurements of Left Mesocuneiform. (Dinoceras mirabile, No. 1210.)

Greatest diameter of mesocuneiform,	m. 058
Transverse diameter,	.032
Antero-posterior diameters (axial),	.014-.020

Measurements of Left Mesocuneiform. (Dinoceras mirabile, No. 1208.)

Greatest diameter of mesocuneiform,	m. .053
Transverse diameter,	.026
Antero-posterior diameters (axial),	.014-.018

THE ECTOCUNEIFORM.

(Plate L, figures 13-18.)

The ectocuneiform is triangular in outline, tapering distinctly, and in most specimens nearly to a point, toward the palmar surface of the foot. It is much less oblique than the corresponding bone in the elephant, and usually has the two distal faces more distinctly marked. It is also proportionally less elongated from the dorsal toward the plantar side of the foot.

The dorsal, or dermal, face (Plate L, figure 13) is roughened for ligamentary attachment, and on the opposite, or plantar, side, the bone is produced into a more or less prominent tubercle (figure 15). In the natural position, during life, this elevation was just back of the proximal end of the third metatarsal.

The lateral surfaces of the ectocuneiform (figures 14 and 16) are moderately roughened, and do not present articular surfaces for either the mesocuneiform on the inner side, or for the cuboid on the outer side.

The proximal articular face (figure 17) is nearly flat, or slightly convex transversely, while, in a dorso-plantar direction, it may be more or less concave.

The distal surface (figure 18) presents two confluent, but usually well marked, articular surfaces. Of these, the inner is narrow and oblique, and supported, in life, the outer part of the second metatarsal. The principal articular face of the distal end is nearly flat, sub-triangular in outline, and narrowed toward the plantar end. In life, it supported the third metatarsal bone.

The tubercle upon the plantar side of this bone differs considerably in size and form (numbers 1202 and 1229). The degree of distinction between the two distal faces also varies in different specimens (numbers 1208, 1232, and 1199).

The more important measurements of the ectocuneiform in four specimens of *Dinoceras* are given below.

Measurements of Right Ectocuneiform. (Dinoceras mirabile, No. 1199).

	m.
Greatest diameter of ectocuneiform,	.066
Transverse diameter,	.045
Antero-posterior diameters,	.014-.026
Diameters of proximal articular face,	.030-.048

Measurements of Left Ectocuneiform. (Dinoceras laticeps, No. 1202.)

	m.
Greatest diameter of ectocuneiform,	.060
Transverse diameter,	.040
Antero-posterior diameters,	.017-.024
Diameters of proximal articular face,	.033-.050

Measurements of Left Ectocuneiform. (Dinoceras mirabile, No. 1208.)

Greatest diameter of ectocuneiform,-----	m. .055
Transverse diameter,-----	.035
Antero-posterior diameters,-----	.016-.021
Diameters of proximal articular face,-----	.028-.039

Measurements of Left Ectocuneiform. (Dinoceras mirabile, No. 1232.)

Greatest diameter of ectocuneiform,-----	m. .064
Transverse diameter,-----	.044
Antero-posterior diameters (axial),-----	.014-.022
Diameters of proximal articular face,-----	.032-.046

THE FIRST METATARSAL.

(Plate LI, figures 1-6, and Plate LIV, figure 2.)

The first metatarsal bone of the *Dinocerata* is the shortest and smallest of the five, but is comparatively much better developed than in the elephant.

The first metatarsal in *Dinoceras mirabile* is short and stout, and strongly roughened on all sides throughout its length, as seen in Plate LI, figures 1-4. As in the other metatarsals preserved, there are no distinct indications of epiphysial sutures.

This bone does not appear, during life, to have been in very close relation with the adjoining metatarsal, and accordingly presents, on its proximal end (figure 5), only a single articular surface, which is distinctly saddle-shaped, and joined the entocuneiform.

The distal end (figure 6) presents a flattened, and somewhat concave, face for the first phalanx, and immediately below this, are grooves for a pair of sesamoid bones.

THE SECOND METATARSAL.

(Plate LI, figures 7-12, and Plate LIV, figure 2.)

The second metatarsal in *Dinoceras* is the most robust of the series, and is a short, and very stout bone.

The surface of the shaft, as seen in Plate LI, figures 7-10, is

roughened at both the proximal and distal ends, but medially it is smoother and constricted, especially below, where a large, and prominent, tubercle occupies the proximal portion of the under surface of the bone. This tubercle is shown in figure 9, and also, in profile, in figures 8 and 10, where it is seen to project considerably beyond the proximal articular face.

The proximal end of the bone (figure 11) is oblique to its axis, and presents two distinct articular faces; the larger on the inner, or tibial, side of the bone, for the mesocuneiform, and the outer, on the fibular side, for the ectocuneiform. The latter face is also confluent with a lateral facet, where the bone, during life, touched the third metatarsal. This face is well shown in figure 10.

The distal end (figure 12) is large, rounded, and somewhat oblique to the axis of the bone. The articulation for the phalanx is flattened, but may be slightly convex, or, in a transverse direction, more or less concave. Two well developed sesamoids moved in broad shallow grooves below, the faces for these bones, taken together, being about as large as that for the phalanx.

THE THIRD METATARSAL.

(Plate LI, figures 13-15, Plate LII, figures 1-3, and Plate LIV, figure 2.)

The third metatarsal is of about the same length as the second and the fourth, and is a little less robust than the second.

It has a distinct shaft, which is smooth and constricted medially, but more or less roughened and tubercular toward the extremities, especially near the distal end.

The proximal face of the bone (Plate LII, figure 2) is somewhat oblique to its axis, and presents a sub-triangular articular face for the outer facet of the ectocuneiform. This facet is confluent, along its inner margin, with a small lateral face for union with the second metatarsal, as shown in Plate LI, figure 14. Opposite this, there is also an oval face (Plate LII, figure 1) supported on a flattened tubercle, and meeting, during life, a similar face on the fourth metatarsal.

The distal end (Plate LII, figure 3) is large and rounded, and, in some specimens, distinctly oblique. It supports the usual face for the first phalanx, and below, two shallow grooves for a pair of sesamoid bones. The phalangeal face is, in all the specimens preserved, distinctly, though slightly, convex in both directions.

THE FOURTH METATARSAL.

(Plate LII, figures 4-9, and Plate LIV, figure 2.)

The fourth metatarsal is of about the same size as the third, and considerably resembles it in structure. This resemblance is much greater than in the elephant, where the fourth is decidedly shorter than the third metatarsal.

The shaft of the fourth metatarsal is strongly constricted medially, as seen in Plate LII, figures 5 and 7, and bears on the under side, at the proximal end, a large projecting tubercle.

The proximal end (figure 8) bears a nearly flat articular surface, sub-triangular in outline, and nearly perpendicular to the long axis of the bone, and articulating, during life, with the cuboid bone. This surface is confluent on the outer side with a small lateral facet shown in figure 7, which corresponds with a similar face on the fifth metatarsal. On the opposite, or inner side, is an oval facet (figure 5) articulating in life, with a prominent face on the third metatarsal.

The distal end of the fourth metatarsal (figure 9) is but little oblique to the axis of the bone, and bears the usual faces, for articulation with the phalanx, and the sesamoids. The phalangeal articulation may be concave from side to side (number 1199), but is usually slightly convex in both directions.

THE FIFTH METATARSAL.

(Plate LII, figures 10-15, and Plate LIV, figure 2.)

The fifth metatarsal in *Dinoceras* is shorter than any of the others except the first, but is robust, and evidently afforded its full share of support to the foot.

Its surface is strongly tuberculated, especially on the under and outer sides, as shown in Plate LII, figures 12 and 13. The shaft, being short, does not present a median constriction, as in the three preceding metatarsals.

The proximal end (figure 14) bears a comparatively small articular face for support on the cuboid bone. This face is nearly flat, and somewhat quadrangular in outline, and is confluent, on the inner margin, with a small lateral face for the fourth metatarsal, as seen in figure 11. The proximal articular face is nearly at right angles to the axis of the bone.

The distal face (figure 15) for the proximal phalanx is turned strongly outward, and is more or less concave. The sesamoid grooves, also, look strongly outward, and the inner is larger than the outer.

THE PHALANGES.

(Plates LII-LVI.)

The phalanges of the hind foot in the *Dinocerata* are very similar to those of the fore foot, although smaller, and hence need no detailed description. In Plate LIII, these bones are well represented, and with them, some of the sesamoid bones of the same feet. In Plate LIV, figure 2, the phalanges are shown in position, and other views of them may be seen in the two restorations on Plates LV and LVI.

CHAPTER XIII.

RESTORATIONS OF DINOCERAS AND TINOCERAS.

(Plates LV and LVI.)

THE preceding chapters of this memoir, and the illustrations given in Plates I–LIV, will make known to anatomists nearly all the important characters in the skeleton of the gigantic mammals of the order *Dinocerata*. In Plate LV, a restoration is given of *Dinoceras mirabile*, the type of the group, and, in Plate LVI, one also of *Tinoceras ingens*, a characteristic, and more specialized form of an allied genus.

The remains available for these restorations consist of portions of more than two hundred individuals of the *Dinocerata*. As none of the skeletons of the species here represented were complete when found, it has been necessary to use, in both restorations, the bones of other individuals which could not be distinguished from the type specimens. Some of these bones may, perhaps, belong to allied forms, but it is believed that the restorations, as here given, fairly represent the skeletons of the species named.

In the restoration of *Dinoceras mirabile* on Plate LV, the remains of the type specimen of the species, a fully adult, but not old individual, have been used for the more important parts, and the remaining portions taken from other individuals. This restoration is one-eighth natural size.

The animal is represented as walking, and the position of the head, and the feet, has been chosen to show, to the best advantage, these portions of the skeleton as they were in life. In this restoration, only those portions are shaded which are represented by actual specimens in the Yale Museum. The parts in outline are either wanting, or so poorly preserved that only their main features can be given with accuracy.

In the restoration of *Tinoceras ingens*, Plate LVI, the animal is represented one-sixth natural size, and standing at rest. The position here chosen shows the massive and majestic form of one of the largest individuals of this remarkable group. Here, likewise, the shaded portions are represented by specimens in the Yale Museum. Some of these bones were used also in the first restoration.

In comparing *Dinoceras*, as here restored, with some of the largest ungulate mammals of the present day, a certain resemblance to the rhinoceros on the one hand, and to the elephant on the other, will naturally suggest itself. In size and proportions, *Dinoceras* was intermediate between these two existing animals, and in various points of its structure, it resembled the one quite as much as the other. In still other features, *Dinoceras* resembled the hippopotamus, and its affinities with the groups represented by these three types will be discussed in the succeeding chapter.

In its stature and movements, *Dinoceras* probably resembled the elephant as much as any other existing form. Its remarkable skull, longer neck, and more bent fore limbs, gave it, however, a very different appearance from any known Proboscidian. The high protuberances on the head, the long trenchant canine tusks, and the peculiar lower jaw modified for their protection, are features seen together only in this group.

The neck was long enough to permit the head to reach the ground, and hence a proboscis was quite unnecessary. The horizontal narial opening, the long overhanging nasal bones, and the well developed turbinal bones, are likewise proof positive against the presence of such an organ. There is some evidence of a thick flexible lip, resembling, perhaps, that of the existing rhinoceros.

The remarkably small brain, and the heavy massive limbs, indicate a dull, slow-moving animal, little fitted to withstand sudden changes in its environment, and hence it did not survive the alterations of climate with which the Eocene period closed.

That the *Dinocerata* were very abundant for a long time during the middle Eocene is proved, conclusively, by their numerous remains in deposits of this age. That the animals lived in herds is also suggested by the position in which the remains are found. Their favorite resorts would seem to have been around the borders of the great Eocene tropical lake described in the Introduction of the present volume. Here, they found an abundance of food, which was evidently the soft succulent vegetation which flourished, then as now, in such localities.

In *Tinoceras*, represented in Plate LVI, we have the skeleton of a larger, and still more imposing animal, but with essentially the same characteristics. The remains of this genus are found in the same lake-basin as those of *Dinoceras*, but at a higher level, and the evidence is clear that *Tinoceras* is a later, and more specialized form.

Both the animals chosen for these two restorations were evidently males, as shown by the lofty protuberances, or horn-cores, on the skull, and the powerful canine tusks. In the females, these parts are but feebly developed, as seen in the specimens described in the preceding chapters. The individuals here restored were certainly thrice-armed, and well fitted to protect themselves, and their weaker associates, from any of their Eocene enemies.

The exact form and nature of the offensive weapons which surmounted the head of the *Dinocerata* cannot, at present, be determined with certainty. That the paired osseous elevations on the skull in all the known species of this group did not support the kind of horns seen in the typical Ruminants is evident from their external surface, which lacks the vascular grooves so distinct on the horn-cores of those animals.

Possibly the *Dinocerata* may have been armed with horns similar to those seen in the American antelope (*Antilocapra*), since, in this animal, the horn-cores are even smoother than in the order here described. More probably, however, the bony protuberances on the skull were covered with bosses of thick skin, hard enough to be effective in combat. Evidence of such contests has apparently been recorded in the injuries to the horn-cores of some individuals, received during life. None of the covering of these elevations, or horn-cores, has, of course, been preserved; yet a fortunate discovery may, perhaps, reveal their nature by the form of a natural cast, as the eye-ball of the *Oreodon* is sometimes thus clearly indicated in the fine Miocene matrix which envelops these animals.

The short robust feet of the *Dinocerata* were doubtless covered below with a thick pad, as in the elephant, since the whole under side of the foot clearly indicates such a protection. No portion of this covering has been preserved in any of the known specimens, and no foot-prints, indicating its form, have been discovered in the Eocene deposits in which the *Dinocerata* were entombed.

The size of *Tinoceras ingens*, as he stood in the flesh, was about twelve feet (3.65 M.) in length, or sixteen (4.9 M.), measured from the nose to the end of the tail. The height to the top of the back was about six and one-half feet (2 M.), and the width across the hips about five feet (1.5 M.). The weight, judging from that of existing mammals, was at least six thousand pounds (2.75 T.).

Dinoceras mirabile was about one-fifth smaller. The neck was longer, but, in other respects, the proportions were nearly the same.

Dinoceras mirabile when standing at rest would have a general resemblance to a very large rhinoceros. When walking, the movement of the hind limbs would at once suggest the elephant, as we know it to-day. The movement of the head in *Dinoceras* was much freer than that in the elephant, as the neck was longer, and arched upward, and the vertebræ admitted of much more freedom of motion. The eye was small, and deep set, as in the rhinoceros. The head of *Dinoceras* must have had some resemblance to that of the hippopotamus, but was very different from that of any known animal, living or extinct.

CHAPTER XIV.

CONCLUSION.

(Plates LIV-LVI, and woodcuts 147-169, below.)

THE more important characters of the *Dinocerata*, so far as known, have been given in the preceding chapters, and the anatomist can now form a fair picture of characteristic members of the group. It remains to consider what the relations of this peculiar group are to the nearest allied forms, and, especially, to ascertain, if possible, whether the evidence before us throws any light on the origin of the *Dinocerata*, and, more remotely, on the genealogy of all Ungulate Mammals.

The oldest known mammals are of Triassic age, but the few specimens yet discovered give little information as to the primitive forms of this class. During Jurassic time, mammals were very abundant, and deposits of this age now offer a promising field for exploration.

Of Triassic and Jurassic mammals, the author has studied with some care every known specimen in this country, and in Europe, and some of the conclusions here given are based upon this examination. Special attention has been paid to the Jurassic mammals of this country, which the author first discovered in the Rocky Mountain region. Remains of nearly four hundred individuals, representing many genera and species, have already been secured, and their investigation promises to clear up many doubtful points in the early history of this class.

No Cretaceous mammals are known, and it is this great break in the series of ancient forms that renders any satisfactory classification of the class, living and extinct, at present impossible.

At the very base of the Tertiary, we find the class of Mammals well represented by many widely separated groups, which point back to a common ancestry, only in a very remote period.

Our present knowledge of the *Mammalia*, living and extinct, clearly indicates that they must go back at least to the Permian. The generalized mammal of that period, or of still earlier time, was probably quite small, and, in many respects, like an Insectivor. This primitive type would naturally possess all the general characters found in later forms in the various orders of mammals. The characters therefore we should expect to find in this ancestral mammal would be essentially the following:

- (1.) Brain, small and smooth.
- (2.) Teeth, more than forty-four.
- (3.) Vertebrae, biconcave.
- (4.) Trunk vertebrae, more than thirty.
- (5.) Sacral vertebrae, separate.
- (6.) Intercentral bones.
- (7.) Chevron bones.
- (8.) Cervical ribs, free.
- (9.) Clavicles, free.
- (10.) Coracoids, free.
- (11.) Sternal bones, flat.
- (12.) Humerus with supra-condylar foramen.
- (13.) Feet, plantigrade.
- (14.) Five digits in manus and in pes.
- (15.) Carpal and tarsal bones not interlocking.
- (16.) Separate central bone in carpus.
- (17.) Pelvic bones, separate.
- (18.) Epipubic bones.
- (19.) Acetabular bones.
- (20.) Femur with third trochanter.
- (21.) Three bones in first tarsal row.
- (22.) Astragalus, flat.
- (23.) Fibula articulating with calcaneum.

This generalized mammal would belong to the group named *Hypotheria* by Huxley, who has laid a sure foundation for investigation in this line of research.

GENEALOGY OF UNGULATES.

From this primitive type of mammal, a special line apparently led off through the Triassic and Jurassic to the Cretaceous, where it formed a well marked group, which may be called the *Protungulata*, the probable ancestors of all succeeding Ungulate Mammals.

The characters of this type would be somewhat as follows:

- (1.) Brain, small and smooth.
- (2.) Teeth, forty-four or more.
- (3.) No frontal appendages.
- (4.) Odontoid process, conical.
- (5.) Vertebrae, flat.
- (6.) Trunk vertebrae, thirty or more.
- (7.) Chevron bones.
- (8.) Clavicles present.
- (9.) Sternal bones, flat.
- (10.) Humerus with supra-condylar foramen.
- (11.) Feet, plantigrade.
- (12.) Five digits in manus and in pes.
- (13.) Carpal and tarsal bones not interlocking.
- (14.) Separate central bone in carpus.
- (15.) Femur with third trochanter.
- (16.) Three bones in first tarsal row.
- (17.) Astragalus, flat.
- (18.) Fibula articulating with calcaneum.

From this generalized ungulate, the skeleton of which we now know almost as well apparently as if we had it before us, a direct line would appear to have continued up to the present day, and be represented by the living Hyrax. Several divergent lines passed off probably from the same stem, and three of these have continued to the present time, the survivors being the *Proboscidea*, the *Artiodactyla*, and the *Perissodactyla*.

The Proboscidian line apparently went off from the main ungulate stem in the Cretaceous. One branch ended in the later Pliocene in *Dinotherium*; another, in *Mastodon*; while the genus *Elephas* alone survives, to represent this old group.

Another strong branch, represented by a group which may be called the *Holodactyla*, probably also led off in the Cretaceous, and its typical members, at least, had the following general characters:

- (1.) Brain, small and nearly smooth.
- (2.) Teeth, forty-four.
- (3.) Post glenoid process.
- (4.) Odontoid process, conical.
- (5.) Vertebrae, flat.
- (6.) Trunk vertebrae, twenty-three or more.
- (7.) Chevron bones.
- (8.) Pelvic bones, firmly united.
- (9.) Femur with third trochanter.
- (10.) Ulna and fibula, complete.
- (11.) Fibula articulating with calcaneum.
- (12.) Five digits in manus and in pes.
- (13.) Carpal and tarsal bones more or less interlocking.
- (14.) Astragalus, nearly or quite flat.

This line evidently divided near the base of the Eocene into the great groups of Perissodactyls and Artiodactyls, each with many off-shoots, and still existing. The former are now on the decline, and have but three living representatives, the horse, the tapir, and the rhinoceros.

One off-set from the Perissodactyl line separated near the top of the Eocene, where it is represented by *Diplacodon*, and perhaps ended in the extinct *Brontotherium*, of the lower Miocene, although this line may have been continued somewhat later in the genus *Chalicotherium*.

From the Artiodactyl line, a peculiar group branched off in the early Eocene, and in the Miocene was represented by *Oreodon* and allied genera, and by later forms in the Pliocene. The Artiodactyls, now the dominant ungulates, have numerous families, and many living genera and species.

Another order, also, which may be termed the *Amblydactyla*, passed off apparently from the main ungulate stem in the Cretaceous, and became extinct in the Eocene. One branch terminated in *Coryphodon*, in the lower Eocene, and the other, represented by the *Dinocerata*, here described, came to an end in the Middle Eocene.

In figure 147, below, a diagram is given, which shows graphically these lines of descent, and the most probable genealogy of modern Ungulates. The diagram, being on a plane, can only indicate the general position of these divergent lines.

FIG. 147.

FIGURE 147.—Diagram to illustrate the genealogy of Ungulate Mammals.

A comparison of this diagram with the section on page 7 of this volume will make clear the special geological horizons of each group here referred to.

The *Hyracoidea* are represented by the existing *Hyrax*, and no fossil remains of the group are known. The principal characters of the order are as follows:

- (1.) Brain, large and convoluted.
- (2.) Canines, absent.
- (3.) Incisor tusks.
- (4.) Maxillo-turbinal bones.
- (5.) Premolar and molar teeth, similar.
- (6.) Malar bone articulating with lower jaw.
- (7.) Alisphenoid canal.
- (8.) Post-glenoid process.
- (9.) Odontoid process, conical.
- (10.) Cervical vertebræ, convexo-concave.
- (11.) Trunk vertebræ, twenty-nine or more.
- (12.) Scapula, spatulate.
- (13.) Iliac bones, parallel.
- (14.) Femur with third trochanter.
- (15.) Femur and tibia not in line.
- (16.) Ulna and fibula, complete.
- (17.) Feet, plantigrade.
- (18.) Axis of foot through third digit.
- (19.) Carpals and tarsals not interlocking.
- (20.) Central bone in carpus.
- (21.) Three bones in first tarsal row.
- (22.) Astragalus, grooved.

The Proboscidiæ, recent and extinct, may all be placed in a single order, with the following distinctive characters :

- (1.) Brain, large and convoluted.
- (2.) Canines, absent.
- (3.) Incisor tusks.
- (4.) Maxillo-turbinal bones, rudimentary.
- (5.) Malar bone forming middle of zygomatic arch.
- (6.) Post-glenoid process, absent.
- (7.) Alisphenoid canal.
- (8.) Odontoid process, conical.

- (9.) Vertebrae, flat.
- (10.) Scapula, acuminate.
- (11.) Sternal bones, flat.
- (12.) Iliac bones, transverse.
- (13.) Femur and tibia in line.
- (14.) Ulna and fibula, complete.
- (15.) Femur without third trochanter
- (16.) Feet, plantigrade.
- (17.) Axis of foot through third digit.
- (18.) Five digits in manus and pes.
- (19.) Two bones in first tarsal row.
- (20.) Carpals and tarsals, slightly interlocking.
- (21.) Astragalus, flat.
- (22.) Fibula articulating with calcaneum.

The *Holodactyla* were the direct ancestors of the great group to which both the Perissodactyls and Artiodactyls, living and extinct, belonged. The two latter form together a well marked order, which may be called the *Clinodactyla*. Their more important characters are as follows:

- (1.) Brain, moderate in size, and convoluted.
- (2.) Lower canines.
- (3.) Maxillo-turbinal bones.
- (4.) Malar bone forming front of zygomatic arch.
- (5.) Post-glenoid process.
- (6.) Cervical vertebrae, more or less convexo-concave.
- (7.) Trunk vertebrae, not more than twenty-three.
- (8.) Scapula, spatulate.
- (9.) Iliac bones, parallel.
- (10.) Femur and tibia not in line.
- (11.) Feet, digitigrade.
- (12.) Carpals and tarsals, strongly interlocking.
- (13.) Central bone, absent.
- (14.) Scaphoid articulating with magnum.
- (15.) Astragalus, grooved.

Returning now to the *Amblydactyla*, or the group from which the *Dinocerata* were evidently derived, and to which they belong, we may safely assign to them general characters as follows:

- (1.) Brain, small and smooth.
- (2.) Teeth, not more than forty-four.
- (3.) Post-glenoid process.
- (4.) Odontoid process, conical.
- (5.) Cervical vertebræ, flat.
- (6.) Trunk vertebræ, twenty-three or more.
- (7.) Scapula, acuminate.
- (8.) Feet, plantigrade.
- (9.) Five digits in manus and in pes.
- (10.) Axis of foot through third digit.
- (11.) Carpal and tarsal bones, somewhat interlocking.
- (12.) Three bones in first tarsal row.
- (13.) Astragalus, flat.
- (14.) Fibula articulating with calcaneum.
- (15.) Cuboid articulating with astragalus.

From this group came off, evidently in the late Cretaceous, first the *Coryphodontia*, having nearly all the above characters, and becoming extinct in the early Eocene. The *Dinocerata* probably branched off about the same time, and survived to the Middle Eocene, thus becoming much more specialized before their extinction.

CLASSIFICATION OF UNGULATES.

Accepting this general view of the origin of the Ungulates, living and extinct, their classification has been outlined in the diagram on page 173, and little more can now be done.

The attempts hitherto made to give a detailed classification of all the Mammalia, living and extinct, have signally failed, mainly because only a small part of even the extinct forms now known were included, and almost every new discovery tended to break down the definitions so systematically

recorded. The time for such an exhaustive classification has not yet arrived, and all that can be safely ventured upon in the present state of knowledge is to indicate the main groups, and their affinities, and await future discoveries.

Excluding the aberrant aquatic Sirenians, now regarded as of ungulate ancestry, and leaving out also *Toxodon* and other little known extinct forms, the Ungulate Mammals may then be arranged in natural groups, as follows :

CLASS MAMMALIA.

Sub-Class MONDELPHIA.

Super-Order UNGULATA.

- (1.) Order Hyracoidea.
- (2.) Order Proboscidea.
- (3.) Order Amblydactyla { Dinocerata.
Coryphodontia.
- (4.) Order Clinodactyla { Mesaxonia (Perissodactyla).
Paraxonia (Artiodactyla).

Before proceeding to discuss the relations of the *Dinocerata* to allied forms, it is important to first consider the relative value of the characters they share with these allies, and with groups still more remote.

The characters found in existing mammals, and, to a great extent, in the extinct forms from the Tertiary to the present time, are clearly of two kinds; general characters, derived from ancestral forms, and special characters, acquired in adaptation to their environment. Some of the latter may be negative characters, acquired by the disuse, or loss, of parts once advantageous.

The first series of characters are of most importance, as they indicate a genetic connection, perhaps remote, with the different groups that share them. Special characters, on the other hand, however closely they may correspond in different groups; do not necessarily indicate affinities, but may have been acquired by adaptation to peculiar surroundings, in groups quite distinct from each other.

These facts lie at the foundation of classification, and it is only by keeping the two series of characters separate, that the true relationship between different groups of animals can be made out, and their genealogy indicated with any probability.

Bearing this in mind in considering the *Dinocerata*, we must first seek to ascertain what general characters they have inherited from ancestral forms, and next what special characters they have since acquired. The relation of the group to the orders of existing Ungulates will then be indicated by ascertaining what characters, derived from a common ancestry, they share with each other, and what special characters, due, perhaps, to influences of similar nature, they possess in common.

We have seen that the primitive Mammals (*Hypotheria*) must have possessed a large number of general characters, some of which have already been given in the list on page 170. The primitive Ungulates (*Protungulata*), starting off on a particular line from the preceding type, would naturally retain nearly all these general characters, as indicated in the list on page 171. Each of the great branches that passed off from this parent stem retained a certain number of these primal characters, and some of them we find in the Ungulates of to-day.

The characters possessed by the *Holodactyla* were most of them still the ancestral features, and the *Amblydactyla*, on the line toward the *Dinocerata*, shared many of the same characters.

The *Dinocerata*, representing a further stage of progress, had still as their inheritance a number of persistent general characters. Some of these characters are the following:

- (1.) Brain, small and smooth.
- (2.) Orbit open behind.
- (3.) Post-glenoid process.
- (4.) Alisphenoid canal.
- (5.) Vertebrae, flat.
- (6.) Odontoid process, conical.
- (7.) Sternum, flat.
- (8.) Feet, plantigrade.

- (9.) Five digits in manus and in pes.
- (10.) Three bones in first tarsal row.
- (11.) Astragalus, flat.

The specialized characters of the *Dinocerata*, acquired, doubtless, since this line separated from the *Protungulata*, are as follows:

- (1.) Pre-nasal bones.
- (2.) No upper incisors.
- (3.) Canine tusks.
- (4.) Skull surmounted with protuberances.
- (5.) Condyle of lower jaw, posterior.
- (6.) Pendent processes on lower jaw.
- (7.) Iliac bones, transverse.
- (8.) Femur and tibia in line.

If we now compare the *Dinocerata* with the *Coryphodontia*, we find they agree in the following characters:

- (1.) Brain, small, and nearly smooth.
- (2.) General form of teeth.
- (3.) Temporal fossæ, widely separated.
- (4.) Post-glenoid process.
- (5.) Odontoid process, conical.
- (6.) Vertebrae, flat.
- (7.) Scapula, acuminate.
- (8.) Feet, plantigrade.
- (9.) Five digits in manus and in pes.
- (10.) Axis of foot through third digit.
- (11.) Three bones in first tarsal row.
- (12.) Astragalus, flat.
- (13.) Fibula articulating with calcaneum.
- (14.) Cuboid articulating with astragalus.

In comparing the *Dinocerata* with living forms, and first with the Proboscideans, we find certain characters common to both, some of which at least, are general features, derived from a remote common ancestry. The more important of these characters are as follows:

- (1.) Alisphenoid canal.
- (2.) Odontoid process, conical.
- (3.) Vertebrae, flat.
- (4.) Scapula, acuminate.
- (5.) Sternal bones, flat.
- (6.) Iliac bones, transverse.
- (7.) Fibula, complete.
- (8.) Femur and tibia in line.
- (9.) Femur without third trochanter.
- (10.) Five digits in manus and pes.
- (11.) Axis of foot through third digit.
- (12.) Fibula articulating with calcaneum.
- (13.) Astragalus, flat.
- (14.) Digits enclosed in a common integument.

The characters found in the *Dinocerata*, and not in the existing *Proboscidea* are more important, and more numerous. Among these characters are the following:

- (1.) Brain, small and smooth.
- (2.) No upper incisors.
- (3.) Canine teeth above and below.
- (4.) Anterior nares in front.
- (5.) Pre-nasal bones.
- (6.) Maxillo-turbinal bones, well developed.
- (7.) Skull surmounted with protuberances.
- (8.) Premaxillaries not meeting frontals.
- (9.) Malar bone forming anterior part of zygomatic arch.
- (10.) Post-glenoid process.
- (11.) Condyle of lower jaw, posterior.
- (12.) Neck of medium length.
- (13.) Three bones in first tarsal row.
- (14.) Astragalus articulating with cuboid.

If now we compare the *Dinocerata* with the Perissodactyls, we find an agreement in the following characters :

- (1.) Premolar and molar teeth similar in form.
- (2.) Nasal bones expanding posteriorly.
- (3.) Malar bone forming front of zygomatic arch.
- (4.) Alisphenoid canal.
- (5.) Posterior nares between last molars.
- (6.) Post-glenoid process.
- (7.) Carpal and tarsal bones, more or less interlocking.
- (8.) Axis of foot through third digit.
- (9.) Astragalus articulating with cuboid.

With the typical Artiodactyls, the *Dinocerata* have the following characters in common :

- (1.) Cranial protuberances in pairs.
- (2.) No upper incisors.
- (3.) Premaxillary bones uniting with maxillaries and nasals.
- (4.) Premaxillaries with palatine plates.
- (5.) Lower incisors and canine in continuous series.
- (6.) Sternal bones, flat.
- (7.) Femur without third trochanter.
- (8.) Carpal and tarsal bones, more or less interlocking.
- (9.) Fibula articulating with calcaneum.
- (10.) Astragalus articulating with cuboid.

MODIFICATION OF THE UNGULATE FOOT.

The characters of most importance in Ungulate Mammals are found in the teeth, the brain, and the feet. The last are of special interest in the present connection, as they mark the stages of development in each group from the primitive Ungulates to the highly modified forms existing to-day. A brief statement of this development will make more clear the relation of the *Dinocerata* to other groups of Ungulates, with which we have already compared them.

The most generalized limbs in any vertebrates, above the class of fishes, are seen in some of the extinct aquatic reptiles, especially in forms allied to *Ichthyosaurus*. Here, as the author has shown,¹ we may find in one group,

- (1.) Each limb a simple fin, or paddle,
- (2.) Fore and hind limbs identical in structure,
- (3.) Axis of limb through intermedial bone and third digit,
- (4.) Single bone (humerus or femur) in propodial, or first, segment,
- (5.) Three bones, including intermedial, in epipodial, or second, segment,
- (6.) Mesopodial bones (carpals or tarsals) circular disks,
- (7.) Number of digits six or more,
- (8.) Metapodial bones and phalanges circular disks,
- (9.) Phalanges, very numerous.

This is a primitive aquatic limb, flexible, but without joints, and adapted to swimming only. An example of such a limb is seen in figure 148, below.

For progression both in water and on wet ground, an essential modification of such a limb would be required, and a type seen in some of the living reptiles would gradually be developed. This limb would be jointed at two points, and have five digits, with the axis through the middle one. The foot in this limb would be very similar to the generalized foot of the primitive Mammal, and may here be taken as its representative. An example of such a foot is shown in figure 149.

In the true Ungulate Mammals, the modifications of the feet have undoubtedly taken place very nearly in the following manner:

- (1.) The primitive Ungulates (*Protungulata*) must have had plantigrade, pentadactyl, feet, with the carpals and tarsals not interlocking, either with the metapodial bones, or with their own adjoining series. This would give a weak foot, adapted especially to progression in soft

¹ Limbs of *Sauranodon*, etc., American Journal of Science, 1880.

swampy ground. This type of foot would be somewhat like that represented in figure 149, below.

FIG. 148.

FIG. 149.

FIGURE 148.—Left hind limb of *Baptanodon discus*, Marsh; seen from below; one-eighth natural size.

FIGURE 149.—Right fore foot of *Chelydra serpentina*, Linnæus; front view (after Gegenbaur).

F. femur; F'. fibula; i. intermedium; c. central bone; f. fibulare; m. metatarsals; R. radius; r. radiale; T. tibia; t. tibiale; U. ulna; u. ulnare.

The Roman numerals denote the ordinal number of each digit present, counting from the inner side of the pentadactyl foot.

(2.) For locomotion on dry hard ground, a stronger foot was required, and a modification would soon take place, in the interlocking of the metapodials with the second row of carpals or tarsals that supported them. Examples of nearly this stage are seen in the fore feet of *Coryphodon* and *Dinoceras*, as shown in figures 150 and 152, below. The fore foot of the elephant (figure 156) will also serve to illustrate the same stage.

(3.) A still stronger foot was produced by the further interlocking of both the first and second row of carpals and tarsals, as well as the latter row with the metapodials below. This general type of foot belongs to the *Holodactyla*, and is seen also in some of the early Perissodactyls.

During these two stages of modification, or at a later period, a reduction in the number of digits in some forms also took place, evidently as a result of the same causes. As progression on dry land with the plantigrade five-toed foot began, the first digit, being the shortest of the series, soon left the ground, and was gradually lost.

FIG. 150.

FIG. 151.

FIGURE 150.—Left fore foot of *Coryphodon hamatus*, Marsh, front view.

FIGURE 151.—Left hind foot of same.

Both figures are one-third natural size.

FIG. 152.

FIG. 153.

FIGURE 152.—Left fore foot of *Dinoceras mirabile*, Marsh.

FIGURE 153.—Left hind foot of same.

Both figures are one-fifth natural size.

The four remaining digits, having to do the work of five, were strengthened by the interlocking already mentioned, and also by coming nearer together.

(4.) In the next change that occurred, two kinds of reduction began. One leading to the existing Perissodactyl foot, and the other, apparently later, resulting in the Artiodactyl type. In the former, the axis of the foot remained in the middle of the third digit, as in the

pentadactyl foot. In the latter, it shifted to the outer side of this digit, or between the third and fourth toes. An example of the former is seen in the fore foot of *Brontotherium* and *Rhinoceros*, figures 158 and 160, below, while *Oreodon* and the hippopotamus, figures 162–165, show the latter type.

FIGURE 154.—Left fore foot of *Hyrax capensis*, Schrebr.

FIGURE 155.—Left hind foot of same.

c. central bone; cI. entocuneiform; p. pisiform; t. tibiale.

Both figures are natural size.

FIGURE 156 —Left fore foot of *Elephas Indicus*, Linnaeus.

FIGURE 157.—Left hind foot of same.

Both figures are one-eighth natural size.

The position of the axis is the distinctive feature between these two types of feet, and not the number of toes, as the names usually applied to them indicate. In this respect, the terms Artiodactyl and Perissodactyl are misleading, and hence the names *Paraxonia* and *Mesaxonia* were proposed by the author, as substitutes, to express the true axial relation.

FIG. 158.

FIG. 159.

FIGURE 158.—Left fore foot of *Rhinoceros bicornis*, Linnaeus.

FIGURE 159.—Left hind foot of same.

Both figures are one-eighth natural size.

FIG. 161.

FIG. 160.

FIGURE 160 —Right fore foot of *Brontotherium ingens*, Marsh.

FIGURE 161.—Right hind foot of same.

Both figures are one-sixth natural size.

(5.) In the further reduction of the Perissodactyl foot, the fifth digit, being shorter than the remaining three, next left the ground, and

FIGURE 162.—Left fore foot of *Eporeodon socialis*, Marsh.

FIGURE 163.—Left hind foot of same.

Both figures are one-third natural size.

FIGURE 164.—Left fore foot of *Hippopotamus amphibius*, Linnaeus.

FIGURE 165.—Left hind foot of same.

Both figures are one-eighth natural size.

gradually disappeared. Of the three remaining toes, the middle, or axial, one was the longest, and retaining its supremacy, as greater strength and speed were required, finally assumed the chief support of the foot, while

the outer digits left the ground, ceased to be of use, and were lost, except as splint bones. The foot of the existing horse (figures 166 and 167) shows the best example of this reduction in the Perissodactyls, as it is the most specialized known in the Ungulates.

FIGURE 166.—Left fore foot of horse (*Equus caballus*, Linnæus).

FIGURE 167.—Left hind foot of same.

Both figures are one-eighth natural size.

FIGURE 168.—Left fore foot of goat (*Capra hircus*, Linnæus).

FIGURE 169.—Left hind foot of same.

Both figures are one-fifth natural size.

(6.) In the Artiodactyl foot, the reduction resulted in the gradual diminution of the two outer of the four remaining toes, the third and fourth doing all the work, and thus increasing in size and power. The fifth digit, for the same reasons as in the Perissodactyl foot, first left the ground, and became smaller. Next, the second soon followed, and these two gradually ceased to be functional, or were lost entirely, as in some of the Artiodactyls of to-day. The feet of the goat, figures 168 and 169, above, show this extreme reduction.

As the author has shown elsewhere, these reductions of the feet, and of the entire limbs, led to greater strength and speed, as the motion, before irregular, gradually came to act in a single plane.

The limb of the modern race-horse is a nearly perfect piece of machinery, especially adapted to great speed on dry, level, ground. The limb of an antelope, or deer, is likewise well fitted for rapid motion on a plain, but the foot itself is adapted to rough mountain work, as well, and it is to this advantage, in part, that the Artiodactyls owe their present supremacy.

The plantigrade, pentadactyl, foot of the primitive Ungulate, and even the Perissodactyl foot that succeeded it, both belong to the past humid period of the world's history. As the surface of the earth slowly dried up, in the gradual desiccation still in progress, new types of feet became a necessity, and the horse, antelope, and camel, were gradually developed, to meet the altered conditions.

The Proboscidiens and Perissodactyls now living, except the horse, are doomed to early extinction, but the Artiodactyls, with their greater power of adaptation, will replace them, and perhaps develop new forms.

The genealogy of the special Ungulate lines which ended in the horse, tapir, and rhinoceros, of the Perissodactyls, and of the pig, camel, and deer, among the Artiodactyls, has already been marked out by the author elsewhere,¹ and need not here be repeated, especially as the subject will be fully discussed in a future volume.

EXTINCTION OF LARGE MAMMALS.

During the Mesozoic period, all the mammals appear to have been small, and it is not probable that any of large size existed, as reptilian life then reigned supreme. With the dawn of the Tertiary, a new era began, and mammalian life first found the conditions for its full and rapid development.

In the lower Eocene, the largest land mammal was *Coryphodon*, more than the equal, in size and power, of any of the reptiles of that time. *Dinoceras* and its allies, in the middle Eocene, were much larger, and were

¹ Introduction and Succession of Vertebrate Life in America, 1877. See also New Equine Mammals, etc., 1874, and Polydactyle Horses Recent and Extinct, 1879.

clearly the monarchs of the region in which they lived. In the upper Eocene, *Diplacodon*, about the size of the rhinoceros, was the largest mammal, but each of these three died out in the period in which it flourished.

At the base of the Miocene, the huge *Brontotheridæ*, nearly as large as the elephant, suddenly appear in great numbers. They remained for a short time the dominant land animals, and then became extinct.

The Proboscidiæ were the giants of the Pliocene, and hold the supremacy in size to-day, but are evidently a declining race, and must soon disappear.

The cause of the successive disappearance of each group of these large Tertiary mammals is not difficult to find. The small brain, highly specialized characters, and huge bulk, rendered them incapable of adapting themselves to new conditions, and a change of surroundings brought extinction. Smaller mammals, with larger brains, and more plastic structure, readily adapt themselves to their environment, and survive, or even send off new and vigorous lines.

The *Dinocerata*, with their very diminutive brain, fixed characters, and massive frames, flourished as long as the conditions were especially favorable, but, with the first geological change, they perished, and left no descendants.

CLASSIFICATION OF DINOCERATA.

The relations of the *Dinocerata* to other orders of mammals have now been fully considered in the preceding pages, and the main conclusions reached are given on pages 173 and 177. The generic sub-divisions of this group do not appear widely separated from each other, although at least three types, from successive geological horizons, can be distinguished. The species are numerous, and well marked, and there is strong evidence that many, if not all of them are from separate horizons. The differences due to age and sex are also manifest, and have been duly considered in estimating distinctive characters.

The *Dinocerata* now known may be placed in three genera: *Dinoceras*, *Tinoceras*, and *Uintatherium*. These may be separated by characters of the skull, vertebræ, and feet. There are also indications of several intermediate forms, which may, perhaps, be found to represent sub-genera, when additional specimens in good preservation are secured for comparison. Twenty-nine species may be distinguished, mainly by the skull alone, which, at present, offers the best distinctive characters.

Sub-order DINOCERATA, Marsh.

Family TINOCERATIDÆ, Marsh.

<i>Uintatherium</i> , Leidy.	<i>Dinoceras</i> , Marsh.	<i>Tinoceras</i> , Marsh.
Teeth, thirty-six.	Teeth, thirty-four.	Teeth, thirty-four.
Lower premolars, four.	Lower premolars, three.	Lower premolars, three.
Base of canine tusk, nearly vertical.	Base of canine tusk, nearly vertical.	Base of canine tusk, horizontal.
Parietal protuberance above post-glenoid process.	Parietal protuberance above post-glenoid process.	Parietal protuberance behind post-glenoid process.
Cervical vertebræ of moderate length.	Cervical vertebræ less elongate.	Cervical vertebræ short.
Lunar articulating with trapezoid?	Lunar articulating with trapezoid.	Lunar not articulating with trapezoid.

These three genera clearly represent three stages of development of the *Dinocerata*, and these stages correspond to the successive horizons of the middle Eocene in which the remains of these animals were entombed. *Uintatherium*, the most generalized type, is found at the lowest level; *Dinoceras* is from a somewhat higher stratum; and *Tinoceras*, the most specialized of all, occurs in the latest deposits.

In the Synopsis which follows this chapter, a systematic list of all the species of the *Dinocerata* is given in detail. In connection with the preceding pages, and the Plates at the end of the volume, this will place before the reader everything of importance now known in regard to the *Dinocerata*.

APPENDIX.

SYNOPSIS OF DINOCERATA.

The present synopsis contains a list of all the known species of the *Dinocerata*, and at least one characteristic figure of each species not elsewhere illustrated in this volume. Full references, also, are given to all the important literature. The complete titles of the works cited will be found in the Bibliography, which follows this synopsis. A brief history of the discovery of each specimen of importance, with the locality, geological horizon, collector, date, the nature of the remains, and where now preserved, is likewise placed on record under each species, as an essential part of a Monograph of the group.

The dates of publication of the various papers on the *Dinocerata* have been carefully reexamined, and those here given are substantiated by conclusive evidence. The names adopted for genera and species are based on priority alone, except in the cases of those already used. For the higher groups, the new names proposed are to replace those previously applied, or to gain appropriate terms for nomenclature. *Amblydactyla* has thus been substituted for *Amblypoda*, and *Coryphodontia*, for *Pantodonta*, the names replaced being both essentially pre-occupied. The last term, moreover, has no significance when applied to the group of which *Coryphodon* is the original and characteristic type. The names *Protungulata*, *Holodactyla*, and *Clinodactyla*, express, respectively, a prominent feature of the groups they represent, and hence have been introduced in the preceding chapter.

The type specimen (number 1036) of this species was obtained in 1872 and 1873, by Messrs. B. D. Smith, J. W. Chew, and the author, from Big Bone Buttes, about twenty miles east-southeast of Fort Bridger, and twenty-five miles west of Green River, Wyoming.

¹ Δεινός, terrible, and κέρας, a horn.

This specimen consists of a skull, complete except the lower jaws, cervical and lumbar vertebræ, ribs, pelvis, limb bones, etc.

Other specimens here referred to this species are as follows:

Number 1195, collected by Mr. J. W. Chew, near Sage Creek, about twelve miles southeast of Fort Bridger, and over thirty miles west of Green River, Wyoming, and consisting of bones of the fore leg and foot.

Number 1199, collected by Mr. F. S. Wicks, in 1873, near Henry's Fork, about ten miles below Lone Tree, and twenty miles west of Green River, Wyoming, consisting of bones of the feet, etc.

Number 1200, collected by the author, in August, 1873, at the Divide near Henry's Fork, nearly twenty miles southeast of Fort Bridger, and thirty miles west of Green River, Wyoming, consisting principally of carpal bones.

Number 1206, collected by Mr. O. Harger, in 1873, from the Divide west of Henry's Fork, and consisting of a radius, ulna, femur, etc.

Number 1208, collected by Mr. J. W. Chew and Mr. B. D. Smith, in 1873, near Sage Creek, about fifteen miles southeast of Fort Bridger, and nearly thirty-five west of Green River, Wyoming, and consisting of bones of the feet, etc.

Number 1210, obtained by Mr. J. W. Chew, November, 1874, in Wyoming, and consisting of sternum, femur, patella, tibia, feet bones, etc.

Number 1211, collected by Messrs. H. G. Cheney and H. A. Oaks, in August, 1873, at Old Hat Mountain, Henry's Fork, eighteen miles southeast of Fort Bridger, and about thirty-five west of Green River, Wyoming, and consisting of a fore foot, etc.

Number 1212, obtained by Messrs. S. Smith and J. W. Chew, November, 1873, near Sage Creek, Wyoming, and consisting of lower jaws, vertebræ, humerus, etc.

Number 1215, collected by Messrs. S. Smith and J. W. Chew, in 1873, at Cattail Springs, nearly thirty miles east-southeast of Fort Bridger, and about eighteen miles west of Green River, Wyoming, and consisting of a scapula, portions of the pelvis, etc.

Number 1218, collected by Messrs. S. Smith and S. Pearson, in October, 1875, about four miles below Lone Tree, on Henry's Fork, and twenty-five miles west of Green River, Wyoming, and consisting of a large part of a skeleton, especially bones of the feet and legs.

Number 1225, collected by Mr. J. W. Chew, near Henry's Fork, about twenty-five miles west of Green River, Wyoming, consisting of portions of the skull, vertebræ, bones of the feet, etc.

Number 1226, collected in 1873, by Messrs. S. Smith, J. W. Chew, and the author, at Big Bone Buttes, Wyoming, and consisting of portions of the skull, etc.

Number 1230, collected by Mr. E. S. Lane, in August, 1873, on the Divide west of Henry's Fork, Wyoming, and consisting of carpal bones.

Number 1232, collected by Mr. J. W. Chew, in 1874, in Wyoming, consisting of parts of a pelvis, and various limb bones.

Number 1234, collected by Mr. L. Lamotte, at Camp Springs, Wyoming, in 1873, consisting of limb bones, caudal vertebræ, etc.

Number 1245, collected in 1872, by Messrs. B. D. Smith and J. W. Chew, at Big Bone Buttes, Wyoming, and consisting of a humerus, etc.

Number 1247, collected in November, 1873, by Messrs. S. Smith and J. W. Chew, at Tule Springs, near Sage Creek, Wyoming, and consisting of tarsal bones, etc.

Number 1248, collected by Mr. B. D. Smith, in 1871, at Henry's Fork, Wyoming, and consisting of axis, femur, tibia, etc.

Number 1251, collected by Mr. J. Heisey, May, 1876, eight miles south of Dug Springs, near Haystack Mountain, about sixty-five miles east of Green River, and twenty-five miles south of the Union Pacific railroad, Wyoming, and consisting of vertebræ, etc.

Number 1252, collected by Mr. S. Smith, in February, 1875, north of Leavitt's Ranch on Henry's Fork about twenty miles west of Green River, Wyoming, consisting of parts of the skull, a tibia, fibula, etc.

Number 1255, collected in June, 1874, by Mr. L. Lamotte, at Big Bone Buttes, and consisting of part of the lower jaws, showing milk incisors in position, cervical and dorsal vertebræ, ribs, and limb bones, etc.

Number 1490, collected by Mr. L. Lamotte, in Wyoming, and consisting of incisor teeth.

Number 1514, collected by Mr. J. Heisey, May, 1876, eight miles south of Dug Springs, Wyoming, and consisting of lower jaws with molars.

Number 1520, collected by Dr. J. V. A. Carter, in Wyoming, consisting of fragments of a skull, carpal bones, vertebræ, etc.

Number 1528, collected by Mr. J. W. Chew, in 1875, near Henry's Fork, Wyoming, consisting mostly of tarsal bones.

Number 1529, collected in Wyoming, by an Indian, called Shoshone John, and consisting of a considerable number of bones from several different skeletons.

Number 1548, collected by Messrs. S. Smith and J. W. Chew, in November, 1873, near Sage Creek, Wyoming, consisting of a parietal horn-core, leg bones, etc.

The geological horizon of all these specimens is in the Dinoceras, or Bridger, beds of the Middle Eocene, as shown in the section on page 7.

The remains of the specimens here described are preserved in the Museum of Yale College.

Dinoceras agreste, Marsh, *n. s.*

Woodcut: 15, p. 19.

In this species, the nasals are separated in front by a distinct suture, extending back beyond the anterior projection of the premaxillary bone. They taper to a blunt conical point, which is much roughened, but presents no certain evidence of the attachment of prenasals.

The diastema behind the upper canine is nearly straight, and of moderate length (about 7 cm.), and, in this region, the palate is strongly vaulted. The palato-maxillary foramen is opposite the first premolar.

The posterior end of the malar bone was received into a shallow pit, in front of the glenoid cavity of the squamosal.

The occiput (figure 15, page 19) has the upper angles well rounded, and presents a median tubercle in the line of the vertical ridge. The foramen magnum is broad, and rises somewhat above the level of the condyles.

The type specimen (number 1221) of this species was discovered in 1873, by Mr. L. Lamotte, near Spanish John's Meadow, about thirty miles east-southeast of Fort Bridger, and fifteen miles west of Green River, Wyoming.

This specimen consists of a skull, scapula, ribs, etc.

The geological horizon of this species is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are preserved in the Yale College Museum.

Dinoceras cuneum, Marsh, *n. s.*

Woodcuts 93, 94, p. 77; 170, 171, below.

FIG. 170.

FIGURE 170.—Nasals of *Dinoceras cuneum*, Marsh (No. 1207).

a. side view; b. top view; c. front view.

One-fifth natural size.

The skull in this species tapers in front, but, in the type-specimen (number 1042), the nasal protuberances are not well preserved. The

maxillary protuberances are well developed, divergent, and connected by a moderate ridge. The top of the skull behind this is flattened, and separated from the lateral surface by a more or less prominent ridge, rising well on the front surface of the elevated parietal processes. These processes are over the post-glenoid processes. They are high, and, toward the apex, flattened antero-posteriorly, while they expand in transverse diameter. The ridge connecting them across the surface of the skull is present, but not elevated.

The foramen magnum is slightly higher than the occipital condyles. The palate is excavated in the region of the diastema.

FIG. 171.

FIGURE 171.—Skull of *Dinoceras cuneum*, Marsh (No. 1042); seen from above.
One-eighth natural size.

Another specimen (number 1207, figure 170) has the snout very tapering in front, and the nasal protuberances small, though rather prominent. The median suture is entirely obliterated, and the prenasals, if present, are thoroughly co-ossified with each other, and with the nasal bones.

The maxillary prominences are rounded, and not very divergent. The parietal protuberances are connected by a transverse ridge. The zygomatic process of the squamosal is not excavated for the posterior end of the malar.

The type specimen (number 1042) of this species was secured in May, 1875, by Messrs. S. Smith and J. Heisey, near Haystack Mountain, about sixty-five miles east of Green River, Wyoming.

The specimen consists of a skull, with a nearly complete series of dorso-lumbar vertebræ, sacrum, pelvis, etc.

The second specimen (number 1207), consisting of portions of the skull and vertebræ, was found by J. W. Chew and the author, in 1873, near Big Bone Buttes, Wyoming.

The geological horizon is in the Bridger beds of the Middle Eocene. The only known specimens are in the Yale Museum.

Dinoceras distans, Marsh.

Woodcuts: 4, p. 13; 8, p. 15; 10, p. 16; 31, p. 29.

Marsh, Fifth Annual Report U. S. Geological Survey (figures from the present volume, viz :) fig. 41, p. 258; 45, p. 260; 66, p. 270, 1884.

The skull in the type specimen of this species (number 1235) has nearly the same general shape as in the type of *Dinoceras mirabile*, but is somewhat more robust, though pertaining to a young animal, as shown by the generally open sutures. The nasals taper in front, and bear a pair of low rounded oblique tubercles, much as in number 1036. They are terminated, as in that specimen, by flattened, nearly vertical, and deeply pitted, sutural surfaces, from which the prenasals have fallen away.

The maxillary elevations are stout and conical, and are connected across the median line of the skull by an elevated ridge. The naso-maxillary suture curves inward between the maxillary protuberances, and is strongly marked on their inner surfaces.

Behind the maxillary protuberances, the top of the skull is flattened, and presents two low oblique ridges, converging behind, along the lines of the fronto-nasal sutures. At the sides, the superior surface is separated from the lateral by a ridge, which rises nearly to the top of the parietal protuberances. These are well developed, triangular in section, and directed upward and outward, and are situated above the post-glenoid processes. The foramen magnum is below the upper margin of the occipital condyles.

In the type specimen, the post-glenoid process is robust. The zygomatic process of the squamosal is deeply excavated in front of the glenoid cavity, for the posterior end of the malar bone, which is peculiarly blunt, and rounded behind. The palato-maxillary foramen is rounded, and placed opposite the posterior half of the first premolar.

The cavity for the brain is exposed in this specimen, and shows a nasal septum just in front of the anterior constriction. The short olfactory lobes were bounded in front by thin cribriform plates.

The young specimen (number 1601) agrees with the type (number 1235) in the general shape of the skull, in the form of the maxillary protuberances and connecting ridge, in the shape and position of the parietal protuberances, and in the position of the palato-maxillary foramen. Also in the deep excavation for the end of the malar bone. The known differences may be attributed to age.

The type of this species (number 1235) was collected by Mr. S. Smith, in 1874, near Lone Tree, on Henry's Fork, Wyoming.

The second specimen (number 1601) was found by Mr. Smith in 1882, near Haystack Mountain, Wyoming.

The geological horizon of this species is in the *Dinoceras* beds.

The type specimen of this species is preserved in the Yale Museum.

Dinoceras laticeps, Marsh.

(Plates X-XIV, XLIII.)

Woodcuts: 14, p. 19; 22, p. 25; 27, p. 26; 33, p. 30; 47, p. 43; 50, p. 44; 57, 58, p. 54; and 112, p. 103; 136, p. 138; 139, 140, p. 149.

Marsh, American Journal of Science and Arts (3), Vol. VI, p. 301, October, 1873; Vol. XI, p. 164, Plate V, February, 1876.

Osborn and Speir (*Uintatherium laticeps*).—American Journal of Science and Arts (3), Vol. XVII, pp. 304, 305, 307, April, 1879.

The type of this species possesses the main characters of *Dinoceras*, but, in the premaxillaries, palate, and brain-cavity, shows an approach to *Tinoceras*, especially *Tinoceras pugnax*. It apparently represents a sub-genus of *Dinoceras*, which may be called *Paroceras*.

The type specimen of this species (number 1039) was obtained in August, 1873, by Mr. L. Lamotte and the author, near Spanish John's Meadow, Wyoming.

This specimen consists of a skull, lower jaws, vertebræ, etc.

A second specimen, a female (number 1202), consisting of a skull and other parts of the skeleton, was found by the author, in August, 1873, near Henry's Fork, about thirty miles west of Green River, Wyoming. Additional specimens are numbers 1197, 1222, 1239, and 1264.

The geological horizon of this species is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are in Yale College Museum.

Dinoceras lucare, Marsh.

(Plate IX.)

Woodcuts: 46, p. 43; 103, 104, 105, p. 84; 110, p. 98; 172, 173, below.

Marsh, American Journal of Science and Arts (3), Vol. V, p. 408, May, 1873.

Fifth Annual Report of the U. S. Geol. Survey, (figures from the present volume, viz:)

fig. 83, p. 279; 124, 125, p. 296, 1884.

Leidy (Uintatherium).—Extinct Vertebrate Fauna, p. 334, 1873.

The type specimen of this species (number 1038) was obtained by Messrs. B. D. Smith, J. W. Chew and the author, two miles east of Big Bone Buttes, Wyoming, September, 1872, and September, 1873.

This specimen consists of a skull, and numerous parts of the skeleton.

The geological horizon of this species is in the Bridger Beds of the Middle Eocene.

The remains of this specimen are preserved in Yale College Museum.

Dinoceras reflexum*, Marsh, *n. s.

Woodcut : 174, below.

FIG. 174.

FIGURE 174.—Nasals of *Dinoceras reflexum*, Marsh (No. 1229).

a. side view; b. top view; c. front view.

One-fifth natural size.

In the type of this species (number 1229), the nasal protuberances are small, but prominent, and are directed strongly upward. The nasal bones are completely united to the end, but are there terminated by sutural surfaces, looking nearly downward, and indicating the position of the prenasal bones, which have fallen away. The suture between the nasal and the premaxillary is evident, behind and below the nasal protuberance.

The post-glenoid process is large and strong, and the zygomatic process of the squamosal presents a pit for the end of the malar bone just in front of the glenoid cavity. The occipital crest shows a median keel on its posterior surface.

A cervical centrum, from which the epiphyses have nearly separated, shows that these vertebræ were proportionally shorter than in number 1255. The vertical diameter is to the longitudinal as 1 to .55, while in number 1255 these dimensions are about as 1 to .6.

A pyramidal bone, accompanying these specimens, has the face for the fifth metacarpal confluent with that for the unciform, as in figures 117 and 118, page 108, instead of distinct, as on Plate XXXII, figure 6.

The specimen (number 1229) upon which the species is based was collected in October, 1873, by Messrs. J. W. Chew and S. Smith, at Tule Springs, Wyoming.

This specimen consists of fragments of the skull, limb bones, etc.

The geological horizon of this species is in the Bridger beds of the Middle Eocene.

The known remains are preserved in Yale College Museum.

TINOCERAS,¹ Marsh, 1872.

Tinoceras anceps, Marsh.

Woodcuts: 97, 98, p. 80; 175, 176, 177, below.

FIG. 175.

FIGURE 175.—Nasals of *Tinoceras anceps*, Marsh (No. 1266).

a. side view; b. top view; c. front view.

One-fifth natural size.

 FIGURE 177.—The same specimen; front view.
 a. anterior crest; b. posterior crest.

Both figures are one-half natural size.

Marsh, American Naturalist, Vol. VII, p. 52, January, 1873; pp. 147, 152, March, 1873; p. 218, April, 1873; Vol. VII, Appendix, p. viii, June, 1873.
 Proceedings of the American Philosophical Society, Vol. XII, p. 578, for 1872, 1873; Vol. XIII, p. 256, 1873.
 Cope (*Uintatherium anceps*.)—Proceedings of the American Philosophical Society, Vol. XIII, p. 61, 1873.

The type specimen of this species was of small size, and evidently a female. The occiput is elevated, and has a median vertical ridge. The lateral crests extend from the front nearly to the summit of the parietal protuberances. The latter are connected by a strong ridge passing directly over the brain-cavity. The post-glenoid processes are triangular in horizontal section, with the apex outward.

A second specimen (number 1266) has the nasal protuberances of moderate size, and resembling those of *Tinoceras grande*. The prenasal bones are firmly co-ossified with the nasals.

The type specimen (number 1030) was discovered by Lieut. W. N. Wann, in September, 1870, on the Divide near Sage Creek, fifteen miles southeast of Fort Bridger, Wyoming.

The remains of this specimen consist of portions of the skull, cervical and dorsal vertebræ, and a tibia.

The second specimen (number 1266) was found by Messrs. J. W. Chew and L. Lamotte, in August, 1874, in Wyoming. It consists of portions of a skull, and a few other bones.

The geological horizon of this species is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are preserved in the Yale College Museum.

Tinoceras affine*, Marsh, *n. s.

Woodcuts: 16, p. 19; and 178, 179, below.

FIG. 178.

FIG. 179.

FIGURE 178.—Vertical section through cranium of *Tinoceras affine*, Marsh (No. 1574).

FIGURE 179.—The same specimen; seen from above.

ps. parietal supra-occipital suture; *fp.* fronto-parietal suture; *o.* occipital condyle; *ol.* olfactory lobes of brain; *p'.* parietal protuberance; *s.* supra-occipital crest.

Both figures are one-eighth natural size.

In the type of this species (number 1574), the snout tapers, and the nasals are divided by a distinct median suture.

The nasals are well preserved, and much resemble those of number 1041, but are more perfect. As in number 1040, they are thoroughly co-ossified to the extreme point, which is directed obliquely downward. The nasal protuberances are placed obliquely, and are flattened on their outer anterior surface. They are directed outward and upward, and are elongate-oval in section, the long axes of the ovals making about a right angle with each other in front of the snout.

The maxillary protuberances are elevated, but of moderate size, and are connected across by a rounded ridge. The parietal protuberances present a moderately sharp ridge on their anterior faces, and are somewhat club-shaped. They were connected across the top of the skull by a rounded ridge.

The foramen magnum is transversely oval, and rises nearly to the same height as the occipital condyles. The post-glenoid process is robust.

The occipital crest bears a rather prominent, but rounded, ridge along the median line, above the foramen magnum.

The palate is moderately excavated in front, and the palato-maxillary foramen is opposite the first premolar. The diastema is thick, strong, short, and straight. The vomer is preserved in this specimen, firmly lodged in a groove in the upper surface of the maxillaries.

The face on the zygomatic process of the squamosal for the malar is broad and flat, and does not end in a pit, for the posterior end of the malar bone.

In this species, the brain occupies a very oblique position in the skull, as shown in the accompanying woodcut, figure 178. In the section of the cranium, the sutures defining the anterior and posterior limits of the parietal bones along the median plane of the skull are clearly shown. The fronto-parietal suture also (figure 178) is apparent on the superior surface of the skull, above the anterior part of the cavity for the cerebral hemispheres, as in *Dinoceras distans* (number 1601). The suture limiting the parietal posteriorly is evident in the same section. It is behind the cerebral cavity, but cannot be traced with certainty on the upper surface of the skull.

The type specimen (number 1574) of this species was obtained by Mr. J. Heisey, eight miles south of Dug Springs, Wyoming, in 1876.

This specimen consists of a skull, etc.

The geological horizon is in the *Dinoceras* beds of the Middle Eocene.

The only known remains of this specimen are in Yale College Museum.

***Tinoceras annectens*, Marsh.**

Woodcuts: 6, p. 13; 21, p. 21; 36, 37, p. 36.

Marsh, Fifth Annual Report U. S. Geological Survey, (figures from the present volume, viz:) fig. 43, p. 258; fig. 56, p. 264; fig. 73, 74, p. 274, 1884.

The skull in the type of this species (number 1043) agrees generally in size and form, as far as preserved, with that of *Tinoceras ingens*, (number 1041). The canine tusk runs somewhat forward in number 1043, and the premaxillaries appear less robust. The palato-maxillary foramen is near the front premolar, not well in front of it, as in *Tinoceras ingens*. The upper canine (page 21, figure 21) has, on its outer side, a large, somewhat heart-shaped, worn surface.

The lower jaw in this species is slender, and bears a well developed process running downward and forward, and terminating in an oblique, nearly straight margin. The coronoid process is pointed.

The first dorsal in this specimen is proportionally shorter than in *Tinoceras anceps*, with the lateral faces for its ribs more approximate. The length of the floor of the neural canal is to the length of the under surface of the centrum as 3 to 4, and a similar proportion in the adjoining vertebra indicates an upward curvature in the neck at this point.

The type of this species (number 1043) was found by Mr. J. Heisey, in May, 1874, near Haystack Mountain, Wyoming.

The remains consist of a skull, and other portions of the skeleton.

The geological horizon is in the Bridger beds of the Middle Eocene.

The only known specimen of this species is in the Yale College Museum.

***Tinoceras cornutum*, Cope, sp.**

Woodcuts: 180, 181, below.

FIG. 180.

FIGURE 180.—Skull of *Tinoceras cornutum*, Cope, sp.; side view.

This figure and the following were photographed on wood from Prof. Cope's original photographs, for which the author is indebted to the late Prof. Louis Agassiz. These photographs, although both marked $\frac{1}{6}$, are not of the same size. The present figures are copies, both reduced in the same proportion. The white portion at the base of the tusk is plaster, and the tooth is thus made to appear longer than in nature. The tusk itself belongs on the other side.

FIG. 181.

FIGURE 181.—Skull of *Tinoceras cornutum*, Cope, sp.; seen from below.
Both figures are about one-eighth natural size.

 Proceedings of the American Philosophical Society, Vol. XIII, p. 255, 1873.

In the restoration of this species as given by Professor Cope in the American Naturalist, Vol. XVI, Plate XVII, the skull used is the male one here figured, with the tusk much elongated. The lower jaw below it belonged to a female, possibly of another genus. The scapula, as restored, is unlike that of any of the known Dinocerata, and the entire fore limb is in a position anatomically impossible.

The type of the present species was obtained by Prof. E. D. Cope and Mr. S. Smith, in August, 1872, at Haystack Mountain, Wyoming.

The remains consist of portions of a skull, and other parts of the skeleton.

The skull as here figured is in the collection of Prof. Cope. Some other portions of the same skull and skeleton, subsequently collected by Mr. S. Smith, are in the Yale Museum.

***Tinoceras crassifrons*, Marsh.**

Woodcuts: 30, p. 29; and 182, below.

FIGURE 182.—Nasals of *Tinoceras crassifrons*, Marsh (No. 1236).
a. side view; b. top view; c. front view.

One-fifth natural size.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figure from the present volume, viz:) fig. 65, p. 270, 1884.

The nasals in the type of this species (number 1236) bear small, but prominent, tubercles, directed well upward and outward, and placed well back. In front of these elevations, the nasals are produced, and terminated by oblique, but nearly vertical, sutural surfaces for the pre-nasals.

The maxillary protuberances are high and prominent, and connected by a transverse, elevated, and sharp, ridge.

The upper surface of the skull is flattened, and well separated from the lateral surfaces by a ridge, gradually rising into the parietal protuberances. These protuberances are connected by a distinct transverse ridge, and are elevated, and, in section, somewhat triangular.

The olfactory lobes of the brain were short, and the olfactory chambers were not divided by a transverse bony septum.

The type specimen (number 1236) of this species was collected by Messrs. L. Lamotte and J. W. Chew, at Cattail Springs, about twenty-five miles southeast from Fort Bridger, and about eighteen miles west of Green River, Wyoming, July, 1874.

The remains of this specimen consist of various portions of a skull.
The geological horizon is in the Dinoceras beds of the Middle Eocene.
The known remains of this species are in the Museum at Yale College.

(*Loxolophodon cornutus*).—Hayden's Report U. S. Geological Survey for 1872, p. 575, 1873.

The type specimen (number 1040) of this species was collected at Barrel Springs, about seventy-five miles east of Green River, Wyoming, in 1872, by Messrs. J. W. Chew and B. D. Smith.

The remains of this specimen consist of portions of the skull, and cervical vertebræ.

The geological horizon of this species is in the Middle Eocene, in the *Dinoceras* beds.

The known remains are preserved in Yale College Museum.

Tinoceras hians, Marsh.

Woodcuts: 32, p. 30; and 186, below.

FIG. 186.

FIGURE 186.—Nasals of *Tinoceras hians*, Marsh (No. 1499).

a. side view; b. top view; c. front view.

One-fifth natural size

Marsh, Fifth Annual Report of the U. S. Geological Survey (figure from the present volume), fig. 67, p. 271, 1884.

The snout in the type of this species (number 1499) tapers in front, where the nasals are divided by persistent sutures, and bear low rounded tubercles. The maxillary protuberances are connected by a low rounded ridge. The upper surface of the skull behind these protuberances is flattened, and, in the region of the fronto-nasal sutures, elevated. It is separated from the lateral surface by a ridge, rising gradually upon the parietal protuberances, which are connected by a transverse elevation across the skull, above the brain case.

The olfactory chambers were divided transversely by a bony septum as shown in figure 32, page 30.

The palato-maxillary foramen extends back nearly to the middle of the second premolar. The premaxillaries are proportionally larger than in *Dinoceras laticeps* (number 1039), and straighter than in *Dinoceras mirabile* (number 1036). They present pits, as if for rudimentary teeth, as in number 1039.

This species is based upon a specimen (number 1499) collected in June, 1874, by Mr. L. Lamotte, at Cattail Springs, Wyoming.

The remains of this specimen consist of a skull, vertebræ, etc.

The geological horizon is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are preserved in the Museum of Yale College.

***Tinoceras ingens*, Marsh.**

(Plates XV-XVIII, LVI.)

Woodcuts: 9, p. 16; 17, p. 19; 23, p. 25; 28, p. 27; 51, p. 45; 59, p. 55; 115, 116, p. 105; 117, p. 108; 124, p. 119; 134, 135, p. 136; 141, 142, p. 149.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figures from the present volume, viz:) figs. 46, p. 261; 52, p. 263; 58, p. 267; 63, p. 269; 88, p. 281; 96, 97, p. 286; 126, 127, p. 297; 137, p. 302, 1884.

The type specimen (number 1041) of this species was collected by Mr. S. Smith, near Haystack Mountain, Wyoming, in May, 1875.

This specimen consists of a skull, in excellent preservation.

The geological horizon of this species is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are in Yale College Museum.

Tinoceras jugum, Marsh.

Woodcut: 187, below.

FIG. 187.

FIGURE 187.—Nasals of *Tinoceras jugum*, Marsh (No. 1500).
a. side view; b. top view; c. front view.

One-fifth natural size.

In this species, the snout tapers forward, and bears a pair of small flattened tubercles, directed well outward and forward. The nasals are thoroughly coössified, and project in front beyond the tubercles. The maxillary protuberances are high, and strongly divergent. They are connected by a high sharp ridge, which suggested the specific name.

The type of this species (number 1500) was found by Mr. L. Lamotte, in September, 1874, in Wyoming.

The specimen consists of portions of the skull, and fore limbs.

The geological horizon is in the Bridger beds of the Middle Eocene.

The only remains known are in the Yale Museum.

Tinoceras lacustre, Marsh.

Woodcut: 188, below.

FIG. 188.

FIGURE 188.—Upper molars of *Tinoceras lacustre*, Marsh (No. 1037); seen from below.
m. first true molar; pm. first premolar.

Three-fourths natural size.

Marsh (*Dinoceras lacustris*).—American Journal of Science and Arts (3), Vol. IV, p. 344, October, 1872.

Proceedings of the American Philosophical Society, Vol. XIII, p. 256, 1873.

Cope (*Uintatherium lacustre*).—Hayden's Report U. S. Geological Survey for 1872, pp. 581, 584, 1873.

Proceedings of the American Philosophical Society, Vol. XIII, pp. 61, 66, 1873.

The type specimen (number 1037) of this species was discovered by Messrs. J. W. Chew and B. D. Smith, near Bitter Creek, Wyoming, in 1872.

This specimen consists of upper premolars, molars, and a radius.

The geological horizon is in the Bridger beds of the Middle Eocene.

The known remains of this species are preserved in the Museum of Yale College.

Tinoceras latum*, Marsh, *n. s.

Woodcuts: 189 and 190, below.

FIG. 189.

FIGURE 189.—Nasals of *Tinoceras latum*, Marsh (No. 1242).
a. side view; b. top view; c. front view.

One-fifth natural size.

FIG. 190.

FIGURE 190.—Nasals of *Tinoceras latum*, Marsh (No. 1533).
a. side view; b. top view; c. front view.

One-fifth natural size.

The snout in the type specimen of this species tapers toward the end, but bears a pair of low rounded tubercles, directed nearly forward, and only slightly outward or upward. They are separated in front, along the median line, by an open suture between the nasal bones. These project forward beyond the protuberances, and terminate differently on the two sides, the left coming nearly to a point, while the right is a little shorter, and ends with an oblique sutural surface.

The skull presents a transverse ridge above the brain cavity, uniting the parietal protuberances.

The teeth preserved are but little worn, indicating a fully adult, but not old, animal.

Another specimen (number 1533) referred to this species is quite unlike any other in the collection in the form of the nasal bones so far as preserved, but, unfortunately, the specimen is considerably eroded. The snout, instead of tapering, expands forward, and presents on each side a broadly rounded, horizontal protuberance, scarcely rising at all above the general level of the nasal bones. They, also, project forward, far beyond the end of those bones, which were thoroughly consolidated, and directed somewhat downward, underneath the broad shelving protuberances.

The left maxillary protuberance preserved with this specimen is of large size, and flattened on its outer side.

This species, with *Tinoceras cornutum*, forms a distinct sub-genus of *Tinoceras*, which may be called *Platoceras*.

The type of this species (number 1242) was obtained in September, 1873, by Mr. L. Lamotte and the author, near Spanish John's Meadow, Wyoming.

The remains of this specimen consist of portions of the skull, and teeth.

A second specimen (number 1533), apparently a very old individual of the same species, was found in May, 1875, by Messrs. S. Smith and S. Pearson, at Haystack Mountain, Wyoming.

This specimen consists of portions of the skull. The extremity of the nasal bones is figured above.

The geological horizon of these specimens is in the Bridger beds.

The known remains of this species are preserved in Yale College Museum.

***Tinoceras longiceps*, Marsh.**

Woodcuts: 38, p. 37; 48, p. 43; and 191, 192, below.

FIG. 191.

FIG. 192.

FIGURE 191.—Left maxillary protuberance of *Tinoceras longiceps*, Marsh (No. 1256, female); side view.

FIGURE 192.—Left parietal protuberance of same skull; side view.

The dotted line shows the outline of the cavities (*a* and *b*) at the base of each specimen.

Both figures are one-fourth natural size.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figures from the present volume, viz:) fig. 75, p. 275; 85, p. 279, 1884.

The skull in this species presents some striking peculiarities. The maxillary protuberances are placed well back, and are much above the socket for the weak and slender canine tooth (figure 48, page 43). They are directed upward and outward, and are greatly excavated within, and below, as shown in figure 191. The parietal protuberances are well developed, and are also excavated near the base. The anterior face, as far as preserved, shows no distinct indication of a sharp ridge rising on the frontal bone in front of the protuberance, as in *Dinoceras laticeps* (number 1202), but the parietal protuberances seem to have risen abruptly, as in *Tinoceras ingens*. They are flattened behind, but are scarcely expanded transversely, as in the males of this type. The zygomatic process of the squamosal is slender, and presents a decided pit for the posterior end of the malar, just in front of the glenoid cavity.

The lower jaw (figure 38, page 37) is elongated, and presents a small and weak pendent process, for the protection of the small and slender canine tusk (figure 48, page 43). This tusk has a nearly straight root, which suddenly contracts at the apex into a small orifice. The position of its socket is well in front of, and below, the maxillary horn-core, and unlike that of any other specimen in the Museum.

This species is based upon a specimen (number 1256, female) obtained by Mr. J. Heisey, at Red Dog Buttes, Wyoming, in June, 1876.

The remains of the type of this species consist of portions of the skull, lower jaws, etc.

The geological horizon is in the *Dinoceras* beds of the Middle Eocene. The known remains of this species are in Yale College Museum.

***Tinoceras pugnax*, Marsh.**

(Plate XIX.)

Woodcuts: 5, p. 13; 18, p. 19; 19, p. 21; 24, p. 25; 29, p. 27; 52, p. 45; 67, p. 63.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figures from the present volume, viz:) fig. 42, p. 258; 53, p. 263; 54, p. 264; 59, p. 267; 64, p. 269; 89, p. 282; 104, p. 290, 1884.

The type specimen of this species (number 1044) was an individual of moderate size, and a male. The skull is short, and, seen from above strongly wedge-shaped. The nasal protuberances are small, high, and widely separated. The maxillary elevations are somewhat in front of the diastema. They are robust and recurved. The parietal protuberances are of moderate height, and transversely compressed at their summits. The premaxillaries are widely separated in front. The palato-maxillary foramen is opposite the second premolar. The posterior nares open upward through oval apertures, but little behind the bony palate. The

palate is much expanded between the canine tusks. The lower jaw has the alveoles of the incisors and canines nearly vertical. The flange for protection of the tusk is long, and rounded in front (Plate XIX, figure 1).

This specimen represents a distinct sub-genus of *Tinoceras*, which may be called *Laoceras*.

The type specimen (number 1044) of this species was found by Mr. S. Smith, May, 1875, at Haystack Mountain, Wyoming.

This specimen consists of a skull in good condition, and various other bones of the same individual.

The geological horizon of this specimen is in the Dinoceras beds.

The known remains of this species are preserved in the Museum of Yale College.

***Tinoceras Speirianum*, Osborn, sp.**

Woodcut: 193, below.

FIG. 193.

FIGURE 193.—Skull of *Tinoceras Speirianum*, side view (after Osborn).
One-eighth natural size.

Osborn (*Loxolophodon Speirianum*).—Memoir upon *Loxolophodon* and *Uintatherium*, pp. 18, 20, 21, 22, 24, 41, 44, Plate I, 1881.

This figure was photographed on wood from the lithographic plate cited above. The restorations of this skull do not allow some of its important features to be determined, but the generic characters are distinct.

In the restoration of this species, as given in the work cited above, the skull belonged to a male, and the lower jaw to a female. The bones of the fore limb, also, are in a position impossible in life.

The type specimen of this species was discovered by Mr. Francis Speir, in 1878, in Wyoming.

This specimen consists of the skull here figured.

The geological horizon is in the Bridger beds of the Middle Eocene.

The known remains of this species are in the Princeton Museum.

***Tinoceras stenops*, Marsh.**

Woodcuts: 53, 54, p. 47; and 194, below.

FIG. 194.

FIGURE 194.—Skull and lower jaw of *Tinoceras stenops*, Marsh (No. 1567).

c. condyle of lower jaw; d. diastema; m'. maxillary protuberance; n'. nasal protuberance; o. occipital condyle; p'. parietal protuberance; pm. premaxillary bone.

One-eighth natural size.

Marsh, Fifth Annual Report of the U. S. Geological Survey (figures from the present volume, viz:) figs. 90, 91, p. 283, 1884.

The skull in the type specimen of this species (number 1567) is narrow, and elongated. The nasal protuberances are flat below, and above. They appear to have been divergent, but of moderate size, though situated well forward. The maxillary protuberances were prominent, directed well forward, and connected by a transverse ridge. Behind them, on each side, stands a prominent protuberance over the orbit. Back of this, the superior and lateral surfaces of the skull pass into each other by regular curvature in front of the origin of the lateral ridges, which rise abruptly upon the parietal protuberances. These elevations are imperfectly preserved, but are flattened in front, and situated behind the post-glenoid processes.

The palate is excavated in the region of the diastema, and the palato-maxillary foramen is just in front of the first premolar, but not so far in front as in *Tinoceras ingens* (number 1041).

The lower jaw is slender, and expands rapidly in the region of the symphysis for the formation of the flanges protecting the canine tusks. When seen from above, the angle at which the rami meet at the symphysis is distinctly rounded in front, though somewhat less strongly than in *Dinoceras laticeps* (Plate XII, figure 1).

The type specimen (number 1567) of this species was collected by Mr. S. Smith, at Haystack Mountain, Wyoming, in May, 1882.

The remains of this specimen consist of a skull, with lower jaw, etc.

The geological horizon of this species is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are in the Yale College Museum.

***Tinoceras vagans*, Marsh.**

Woodcut: 12, p. 17.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figure from the present volume, viz:) fig. 49, p. 262, 1884.

The snout in the type of this species (number 1241) tapers somewhat in front, and the nasal protuberances are flattened and directed forward, outward, and upward. The nasal bones are united throughout. The maxillary protuberances are slender, but prominent, and united across by a low rounded ridge. The upper surface of the skull is separated from the lateral surface, above and behind the orbits, by a ridge, which rises upon the parietal protuberances. These are prominent, and are flattened antero-posteriorly. They were connected across the top of the skull by a low transverse elevation.

The type specimen (number 1241) of this species was discovered by Mr. S. Pearson, at Red Dog Buttes, Wyoming, in July, 1875.

This specimen consists of portions of the skull, etc.

The geological horizon is in the *Dinoceras* beds of the Middle Eocene.

The known remains of this species are preserved in the Yale Museum.

UINTATHERIUM,¹ Leidy, 1872.**Uintatherium robustum, Leidy.**

Woodcuts: 61, 62, p. 57; and 195, below.

FIG. 195.

 American Naturalist, Vol. XV, p. 75, January, 1881; Vol. XVIII, p. 1115, fig. 7, November, 1884.

The type specimen of this species was collected by Mr. J. L. Wortman, in 1880, in the Wind River Basin, Wyoming.

This specimen consists of portions of the lower jaws here figured.

The geological horizon of this species is not known with certainty, but is apparently in the Bridger beds of the Eocene.

The type specimen is preserved in Prof. Cope's collection.

Uintatherium latifrons, Marsh.

Woodcuts: 11, p. 17; 125, 126, 127, 128, p. 130.

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figure from the present volume, viz:) fig. 48, p. 262, 1884.

In this species, the snout tapers in front, where the nasals are divided by an open suture. The nasal protuberances are of moderate size, broadly oval at the base, approximate, and moderately divergent. The nasals project well forward beyond them. The maxillary protuberances are large, and rounded, and are connected by a very low transverse

ridge. The parietal protuberances were robust, and broadly oval in section near the top, and are connected by a low transverse ridge across the top of the skull. All these protuberances in this specimen are smooth, and regularly rounded.

The type specimen (number 1231) upon which this species is based was collected by Mr. J. W. Chew, in 1874, two miles from Big Bone Buttes, Wyoming.

The remains of this specimen consist of a skull, etc.

The geological horizon of this species is in the Dinoceras beds of the Middle Eocene.

The known remains of this species are preserved in Yale College Museum.

Uintatherium Leidianum, Osborn, Scott, and Speir.

Woodcut: 198, below.

FIGURE 200.—The same specimen; seen from in front.

m'. maxillary protuberance; *n*. nasal bone.

Both figures are one-fourth natural size

Marsh, Fifth Annual Report of the U. S. Geological Survey, (figures from the present volume, viz:) figs. 78, 79, p. 276, 1884.

The maxillary protuberances of the skull of this specimen are peculiar for their robust form. They are connected by a well developed transverse ridge. The parietal protuberances are massive, and somewhat club-shaped, and present a ridge in front, as in *Dinoceras mirabile* and *Tinoceras ingens*, evidently formed by the frontal bone rising nearly to the top of the protuberances.

The type specimen (number 1194) of this species was collected by Messrs. S. Smith and J. W. Chew, east of Fort Bridger, Wyoming, in October, 1873.

The remains of this species consist of a lower jaw, and other parts of the skeleton.

The geological horizon of this species is in the Dinoceras beds of the Middle Eocene.

The known remains of this species are preserved in Yale College Museum.

BIBLIOGRAPHY.

1871.

Marsh, Othniel Charles.—Notice of some New Fossil Mammals from the Tertiary Formation.—American Journal of Science and Arts (3), Vol. II, pp. 35-44. New Haven, July, 1871.

First species of *Dinocerata* described (*Titanotherium? anceps*). *Titanotherium* was the first generic name applied to any of the *Dinocerata*. It was then a synonym of *Menodus*, but having been once used in another group, it cannot be retained for any genus of the *Dinocerata*. The same well known rule excludes the name *Loxolophodon*, which was first given to a species of *Coryphodon*.

1872.

Marsh, Othniel Charles.—Preliminary Description of New Tertiary Mammals; Part I.—American Journal of Science and Arts (3), Vol. IV, pp. 122-128. New Haven, August, 1872.

The same, published in advance, July 22, 1872.

Abstract of same.—Neues Jahrbuch für Mineralogie, etc., pp. 990, 991, Stuttgart, 1872.

Leidy, Joseph.—On some New Species of Fossil Mammalia from Wyoming. Proceedings of the Academy of Natural Sciences, Vol. XXIV, pp. 167-169. Philadelphia, September, 1872.

The same, published in advance, August 1, 1872.

The same, American Journal of Science and Arts (3), Vol. IV, pp. 239, 240. New Haven, September, 1872.

First description of *Uintatherium robustum*.

Marsh, Othniel Charles.—Preliminary Description of New Tertiary Mammals; Parts I, II, III, and IV (from American Journal of Science and Arts, August and September, 1872), with Postscript and Errata, pp. 1-35; published in advance, August 19, 1872.

The genus *Tinoceras* proposed.

Marsh, Othniel Charles.—Note on *Tinoceras anceps*.—American Journal of Science and Arts (3), Vol. IV, p. 322. New Haven, October, 1872.

The same, published in advance August 24, 1872.

Abstract of same.—Popular Science Review, p. 94, London, January, 1873.

Marsh, Othniel Charles.—Errata.—American Journal of Science and Arts (3), Vol. IV, fourth page of cover, September, 1872. The same, p. 504. New Haven, December, 1872.

Marsh, Othniel Charles.—Notice of a new Species of *Tinoceras*.—American Journal of Science and Arts (3), Vol. IV, p. 323. New Haven, October, 1873.

The same, published in advance, September 21, 1872.

Description of *Tinoceras grande*, and family *Tinoceratidae* proposed.

Marsh, Othniel Charles.—Notice of some Remarkable Fossil Mammals.—American Journal of Science and Arts (3), Vol. IV, pp. 343, 344. New Haven, October, 1872.

The same, published in advance, September 27, 1872.

Dinoceras mirabile and *D. lacustre* first described, and the order *Dinocerata* proposed.

Cope, Edward Drinker.—Notices of New Vertebrata from the Upper Waters of Bitter Creek, Wyoming Territory.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, pp. 483-486. Philadelphia, February, 1873.*

The same, published in advance. Philadelphia, 1872.

* The authority for the date here assigned to this number of the Proceedings is the written statement of Prof. J. P. Lesley, Secretary of the Society, who then had charge of its publications.

Cope, Edward Drinker.—Second Notice of Extinct Vertebrates from Bitter Creek, Wyoming.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, pp. 487, 488. Philadelphia, February, 1873.

The same, published in advance, 1872.

Description of specimens named *Loxolophodon cornutus*, *L. furcatus*, and *L. pressicornis*. (See note on page 225 of the present volume.)

Cope, Edward Drinker.—Notice of Proboscidiæ from the Eocene of Southern Wyoming.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, p. 580. Philadelphia, February, 1873.

The same, with errors, Telegram from Black Buttes, Wyoming, published in advance, 1872.

The same, Palæontological Bulletin, No. 5, re-published, Philadelphia, 1873.

Cope, Edward Drinker.—The Proboscidiæ of the American Eocene.—American Naturalist, Vol. VI, pp. 773, 774. Salem, December, 1872.

Leidy, Joseph.—Remarks on Fossil Mammals from Wyoming.—Proceedings of the Academy of Natural Sciences, Vol. XXIV, pp. 240-242. Philadelphia, December, 1872.

1873.

Marsh, Othniel Charles.—On some of Professor Cope's Recent Investigations.—American Naturalist, Vol. VII, pp. 51, 52. Salem, January, 1873.

Cope, Edward Drinker.—Proboscidiæ of the American Eocene, Correction.—American Naturalist, Vol. VII, p. 49. Salem, January, 1873.

Marsh, Othniel Charles.—On the Gigantic Fossil Mammals of the Order Dinocerata.—American Journal of Science and Arts (3), Vol. V, pp. 117-122, Plates I, II. New Haven, February, 1873.

The same, published in advance, January 28, 1873.

A general description of the *Dinocerata*, with figures of the skull of *Dinoceras*, and corrections of errors in Prof. Cope's publications on the same subject.

Abstract of same.—Zeitschrift für die Gesammten Naturwissenschaften, vol. vi, pp. 533, 534, Berlin, December, 1872.

The same.—Annales des Sciences Naturelles (Zoologie), vol. xvii, pp. 1-8, Paris, 1873.

The same.—Journal de Zoologie, vol. ii, pp. 160-168, Paris, 1873.

Abstract of same.—Geological Magazine, vol. x, pp. 115, 116, London, March, 1873.

Abstract of same, with figure of skull of *Dinoceras mirabilis*.—Nature, vol. vii, 366, London, March 13, 1873.

Abstract of same.—Popular Science Review, p. 213, London, April, 1873.

Abstract of same.—Neues Jahrbuch für Mineralogie, etc., pp. 334, 335, Stuttgart, 1875.

Cope, Edward Drinker.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, p. 515. Philadelphia, February, 1873.

Cope, Edward Drinker.—On the Dentition of Metalophodon.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, pp. 542-545. Philadelphia, February, 1873.

The name *Loxolophodon* stated to be a synonym of *Bathmodon*.

Marsh, Othniel Charles.—Communication on the Discovery of New Rocky Mountain Fossils.—Proceedings of the American Philosophical Society, Vol. XII, number 89, for 1872, pp. 578, 579. Philadelphia, February, 1873.

A general statement of the characters of the *Dinocerata*.

The same.—*Annales des Sciences Géologiques*, vol. iii, pp. 99, 100, Paris, March, 1873.

Cope, Edward Drinker.—On the Short Footed Ungulata of Wyoming.—Proceedings of the American Philosophical Society, Vol. XIII, number 90, for 1873, pp. 38-74, Plates I-IV. Philadelphia, 1873.

The same, published in advance, March, 1873.

Dinocerata considered a suborder of Proboscidea, with a list of species.

Cope, Edward Drinker.—Observations on the Structure and Systematic Position of the genus *Eobasileus*, Cope.—Proceedings of the Academy of Natural Sciences, Vol. XXV, pp. 10-12. Philadelphia, March, 1873.

The same, with changes, published in advance, 1873.

Eobasileus and allied genera referred to the Proboscidea.

Cope, Edward Drinker.—On the New Perissodactyles from the Bridger Eocene.—Proceedings of the American Philosophical Society, Vol. XIII, number 90, for 1873, pp. 35, 36. Philadelphia, 1873.

The same, under the title—On Two New Perissodactyles from the Bridger Eocene.—*Palæontological Bulletin* No. 11. Philadelphia, 1873.

Marsh, Othniel Charles.—Note on the Dates of some of Professor Cope's recent Papers.—*American Journal of Science and Arts* (3), Vol. V, pp. 235, 236. New Haven, March, 1873.

Errors corrected in the dates of the Philosophical Society's meetings at which Prof. Cope's papers were claimed to have been read.

The same, *American Naturalist*, Vol. VII, p. 173. Salem, March, 1873.

Marsh, Othniel Charles.—The Fossil Mammals of the order Dinocerata.—American Naturalist, Vol. VII, pp. 146–153; Plates I–II. Salem, March, 1873.

Characters of the order *Dinocerata*, with list of errors in Prof. Cope's papers on the same subject, and figures of skull of *Dinoceras mirabile*.

Cope, Edward Drinker.—The Gigantic Mammals of the Genus Eobasileus.—American Naturalist, Vol. VII, pp. 157–160. Salem, March, 1873.

Description of Eobasileus, referring this form and *Uintatherium* to the Proboscidea.

Cope, Edward Drinker.—Table of Genera of Short Footed Ungulates of the American Eocene.—Proceedings of the Academy of Natural Sciences, Vol. XXV, pp. 102, 103. Philadelphia, March, 1873.

Cope, Edward Drinker.—The Eobasileus again.—American Naturalist, Vol. VII, p. 180. Salem, March, 1873.

A denial of errors charged in regard to the *Dinocerata*.

Marsh, Othniel Charles.—Additional Observations on the Dinocerata.—American Journal of Science and Arts, Vol. V, pp. 293–296. New Haven, April, 1873.

The same, published in advance, March 18, 1873.

A correction of errors in Prof. Cope's publications, with a list of the known species of *Dinocerata*.

Abstract of same.—Nature, vol. vii, p. 491, London, April 24, 1873.

Marsh, Othniel Charles.—Supplementary Note on the Dinocerata.—American Journal of Science and Arts (3), Vol. V, pp. 310, 311. New Haven, April, 1873.

The same, published in advance, March 22, 1873.

Errors in Prof. Cope's statements and plates pointed out, and names *Loxolophodon* and *Eobasileus* rejected.

Marsh, Othniel Charles.—On the Genus *Tinoceras* and its Allies.—American Naturalist, Vol. VII, pp. 217, 218. Salem, April, 1873.

Enumeration of errors in Prof. Cope's recent papers, and remarks upon photographs of *Tinoceras cornutum*.

Garrod, Alfred Henry.—On the Affinities of *Dinoceras* and its Allies.—Nature, Vol. VII, p. 481. London, April 24, 1873.

Dinocerata regarded as belonging to the Artiodactyla.

Cope, Edward Drinker.—On some of Professor Marsh's Criticisms.—*American Naturalist*, Vol. VII, pp. 290–299 ; Plates IV–V. Salem, May, 1873. •

A denial of errors in description of *Eobasileus*, and in the dates of publications.

The same, with additions, *Palæontological Bulletin*, No. 13. Philadelphia, 1873.

Marsh, Othniel Charles.—On the dates of Professor Cope's Recent Publications.—*American Naturalist*, Vol. VII, pp. 303–306. Salem, May, 1873.

A protest against the authenticity of the dates claimed by Prof. Cope.

Marsh, Othniel Charles.—*Tinoceras* and its Allies.—*American Naturalist*, Vol. VII, pp. 306–308. Salem, May, 1873.

Correction of errors contained in Prof. Cope's recent papers.

Cope, Edward Drinker.—On the Tusk of *Loxolophodon cornutus*.—*American Naturalist*, Vol. VII, p. 315. Salem, May, 1873.

Marsh, Othniel Charles.—Notice of New Tertiary Mammals.—*American Journal of Science and Arts* (3), Vol. V, pp. 407–410. New Haven, May, 1873.

Definition of the genera *Tinoceras* and *Dinoceras*, with first description of *D. lucare*.

Abstract of same.—*Nature*, vol. viii, p. 76, London, May 22, 1873.

Marsh, Othniel Charles.—Reply to Professor Cope's Explanation.—*American Naturalist*, Vol. VII, appendix, pp. i–ix. Salem, June, 1873.

Statement in detail of the errors and incorrect dates of Prof. Cope's papers on the *Dinocerata*.

Marsh, Othniel Charles.—New Observations on the *Dinocerata*.—*American Journal of Science and Arts* (3), Vol. VI, pp. 300, 301. New Haven, October, 1873.

Additional characters of the order, and first description of *Dinoceras laticeps*.

The same, published in advance, September, 1873.

Marsh, Othniel Charles.—On the Gigantic Mammals of the American Eocene.—*Proceedings of the American Philosophical Society*, Vol. XIII, number 90, pp. 255, 256. Philadelphia, 1873.

Leidy, Joseph.—Contributions to the Extinct Vertebrate Fauna of the Western Territories.—Report of the United States Geological Survey of the Territories, F. V. Hayden, 4to, Vol. I. Washington, 1873. (Dinocerata, pp. 93–109, 331–334; Plate XXV; Plate XXVI, figs. 1–8; Plate XXVII, figs. 30–34.)

A full discussion of the structure, classification, etc., of the *Dinocerata*.

On page 95 of this memoir, Dr. Leidy in citing the description of *Dinoceras mirabile* inadvertently omitted the following: "small, compressed, osseous elevations which probably supported a pair of horns. The maxillaries have a pair of." Prof. Cope, referring apparently not to the original paper, but to this incomplete passage, has since asserted that the author placed the posterior horn-cores of *Dinoceras* on the frontal bones, a statement without foundation.

Cope, Edward Drinker.—On the Extinct Vertebrata of the Eocene of Wyoming observed by the Expedition of 1872.—United States Geological Survey of the Territories, Sixth Annual Report, F. V. Hayden, 8vo, pp. 543–649, Plates I–VI. Washington, 1873.

Discussion of the *Dinocerata*, with descriptions of this author's species, and with figures of *Tinoceras cornutum*.

Cope, Edward Drinker.—Palæontological Bulletins Nos. 1–13, 8vo, Philadelphia, 1873. Contains reproductions, among others, of the following papers, some with additions or corrections, viz:

No. 5.—Telegram from Black Buttes, Wyoming.

No. 6.—Notices of New Vertebrata from the Upper Waters of Bitter Creek, Wyoming Territory. Reprint.

No. 7.—Second Notice of Extinct Vertebrates from Bitter Creek, Wyoming. Reprint.

No. 11.—On two New Perissodactyles from the Bridger Eocene. With changes.

No. 13.—On some of Professor Marsh's Criticisms. With additions.

1874.

Marsh, Othniel Charles.—Small Size of the Brain in Tertiary Mammals.—American Journal of Science and Arts (3), Vol. VIII, pp. 66, 67. New Haven, July, 1874.

The same, published in advance, 1874.

The same.—American Naturalist, vol. viii, pp. 503, 504, Salem, August, 1874.

The same.—Annals and Magazine of Natural History (4), vol. xiv, p. 167, London, August, 1874.

Abstract of same.—Nature, vol. x, p. 273, London, August 6, 1874.

The same.—Journal de Zoologie, vol. iii, pp. 326, 327, Paris, 1874.

Abstract of same.—Neues Jahrbuch für Mineralogie, etc., p. 772, Stuttgart, 1874.

- Cope, Edward Drinker.**—Report on the Vertebrate Palæontology of Colorado.—Annual Report of the United States Geological and Geographical Survey of the Territories for 1873, F. V. Hayden, pp. 427–533, Plates I—VIII. Washington, 1874.
Description of *Eobasileus galeatus*, which, on Plate I, is called *Loxolophodon galeatus*.

- Marsh, Othniel Charles.**—On the Structure and Affinities of the Brontotheridæ.—American Journal of Science and Arts (3), Vol. VII, pp. 81–86, Plates I, II. New Haven, January, 1874.

Contains a comparison of the brain in *Brontotherium* and *Dinoceras*.

Abstract of the same.—Nature, vol. ix, p. 227, London, January 22, 1

The same.—American Naturalist, vol. viii, pp. 79–85, Salem, February, 1874.

Abstract of same.—Journal de Zoologie, vol. iii, pp. 61, 62, Paris, 1874.

1875.

- Marsh, Othniel Charles.**—Ancient Lake basins of the Rocky Mountain Region.—American Journal of Science and Arts (3), Vol. IX, pp. 49–52. New Haven, January, 1875.

Contains a description of the Eocene Lake-basin in which the *Dinocerata* are found.

Abstract of same.—American Naturalist, vol. ix, p. 119, Salem, February, 1875.

Abstract of same.—Geological Magazine (2), vol. ii, pp. 232, 233, London, May, 1875.

- Cope, Edward Drinker.**—The Feet of Bathmodon.—Proceedings of the Academy of Natural Sciences, Vol. XXVII, p. 73. Philadelphia, May, 1875.

The *Dinocerata*, from the structure of the feet, regarded as a suborder.

1876.

- Marsh, Othniel Charles.**—Principal Characters of the Dinocerata, Part I.—American Journal of Science and Arts (3), Vol. XI, pp. 163–168, Plates II–VI. New Haven, February, 1876.

Discussion of the order *Dinocerata*, with plates of the skull, brain-cast, lower jaw, and feet of *Dinoceras*.

Abstract of same.—Nature, vol. xiii, p. 374, London, March 9, 1876.

The same.—Journal de Zoologie, vol. v, pp. 136–145, Paris, 1876.

Abstract of same.—Zeitschrift für die gesammten Naturwissenschaften, vol. xiv, pp. 31, 32, Berlin, 1876.

Abstract of same.—Neues Jahrbuch für Mineralogie, etc., pp. 780, 781, Stuttgart, 1876.

Abstract of same.—Popular Science Review, pp. 326, 327, London, July, 1876.

Marsh, Othniel Charles.—The Brain of *Dinoceras*.—*American Naturalist*, Vol. X, p. 182. Boston, March, 1876.

Owen, Richard.—On the existence or not of Horns in the *Dinocerata*.—*American Journal of Science and Arts* (3), Vol. XI, pp. 401–403. New Haven, May, 1876.

Doubts expressed as to the presence of true horns in the *Dinocerata*. (See page 167 of the present volume).

Marsh, Othniel Charles.—On some of the Characters of the genus *Coryphodon*, Owen. — *American Journal of Science and Arts* (3), Vol. XI, pp. 425–428. New Haven, May, 1876.

A comparison of the brain-cast in *Coryphodon* and *Dinoceras*.

Abstract of same.—*Popular Science Review*, p. 327, London, July, 1876.

Abstract of same.—*Neues Jahrbuch für Mineralogie*, etc., p. 781, Stuttgart, 1876.

Abstract of same.—*Bibliothèque Universelle*. *Archives des Sciences Physiques et Naturelles*, vol. lvi, pp. 273, 274, Geneva, 1876.

Flower, William Henry.—On the Extinct Animals of North America.—*Popular Science Review*, Vol. XV, pp. 276–298, Plate CXXXVIII. London, July, 1876.

Contains a brief description of the *Dinocerata*, with figures of skull and hind feet of *Dinoceras*.

Marsh, Othniel Charles.—Recent Discoveries of Extinct Animals.—*American Journal of Science and Arts* (3), Vol. XII, pp. 59–61. New Haven, July, 1876.

The same, *American Naturalist*, Vol. X, pp. 436–439. Boston, July, 1876.

Abstract of same.—*Neues Jahrbuch für Mineralogie*, etc., p. 782, Stuttgart, 1876.

1877.

[Cope, Edward Drinker.]—The Lowest Mammalian Brain.—*American Naturalist*, Vol. XI, pp. 312–313. Boston, May, 1877.

Marsh, Othniel Charles.—Brain of *Coryphodon*.—*American Naturalist*, Vol. XI, p. 375. Boston, June, 1877.

Abstract of same.—*Nature*, vol. xvii, p. 340, London, February 28, 1878

Cope, Edward Drinker.—Brain of *Coryphodon*.—*Proceedings of the American Philosophical Society*, Vol. XVI, pp. 616–620, Plates I, II. Philadelphia, 1877.

Contains a comparison of brain-casts in *Coryphodon* and *Dinoceras*.

Marsh, Othniel Charles.—Principal Characters of the Coryphodontidæ.—American Journal of Science and Arts (3), Vol. XIV, pp. 81–85, Plate IV. New Haven, July, 1877.

A comparison of *Coryphodon* and *Dinoceras*, with figures of the feet in both.

The same.—Journal de Zoologie, vol. vi, pp. 380–385, Paris, 1877.

Abstract of same.—American Naturalist, vol. xi, p. 500, Boston, August, 1877.

Abstract of same.—Neues Jahrbuch für Mineralogie, etc., p. 767, Stuttgart, 1877.

Cope, Edward Drinker.—Report upon the Extinct Vertebrata obtained in New Mexico by Parties of the Expedition of 1874.—United States Geographical Surveys West of the 100th Meridian, Wheeler, Vol. IV, Palæontology, Part II, pp. 179–186, 273, 282. Washington, 1877.

Dinocerata here considered a suborder of the Amblypoda.

Marsh, Othniel Charles.—Introduction and Succession of Vertebrate Life in America.—An Address delivered before the American Association for the Advancement of Science, at Nashville, Tenn., August 30, 1877. Proceedings, Vol. XXVI, pp. 211–258, Salem, 1878.

Contains a reference to the characters and affinities of the *Dinocerata*.

*The same published in advance, pp. 1–57. 8vo. New Haven, August, 1877.

The same.—Nature, vol. xvi, pp. 448–450, 470–472, and 489–491, London, September 20, 27, and October 4, 1877.

King, Clarence.—United States Geological and Geographical Exploration of the Fortieth Parallel, Vol. I, Systematic Geology, p. 403. 4to. Washington, 1878.

A partial list of the species of *Dinocerata* occurring in the Bridger beds of the Eocene.

Osborn, Henry Fairfield; Scott, William Berryman; Speir, Francis.—Palæontological Report of the Princeton Scientific Expedition of 1877; Contributions from the Museum of Geology and Archæology of Princeton College, No. 1, 8vo, pp. 146, Plate A, and I–X. New York, 1878.

Contains (pp. 62–82, Plates VI, VII) first descriptions of *Uintatherium Leidianum* and *U. princeps*, with figures.

Ryder, John A.—On the Mechanical Genesis of Tooth Forms.—Proceedings of the Academy of Natural Sciences for 1878, pp. 45–80. Philadelphia, April, 1878.

1879.

Osborn, Henry Fairfield, and Speir, Francis.—The Lower Jaw of *Loxolophodon*.—American Journal of Science and Arts (3), Vol. XVII, pp. 304–309, Plate I. New Haven, April, 1879.

Description of the lower jaw of a female *Tinoceras*, or allied genus.

Nicholson, Alleyne.—Manual of Palæontology, 8vo, Vol. II, p. 370–373, figs. 656, 657. Edinburgh and London, 1879.

Description of the *Dinocerata*, with figures of the skull and feet of *Dinoceras mirabile*, from the present volume.

1880.

Dana, James Dwight.—Manual of Geology, Third Edition, 8vo, pp. 504, 508, Plate VII, figs. 1–4; Plate XI, fig. 1. New York, 1880.

A reference to the *Dinocerata*, with figures from the present memoir.

1881.

Cope, Edward Drinker.—On the Vertebrata of the Wind River Eocene Beds of Wyoming.—Bulletin of the United States Geological Survey, F. V. Hayden, Vol. VI, pp. 183–202. Washington, February, 1881.

Contains (pp. 194–196) first description of *Uintatherium fissidens*.

Garrod, Alfred Henry.—Dinocerata.—Journal of Anatomy and Physiology, VII, pp. 267–270. London and Cambridge, June, 1873.

The same, Complete Writings, edited by W. A. Forbes, 8vo, pp. 121–123. London, 1881.

Opinion that the *Dinocerata* belong to a family of the Artiodactyla.

Marsh, Othniel Charles.—Restoration of *Dinoceras mirabile*.—American Journal of Science (3), Vol. XXII, pp. 31, 32, Plate II. New Haven, July, 1881.

The same, published in advance, June 14, 1881.

First restoration of *Dinoceras mirabile*, new characters in the skull and sternum, and distinction stated between this genus and *Uintatherium*.

Abstract of same.—Archives des Sciences Physiques et Naturelles, vol. vi, pp. 323, 324, Geneva, September, 1881.

Osborn, Henry Fairfield.—A Memoir upon Loxolophodon and Uintatherium (Two Genera of the Sub-Order Dinocerata).—Contributions from the E. M. Museum of Geology and Archæology of the College of New Jersey, Vol. I, No. 1, 4to, pp. 54, Plates I-IV. Princeton, 1881.

A general discussion of the *Dinocerata*, and first description of *Tinoceras Speirianum*, with a restoration. The statement on page 17 in regard to the discovery of the *Dinocerata* is erroneous, as the author was nearly two years earlier in the field than is there implied. See Introduction, page 2, of the present volume.

1882.

Cope, Edward Drinker.—Contributions to the History of the Vertebrata of the Lower Eocene of Wyoming and New Mexico, made during 1881.—Proceedings of the American Philosophical Society, number 111, for 1882, pp. 139-197. Philadelphia, 1882.

Wortman, Jacob L.—The Carpal bones of the Dinocerata.—Science, Vol. I, p. 151. Cambridge, March 9, 1883.

1884.

Marsh, Othniel Charles.—The Gigantic Mammals of the Order Dinocerata. Fifth Annual Report of the United States Geological Survey, 8vo, pp. 245-302, figs. 36-137. Washington, 1884.

An extended abstract of the present volume, with 102 illustrations.

Cope, Edward Drinker.—The Amblypoda.—American Naturalist, Vol. XVIII, pp. 1110-1121, figs. 7, 8, 10. Philadelphia, November, 1884.

Contains figures of the lower jaw of *Uintatherium fissidens*.

POSTSCRIPT.

The Plates of the present volume, with their accompanying pages of explanations, were nearly all printed in 1881 and 1882, and the last of the series, in February, 1883. Most of the other illustrations, also, were completed by the latter date. In consequence of an unexpected delay in printing the text, some of the figures prepared for the Monograph first appeared elsewhere.

An extended abstract of this volume, with 102 illustrations, was prepared by the author, in July, 1884, for the Fifth Annual Report of the Director of the United States Geological Survey, and references to the pages of this Report will be found in the preceding Synopsis.

With the permission of the Director of the United States Geological Survey, an author's edition of 500 copies of this work was printed in February, 1885.

INDEX.

A.		Page.				Page.	
Amblydactyla, characters of the	176	Coryphodon hamatus, views of molar series of	52				
Amia, occurrence of, with Dinocerata remains	9	view of skull of	63				
Amynodon advenus, view of skull of	64	views of left feet of	184				
Anterior dorsal ribs, description of the	130-132	Coryphodontia and Dinocerata, characters in com-					
Artiodactyla, comparison of, with Dinocerata	181	mon of the	179				
development of foot in	188, 189	Corson, J. K., collection of specimens by	219				
Astragalus, views and description of the (Pl. XLVII)	146-151	Cranial nerves, description of the	55-57				
Atlas, views and description of the (Pl. XX)	69-71	Cuboid, views and description of the (Pl. XLIX)	153-155				
Auchenia vicugna, view of skull of	67	Cuneiform. See Pyramidal.					
Axis, views and description of the (Pl. XXI)	72, 73						
B.				D.			
Baptanodon discus, view of left hind limb of	183			Dana, J. D., references to Dinocerata in publica-			
Baur, G.; acknowledgment of aid of	XVIII	tions of	235				
Bibliography of Dinocerata	225-237	Dicotyles torquatus, view of skull of	67				
Brain, description of the	53-67	Dinoceras, place of, among Dinocerata	10				
Brain-cast, views and description of the (Pl. VI)	53-55	variation of premaxillaries in	24				
Brain-growth, description of	57-67	dentition of	41				
Brain-growth in mammals, laws regulating	58-60	brain of	56				
Bridger series	6	measurements of first metacarpal of	121				
Brontotherium beds, situation of the	6	measurements of fourth metacarpal of	126				
Brontotherium ingens, view of skull of	61	characters of the genus	191				
view of right feet of	186	list of species of, with account of specimens	194-202				
C.		Dinoceras agreste, view of skull of	19				
Calcaneum, views and description of the (Pl. XLVIII)	151-153	description of occiput of	20				
Canines, description of the	43-46	description of specimens of	197				
Capra hircus, view of left feet of	188	Dinoceras and Mastodon Americanus, comparison					
Carpal bones, description of the	101	of pelvic arch in	137				
Carter, J. V. A., collection of specimens by	196, 219	Dinoceras and Tinoceras, restorations of	165-168				
Caudal vertebræ, views and description of the (Pl. XLIII)	138	Dinoceras beds, situation of	3, 6				
Cervical vertebræ, views and description of the (Pl. XXII)	69-78	Dinoceras cuneum, views and description of sixth					
Cervus Virginianus, view of skull of	67	cervical vertebra of	77				
Chelydra serpentina, view of right fore foot of	183	measurements of sixth cervical vertebra of	78				
Cheney, H. G., collection of specimens by	195	description of specimens of	197, 198				
Chew, J. W., collection of specimens by	194, 195, 196, 198, 201, 202, 203, 208, 210, 213, 221, 222	Dinoceras distans, view of nasals of	13				
Clinodactyla, characters of the	175	view of skull of	15, 16, 29				
Colonoceras, occurrence of, with Dinocerata remains	9	description of specimens of	199				
Colonoceras agrestis, view of skull of	64	Dinoceras laticeps, view of skull of	19, 26, 30, 54				
Conclusions	169-191	description of occiput of	20				
Cope, E. D., Dinocerata collections of	4, 5	view of palate of	25				
collection of specimens by	208, 209	views and descriptions of skull of (Pl. X, XI, XIV)	26, 45				
publications of, respecting Dinocerata	226-237	views and descriptions of lower jaw of (Pl. XII, XIII)	35, 36				
Coryphodon, dentition of, contrasted with that of Dinocerata	51	measurements of lower jaw of	40				
Coryphodon and Dinocerata, comparison of astragalus in	148	view of upper canine of	43, 44				
Coryphodon beds	5, 6	view and measurements of left scaphoid of	103				
		views and descriptions of caudal vertebræ of (Pl. XLIII)	138				
		views of left astragalus of	149				
		measurements of left astragalus of	150				
		measurements of left ectocuneiform of	160				
		description of specimens of	200				
		Dinoceras lucare, maxillary bone in	28				
		views and descriptions of teeth of (Pl. IX)	43, 45, 49

PLATE I.

PLATE I.

DINOCERATA.

Skull of DINOCERAS MIRABILE, Marsh.

Two-fifths Natural Size.

Skull; oblique view, type specimen (No. 1036, Yale College Museum,)----- 11

This skull, from which the figures on the next six plates are also drawn, belonged to an animal fully adult, as shown by the teeth, but not so old as to have the cranial sutures obliterated. The right canine is restored from the left, which is perfect.
